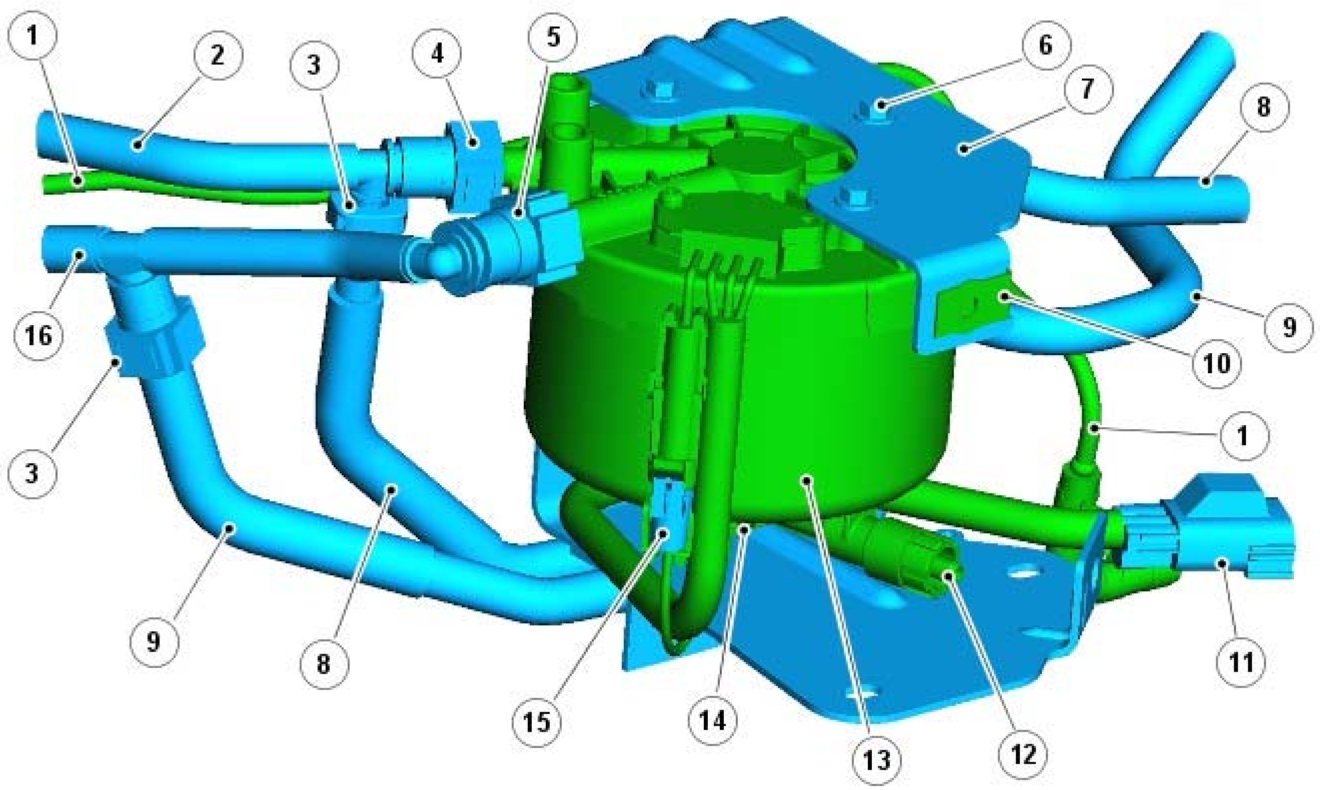
The front jet pump is mainly used when the vehicle is driving downhill. The jet pump is connected via a pipe from the fuel manifold and receives fuel at pump output pressure. Because of its location at the front of the tank, it collects fuel from the front of the tank and transfers it into the swirl pot, ensuring a constant supply of fuel to the pump. The jet pump has a jet nozzle of 1 mm diameter.

The rear jet pump operates at pump output pressure and delivers some of the fuel from the rear of the tank back into the swirl pot.

Roll Over Valves (ROVs)

Two ROVs are located on the carrier and are connected via pipes to a Liquid Vapor Separator (LVS). The LVS, which is also attached to the carrier, is connected via a pipe to the tank breather outlet in the pump module flange. The ROVs contain non-return valves which close in the event of the vehicle overturning, preventing liquid fuel escaping from the tank via the breather pipe.

FUEL FILTER



E87288

Item	Part Number	Description
1	-	FFBH supply from pump module
2	-	Fuel feed supply to filter from pump module
3	-	Quick release connector
4	-	Fuel filter inlet
5	-	Fuel filter outlet
6	-	Filter attachment bolt (3 off)
7	-	Mounting bracket
8	-	Fuel return from HP pump and fuel cooler
9	-	Fuel supply to HP pump
10	-	Heatshield attachment (2 off)
11	-	Electrical connector
12	-	Water drain valve
13	-	Filter element
14	-	Water sensor
15	-	Water sensor electrical connector
16	-	Fuel return/air bleed to tank

The fuel filter assembly is located in front of the fuel tank and is mounted on a bracket which is attached to the top face of the transfer box chassis cross member. The fuel filter assembly comprises a bracket, filter housing and the filtration element. The filter housing is secured to the bracket with 3 bolts. The bracket is secured to the cross member with 2 bolts which are screwed into threaded holes in the cross member.

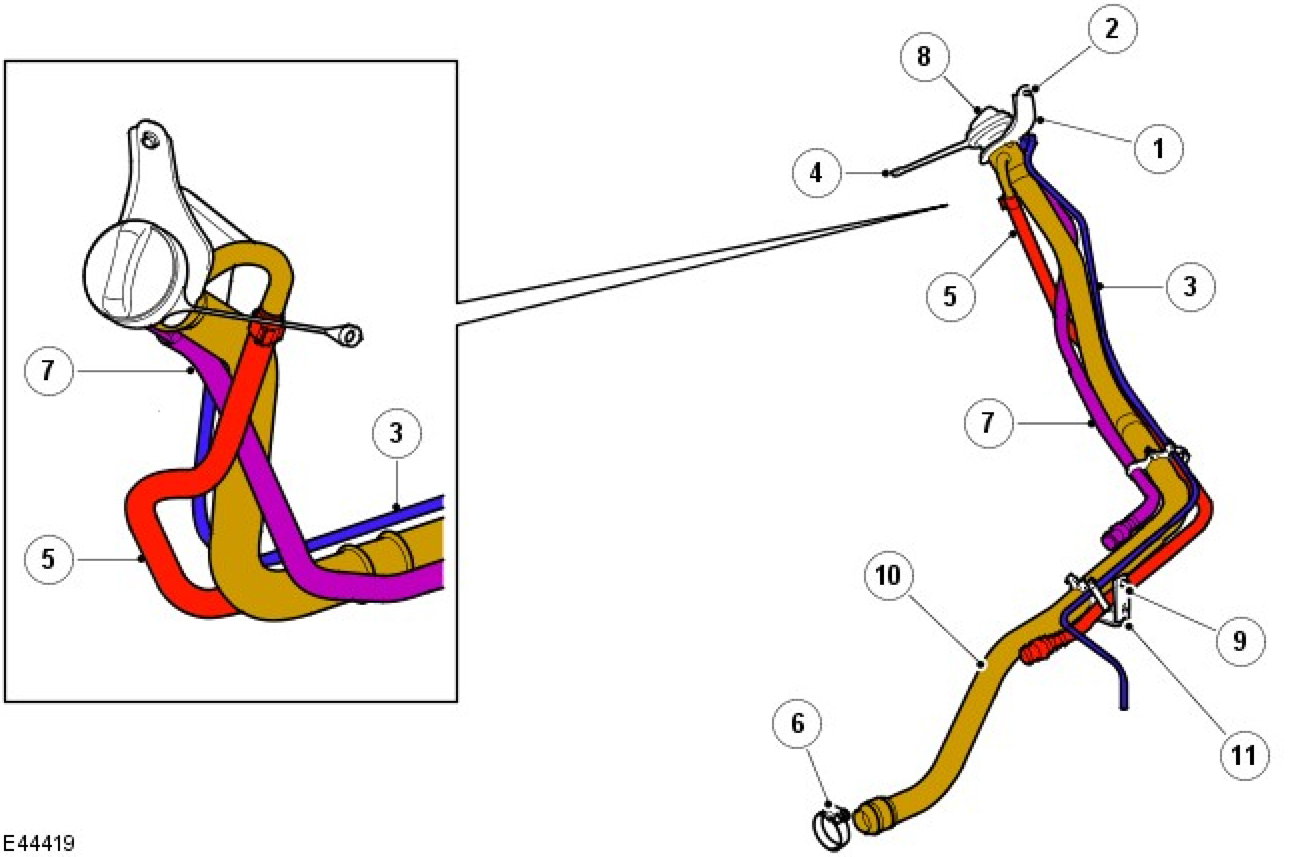
The filter housing has an inlet and outlet which allow for the attachment of hoses using quick release connectors. The filter element is located on the underside of the housing and can be removed by rotating one quarter turn to release from the housing.

The filter element has a capacity of 200 cm^3 (12.2 in^3). The filtration element can filter particulate matter larger than 2 microns. A water drain valve is located on the base of the filter. The filter can be purged of water by partially unscrewing the drain valve and allowing at least 84 cm^3 (5.12 in^3) of fuel to drain into a suitable container. The drain plug has a centre outlet which allows for the attachment of a drain hose.

The filter element also has a water sensor located in its base. The sensor is screwed into a threaded hole in the base of the element. When the filter is replaced at service, the sensor can be unscrewed from the element and installed in the new element. The sensor has an electrical connector located at the side of the element which can be disconnected to assist element removal.

The water sensor is connected to the engine control module (ECM). When the water in the element reaches 64 cm^3 (3.9 in^3) the ECM issues a high speed controller area network (CAN) bus message to the instrument cluster to display a 'WATER IN FUEL' message in the message centre.

FUEL FILLER



Item	Part Number	Description
1	-	Bracket
2	-	Screw M6
3	-	Rear differential breather pipe (Ref. only)
4	-	Filler cap lanyard
5	-	Tank breather pipe
6	-	Clamp - filler hose
7	-	Vent pipe
8	-	Filler cap
9	-	Screw M8
10	-	Filler pipe
11	-	Lower mounting bracket to Electric Park Brake (EPB) bracket

The fuel filler head is positioned at the rear of the vehicle, above the right hand rear wheel. The filler head is covered by a moulded plastic cover which is electrically locked when the vehicle is locked. The filler cap is a conventional screw in type which is secured to the vehicle with a lanyard.

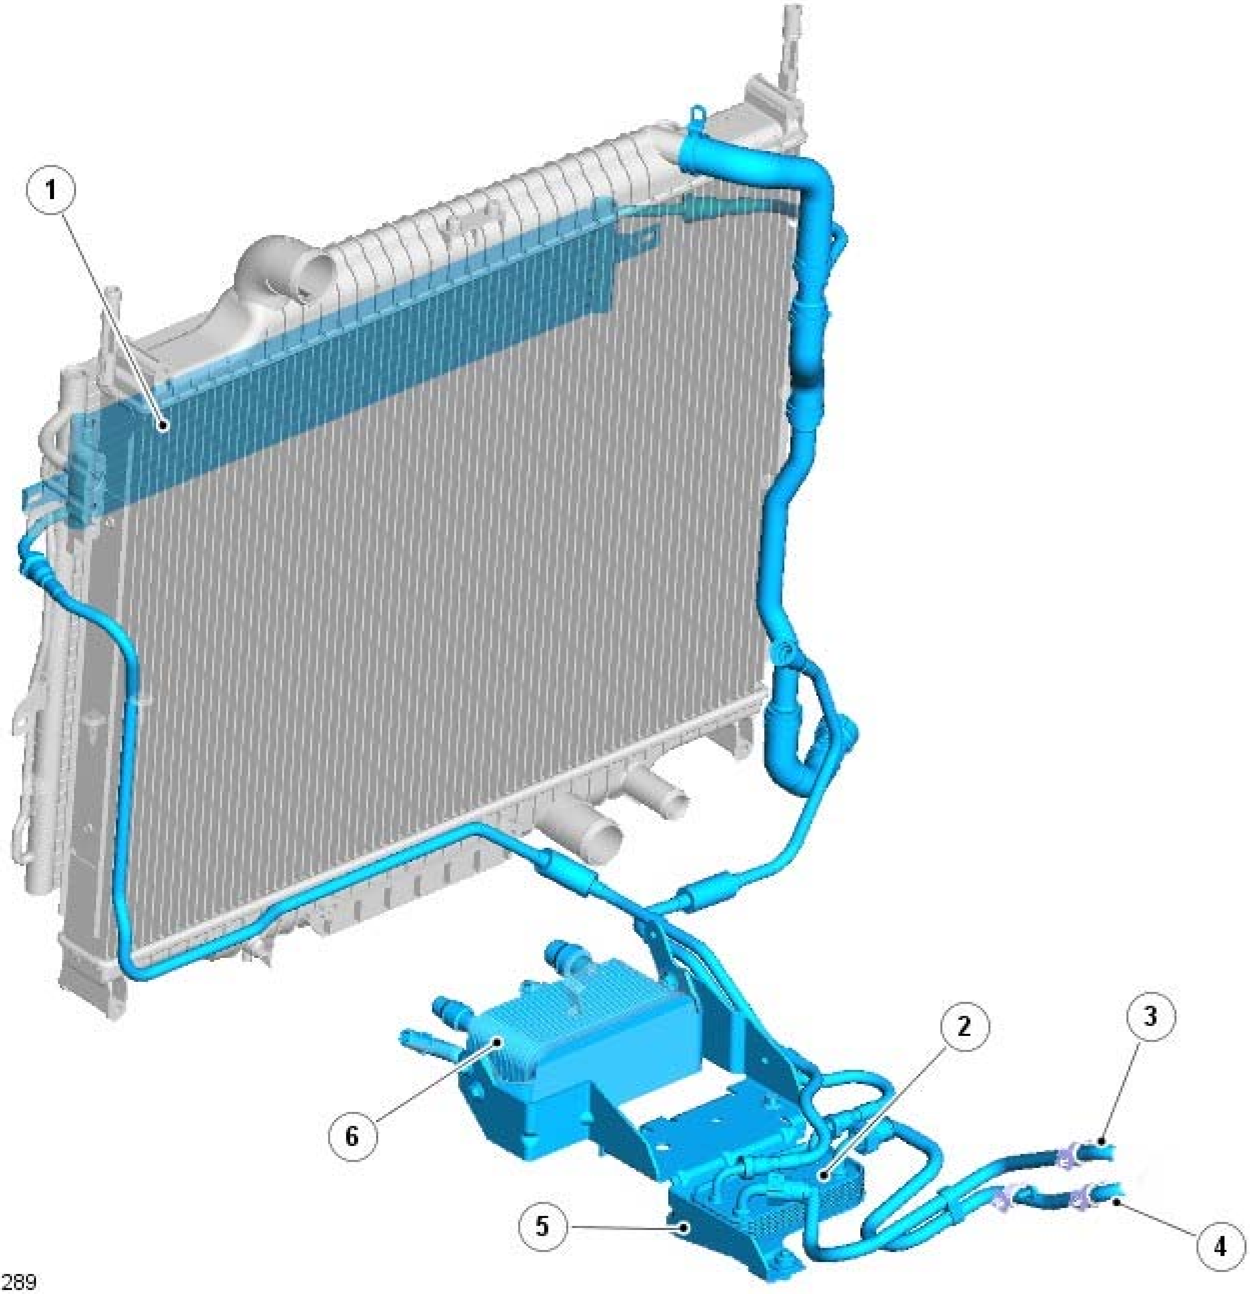
- NOTE: The fuel filler head plastic cover does not lock on NAS vehicles.

The filler head is a stainless steel fabrication. Two brackets provide for the attachment of the filler head to the vehicle body and the chassis electronic park brake bracket.

A connection on the rear of the filler head allows for the connection of the fuel tank breather pipe from the fuel tank breather stub. The fuel tank breather pipe has a quick release fitting and connects to the breather pipe from the fuel tank breather stub. The fuel filler vent pipe from the tank is vented to atmosphere. The vent pipe incorporates an insect trap at its termination near the filler head. The fuel filler pipe locates in a short flexible hose attached to the tank and is secured with a worm drive clamp.

A smaller pipe, which is not associated with the fuel system, is attached to the side of the fuel filler pipe. This pipe connects to the rear differential and provides breathing for the differential case. The pipe terminates near the fuel filler head.

FUEL COOLER



Item	Part Number	Description
1	-	Fuel cooler engine coolant radiator
2	-	Fuel cooler
3	-	Fuel return from HP pump
4	-	Fuel return from cooler to fuel filter
5	-	Bracket
6	-	Transmission fluid cooler (ref)

The fuel cooler uses engine coolant, direct from a dedicated additional engine coolant radiator located in front of the main radiator. This passes the cold coolant through the fuel cooler to cool fuel returning to the fuel filter from the HP injection pump.

The fuel cooler is located below the engine and shares a common mounting bracket with the transmission fluid cooler. The bracket has two slots which accept two plastic pegs which are attached to the cooler. A bolt is inserted through a hole in the bracket and screws into a captive nut on the cooler to positively secure the cooler to the bracket.

The cooler has four quick fit connector pipes which provide for the attachment of the fuel inlet hose from the HP injection pump, the fuel outlet hose to the fuel filter, the coolant inlet hose from the radiator and the coolant outlet hose to the coolant thermostat housing. The coolant pipes can be identified by their smaller diameter.

Fuel Tank and Lines - TDV8 3.6L Diesel - Fuel Tank and Lines

Diagnosis and Testing

Overview

For information on the fuel system description and operation:
REFER to: Fuel Tank and Lines (310-01D Fuel Tank and Lines - TDV8 3.6L Diesel, Description and Operation).

Inspection and Verification

WARNING: Make sure that all suitable safety precautions are observed when carrying out any work on the fuel system. Failure to observe this warning may result in personal injury.

CAUTION: Make sure that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in damage to the vehicle.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual Inspection

Mechanical	Electrical
● Fuel level ● Contaminated fuel ● Fuel supply line(s) ● Fuel return line(s) ● High-pressure fuel supply line(s) ● Fuel tank filler pipe ● Fuel leak(s) ● Fuel tank ● Fuel filler cap ● Fuel filter ● Push connect fittings ● Fuel rail ● Fuel injection pump ● Exhaust gas recirculation (EGR) system	● Battery charge and condition ● Fuse(s) ● Inertia fuel shutoff (IFS) switch ● Fuel pump module (lift pump) ● Fuel pump module relay ● Electrical connector(s) ● Damaged or corroded wiring harness ● Fuel volume control valve ● Fuel pressure control valve ● Engine control module (ECM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
   - Make sure that all DTCs are cleared following rectification.

Symptom Chart

Symptom	Possible causes	Action
Engine cranks, but does not start	● Inertia fuel shutoff (ISF) switch ● Low/Contaminated fuel ● Air leakage ● Low-pressure fuel system fault ● Fuel pump module (lift pump) fault ● Blocked fuel filter ● Fuel volume regulator blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● Fuel pump fault ● Crankshaft position (CKP) sensor	Check that the ISF switch has not tripped. Check the fuel level and condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the intake air system for leaks. Check for DTCs. Check the lift pump operation, check the low-pressure fuel system for leaks/damage. Check the fuel filter, check the fuel volume and pressure control valves and circuits. Refer to the electrical guides. Check the fuel pump: REFER to: Fuel Charging and Controls (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, Diagnosis and Testing). Check the CKP sensor circuits. Refer to the electrical guides.

DTC Index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: For a full list of ECM DTCs:
REFER to: Electronic Engine Controls (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Diagnosis and Testing).

DTC	Description	Possible causes	Action
P008700	Fuel rail/system pressure too low	● Fuel rail pressure (FRP) sensor disconnected ● FRP sensor to ECM sensing circuit short circuit to ground	Refer to the electrical guides and check the FRP sensor circuits. For FRP sensor tests, refer to the relevant workshop manual section. Check the low pressure fuel lines for damage or restrictions. Check the fuel pressure. Check the low pressure fuel pump module circuits and operation. Check for fuel rail and high pressure fuel line leaks. Check for VCV and PCV DTCs and rectify as necessary.

DTC	Description	Possible causes	Action
		● FRP sensor supply circuit high resistance ● FRP sensor failure ● Fuel line leak ● Restricted fuel line ● Fuel pump module circuit high resistance ● Fuel pump module circuit short circuit to ground ● Fuel pump module failure ● Volume control valve fault ● Pressure control valve fault	
P008800	Fuel rail/system pressure too high	● Fuel rail pressure (FRP) sensor to ECM wiring (supply/sense) short circuit to each other ● FRP sensor to ECM sense circuit short circuit to power ● FRP sensor failure ● Fuel pressure control valve (FPCV) fault ● Fuel pump module circuit short circuit to power ● Fuel pump module failure	Check the FRP sensor circuits. Refer to the electrical guides. For FRP sensor tests, refer to the relevant workshop manual section. Check the fuel lines, check the fuel pressure and the fuel pump module circuits.
P062712	Fuel Pump A Control Circuit / Open	● Fuel pump relay control circuit short circuit to power ● Fuel pump relay fault	Check the fuel pump and circuits. Refer to the electrical guides. Activate the relay and listen for an audible 'click'. Refer to the relevant workshop manual section. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P062811	Fuel Pump A Control Circuit Low	● Fuel pump relay control circuit short circuit to ground ● Fuel pump relay fault	Check the fuel pump and circuits. Refer to the electrical guides. Activate the relay and listen for an audible 'click'. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P062913	Fuel Pump A Control Circuit High	● Fuel pump relay control circuit high resistance ● Fuel pump relay control circuit open circuit ● Fuel pump relay fault	Check the fuel pump and circuits. Refer to the electrical guides. Activate the relay and listen for an audible 'click'. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P115A68	Low Fuel Level - Forced Limited Power	● Low fuel level - forced limited power - event information (anti air suction intervention occurred) ● Low fuel ● Fuel level sensor circuit short circuit	Check that there is sufficient fuel in the tank. Check the fuel level sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new fuel level sensor. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
		to ground ● Fuel level sensor circuit high resistance ● Fuel level sensor fault	
P115B68	Low Fuel Level - Forced Engine Shutdown	● Low fuel level - forced engine shutdown - event information (anti air suction intervention occurred) ● Low fuel ● Fuel level sensor circuit short circuit to ground ● Fuel level sensor circuit high resistance ● Fuel level sensor fault	Check that there is sufficient fuel in the tank. Check the fuel level sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new fuel level sensor. Clear the DTCs and test for normal operation.
P213F07	Fuel Injection System Fault Forced Engine Shutdown	● Engine stop by hydraulic	Check for associated DTCs and Repair/renew as necessary. If this DTC resets, contact the technical help desk.
P226413	Water in Fuel Sensor Circuit	● Sensor circuit high resistance	Check the sensor and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P226532	Water in Fuel Sensor Circuit Range/Performance	● Water in fuel sensor connector fault - signal low time less than minimum - Initialization error, edge too short ● Water in fuel sensor circuit fault	Check the sensor and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P226533	Water in Fuel Sensor Circuit Range/Performance	● Water in fuel sensor connector fault - signal low time greater than maximum ● Water in fuel sensor circuit fault	Check the sensor and circuits. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.
P226611	Water in Fuel Sensor Circuit Low	● Sensor circuit short circuit to ground	Check the sensor and circuits. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.
P226968	Water in Fuel Condition	● Water in fuel condition ● Water in fuel sensor circuit short circuit to ground ● Water in fuel sensor fault	Drain the water from the fuel filter. Clear the DTC and retest. If the DTC resets, check the sensor circuit. Refer to the electrical guides. If no fault is found in the circuits, install a new sensor.
P229000	Injector Control Pressure Too Low	● Fuel leak (high or low-pressure system) ● Fuel filter/line fault ● Air lock in injection pump ● Fuel pump fault	There are different approaches to this depending on whether or not the vehicle runs. If the vehicle does **not** run: remove the lift pump fuse (fuse 1E of the engine compartment junction box). Disconnect the volume control valve connector from the rear of the injection pump. Disconnect the fuel spill lines and direct into a suitable container through a length of clear pipe. Crank the engine to at least 250 rpm for a minimum of 15 seconds. The pump spill flow should be at least 160 ml/min. If the spill flow is greater than this, install a new injection pump. REFER to: Fuel Pump (303-04D Fuel Charging and Controls - TDV8

DTC	Description	Possible causes	Action
			3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation. If the spill flow is less than 160 ml/min, carry out the low-pressure bleeding procedure. REFER to: Low-Pressure Fuel System Bleeding - TDV6 2.7L Diesel (310-00 Fuel System - General Information, General Procedures). Recheck the spill flow, if it is still less than 160 ml/min, install a new fuel pump. REFER to: Fuel Pump (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation. If the vehicle **does** run, install a new fuel filter and run the engine at 3,000 rpm for 3 minutes. During this, monitor the fuel pressure using a data logger function. If there is an airlock in the pump, the fuel pressure will be low and unstable, but a high-speed run should clear this. If the fault does not clear, check the low-pressure system to the injection pump. Insert a length of clear pipe into the fuel line and check for a steady flow of fuel with no air bubbles. If the low-pressure system checks out, disconnect the fuel injector electrical connectors and check connections. Direct the lines into a suitable container and crank the engine. Compare the flow from the injectors and if there is one or more with low flow, install a new injector to that cylinder. REFER to: (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel) Fuel Injectors LH (Removal and Installation), Fuel Injectors RH (Removal and Installation). Clear the DTCs and test for normal operation. If the fault does not clear, install a new injection pump. REFER to: Fuel Pump (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.

Fuel Tank and Lines - TDV8 3.6L Diesel - Fuel Cooler

Removal and Installation

Removal

- WARNINGS:

⚠ Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

⚠ Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

⚠ Release the cooling system pressure by slowly turning the coolant expansion tank cap a quarter of a turn. Cover the expansion tank cap with a thick cloth to prevent the possibility of scalding. Failure to follow this instruction may result in personal injury.

⚠ The spilling of fuel is unavoidable during this operation. Make sure that all necessary precautions are taken to prevent fire and explosion.

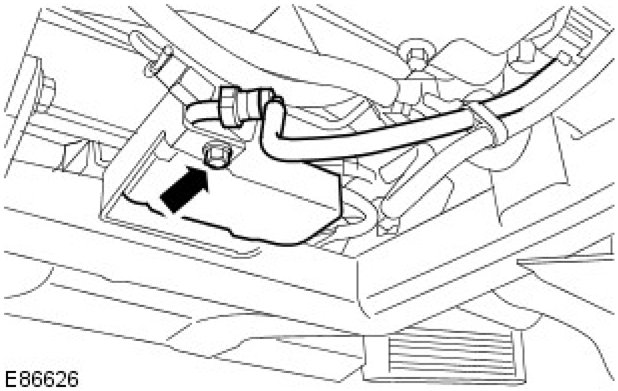
⚠CAUTION: Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

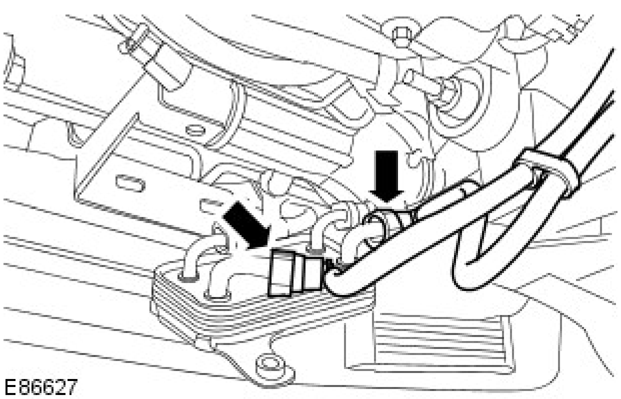
1. Raise and support the vehicle.

2. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

3. Release the fuel cooler.

- Remove the bolt.

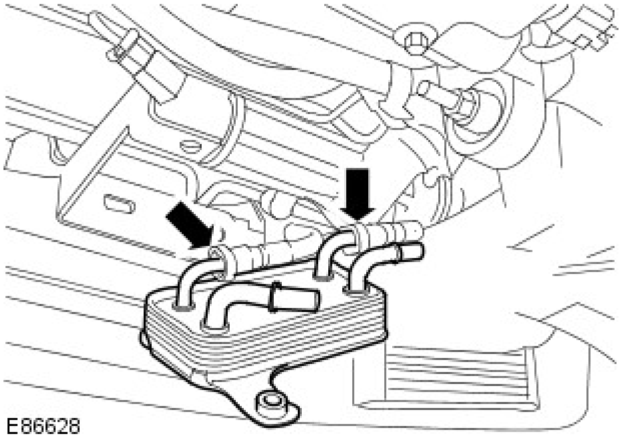




4. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Disconnect the 2 fuel lines.

- Position a container to collect the fluid spillage.



5. CAUTIONS:

⚠ Make sure that all openings are sealed. Use new blanking caps.

⚠ Make sure that the area around the component is clean and free of foreign material.

Remove the fuel cooler.

- Disconnect the 2 coolant lines.

Installation

1. NOTE: Remove and discard the blanking caps.

Install the fuel cooler.

- Connect the coolant lines.

2. NOTE: Remove and discard the blanking caps.

Connect the fuel lines.

- Remove the container.

3. Secure the fuel cooler.

- Tighten the bolt to 23 Nm (17 lb.ft).

4. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

5. Carry out the low-pressure fuel system bleeding.
For additional information, refer to: Low-Pressure Fuel System Bleeding - TDV6 2.7L Diesel (310-00 Fuel System - General Information, General Procedures).

6. Check and top-up the coolant.

Removal and Installation

Removal

- WARNINGS:

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

If taken internally, do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

The spilling of fuel is unavoidable during this operation. Make sure that all necessary precautions are taken to prevent fire and explosion.

- CAUTIONS:

Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

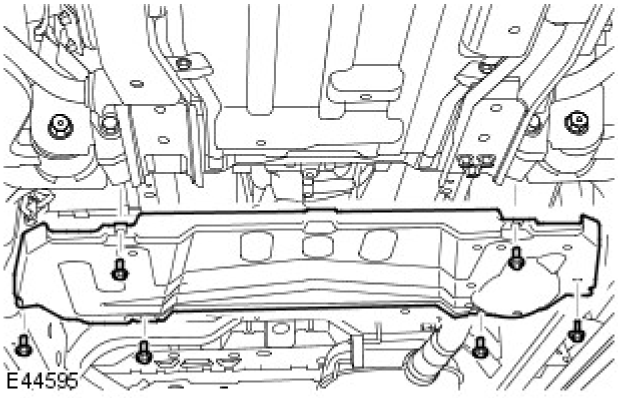
Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

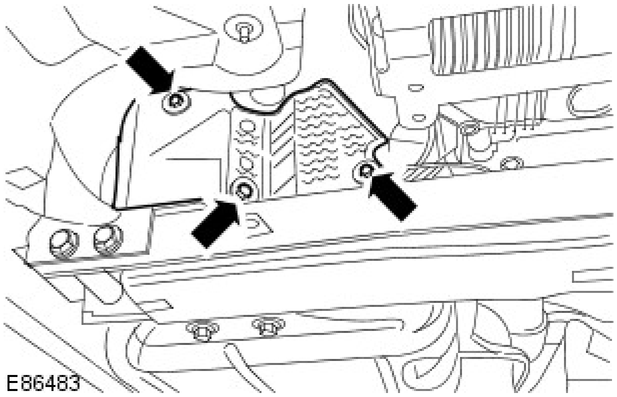
1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the transmission undershield.

- Remove the 6 bolts.



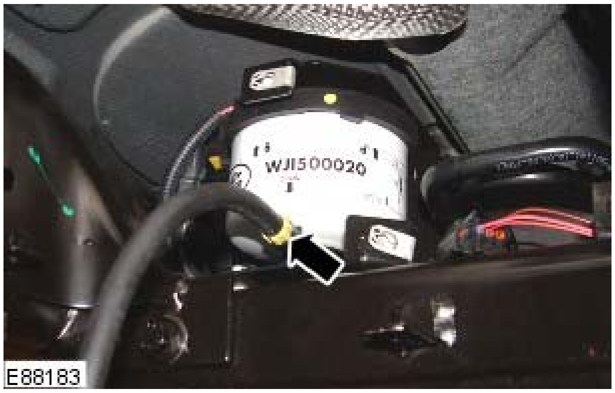


E86483

3. ⚠ WARNING: Observe due care when working near a hot exhaust system.

Remove the fuel filter heat shield.

- Remove the 3 bolts.

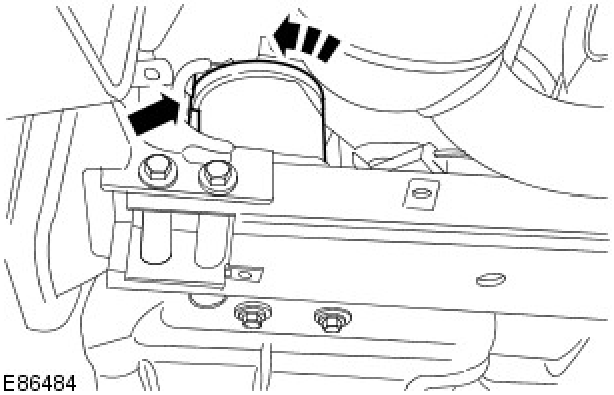


E88183

4. ⚠ CAUTION: Make sure the water-in-fuel sensor remains in the aligned position.

Drain the fuel filter element.

- Position a container to collect the fluid spillage.
- Loosen the nut.
- Attach a suitable drain tube to the water-in-fuel sensor drain port.
- Remove the drain tube.
- Tighten the nut.



E86484

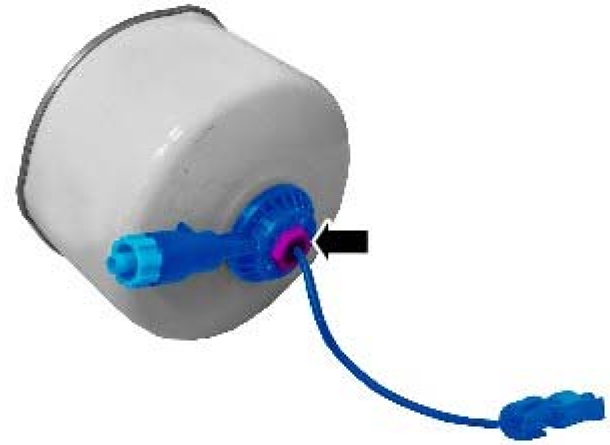
5. ⚠ CAUTION: Make sure that the area around the component is clean and free of foreign material.

Remove the fuel filter element.

- Disconnect the water-in-fuel sensor electrical connector.

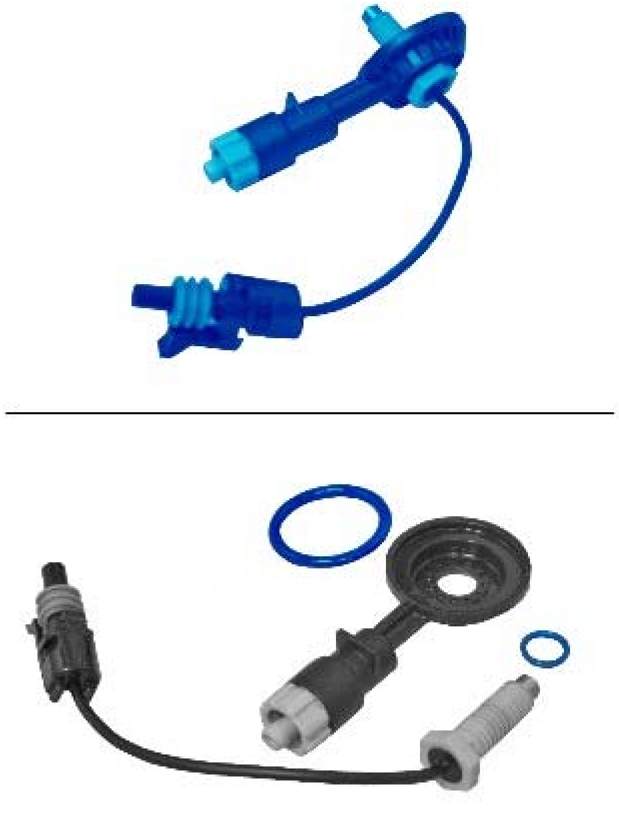
6. Remove the water-in-fuel sensor.

- Discard the fuel filter element.



E138939

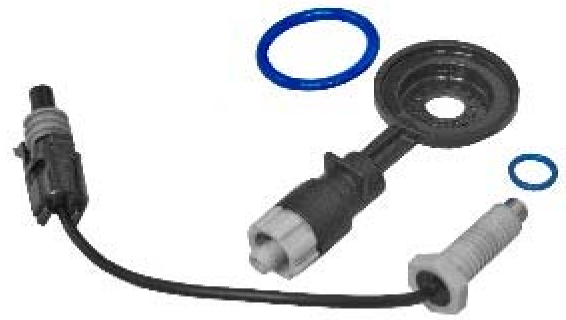
7. Remove and discard the O ring seals.

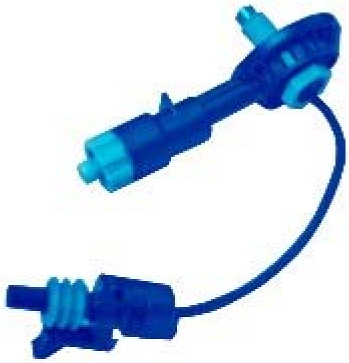


E138941

Installation

1. Install new O ring seals.





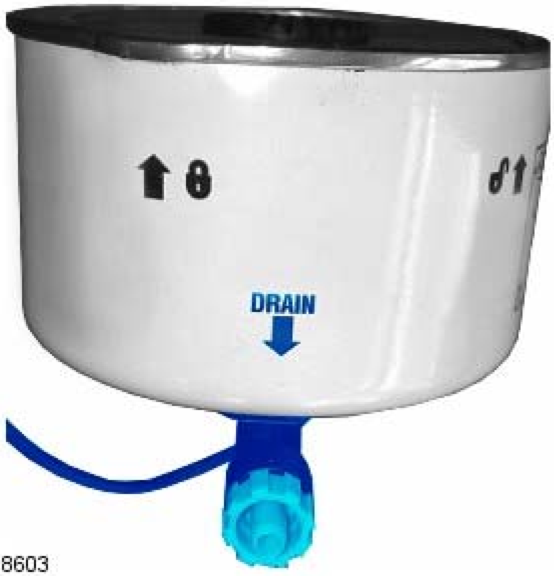
E138940

2. ⚠CAUTION: Make sure that the mating faces are clean and free of foreign material.

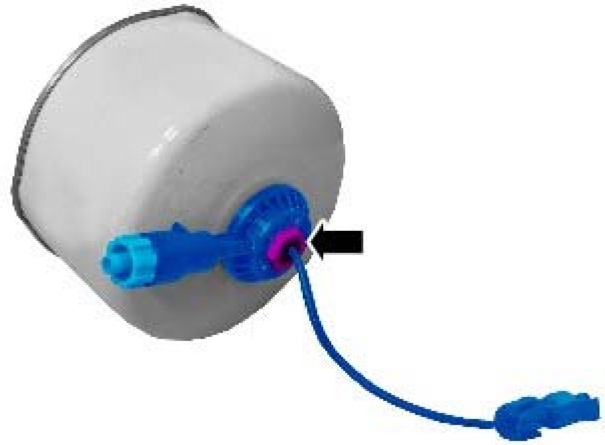
• NOTE: Make sure that the water-in-fuel sensor is aligned with the drain arrow.

Install the water-in-fuel sensor.

- Remove and discard the water-in-fuel drain plug from the new fuel filter element.



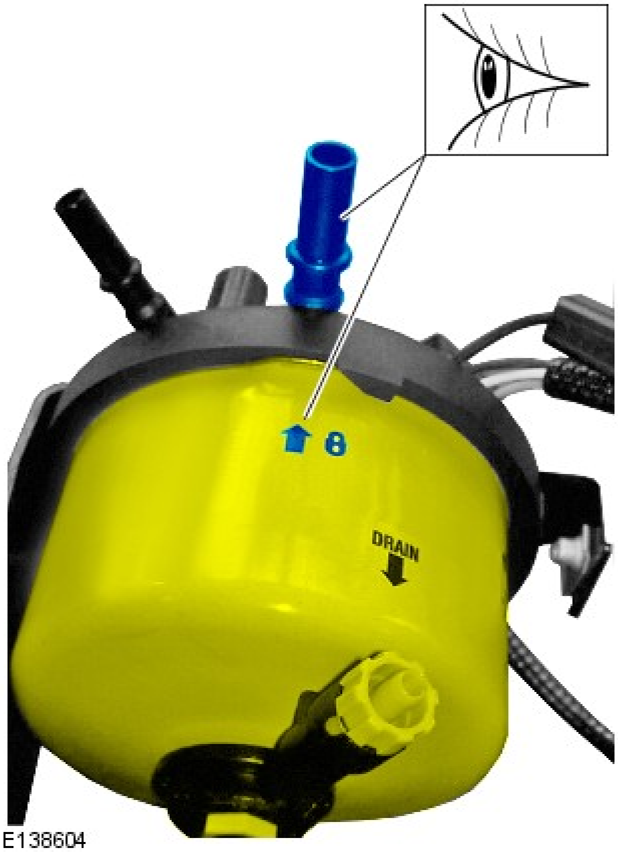
E138603



E138939

3. CAUTION: Make sure the water-in-fuel sensor remains in the aligned position.

Tighten the plastic nut to 1.6 Nm.

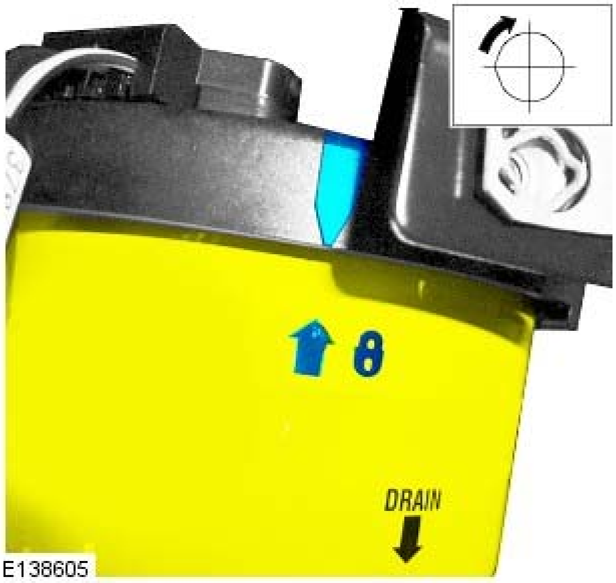


E138604

4. NOTE: Make sure that the fuel filter element is correctly aligned. Failure to follow this instruction may result in damage to the vehicle.

Install the fuel filter element.

1. Insert the fuel filter with the the lock symbol arrow aligned with the inlet pipe on the fuel filter housing.



5. NOTE: Make sure that the fuel filter element is correctly aligned. Failure to follow this instruction may result in damage to the vehicle.

Rotate to tighten and seal the fuel filter element.

1. When tightened correctly, the lock symbol arrow should be aligned with the arrow symbol on the fuel filter housing.

- Connect the water-in-fuel sensor electrical connector.
- Remove the container.

6. Install the fuel filter heat shield.

- Tighten the bolts to 6 Nm.

7. Install the transmission undershield.

- Tighten the bolts to 10 Nm.

8. Carry out the low-pressure fuel system bleeding.

Removal and Installation

Removal

- WARNINGS:

Place the vehicle in a well ventilated, quarantined area and arrange ' No Smoking/Petrol Fumes' signs about the vehicle.

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

- NOTE: The fuel pump module comprises of a rear fuel level sender and a fuel pressure regulator. These components cannot be serviced separately.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

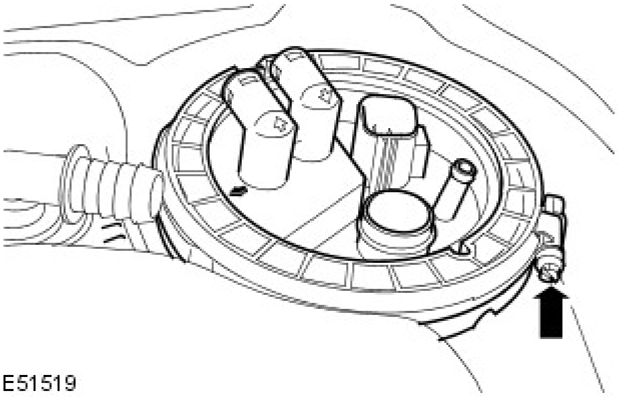
3. Remove the fuel tank.
For additional information, refer to: Fuel Tank (310-01D Fuel Tank and Lines - TDV8 3.6L Diesel, Removal and Installation).

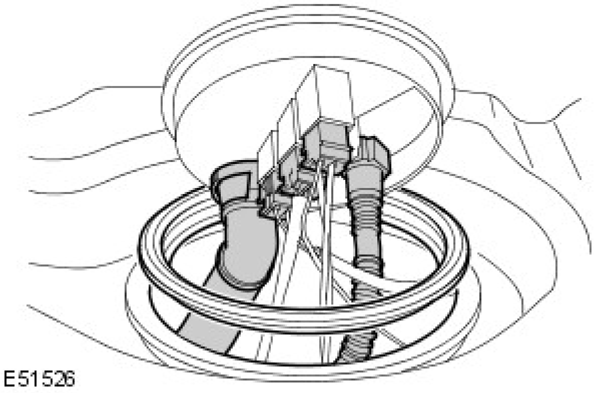
4. CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

- NOTE: Note the fitted position.

Release the fuel pump module access flange.

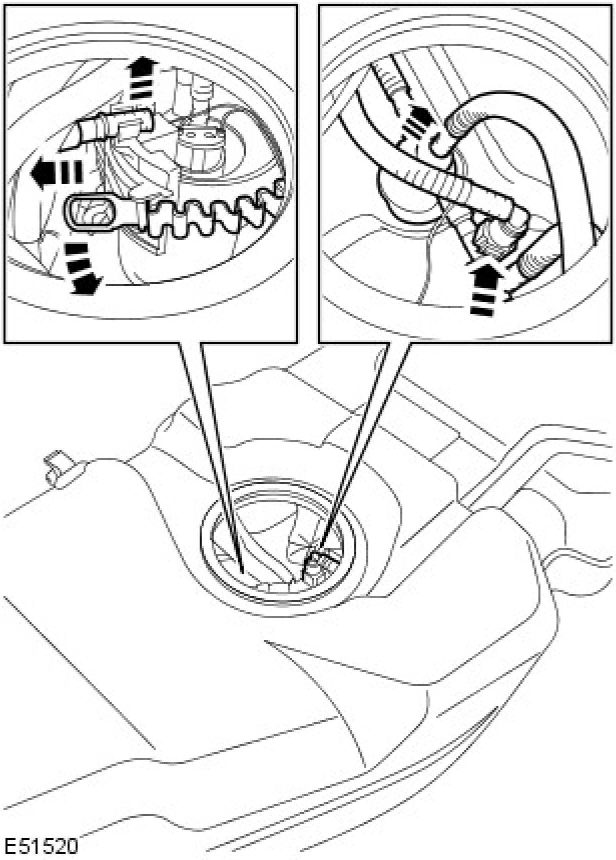
- Loosen the screw.
- Remove the clamp.





5. Remove the fuel pump module access flange.

- Disconnect the vent line.
- Disconnect the fuel supply line.
- Disconnect the 3 electrical connectors.
- Remove and discard the seal.



6. Remove the fuel pump module.

- Release the strap.
- Release the fuel pressure regulator.
- Disconnect the 2 fuel lines.

Installation

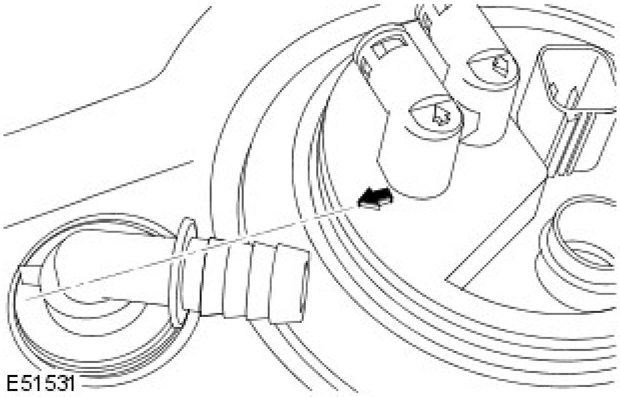
1. Install the fuel pump module.

- Connect the fuel lines.
- Secure with the strap.
- Secure the fuel pressure regulator.

2. Install the fuel pump module access flange.

- Clean the component mating faces.
- Install a new seal.
- Connect the 3 electrical connectors.

- Connect the fuel supply line.
- Connect the vent line.



3. ⚠ CAUTION: Make sure the seal is correctly fitted.

• NOTE: Align to the position noted on removal.

Secure the fuel pump module access flange.

- Install the clamp.
- Tighten the screw to 4 Nm (3 lb.ft).

4. Install the fuel tank.
For additional information, refer to: Fuel Tank (310-01D Fuel Tank and Lines - TDV8 3.6L Diesel, Removal and Installation).

5. Connect the battery ground cable.

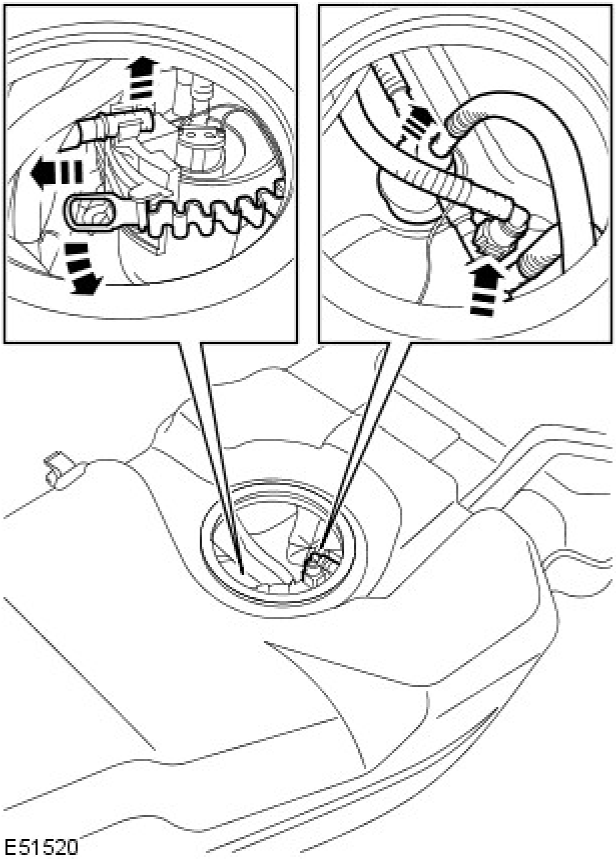
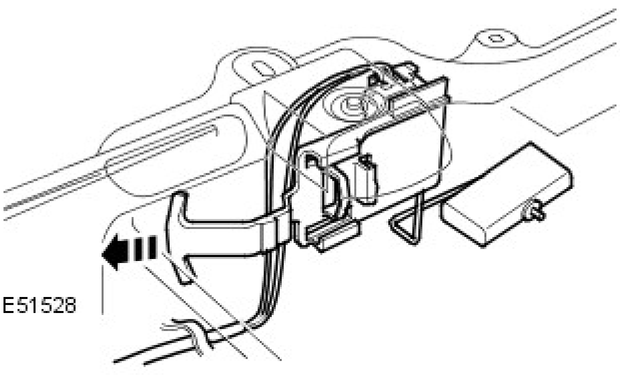
- Remove and discard the seal.



E51520

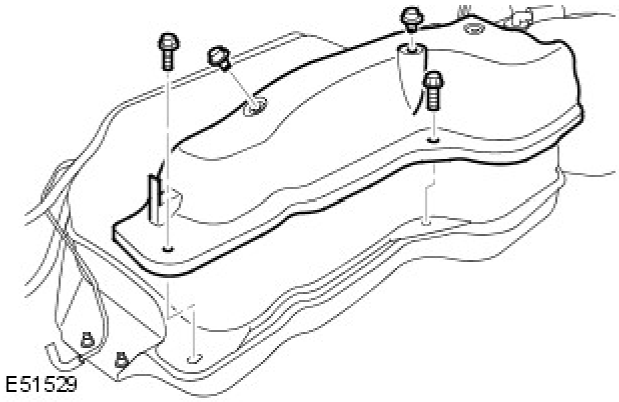
17. Remove the fuel pump module.

- Release the strap.
- Release the fuel pressure regulator.
- Disconnect the 2 fuel lines.



18. Remove the fuel tank front fuel level sender unit.

- Release the lead.
- Release the clip.



19. Remove the fuel tank bracket.

- Remove the 2 clips.
- Remove the 2 bolts.
- Remove the retaining plate.

Installation

All vehicles

1. Install the fuel tank bracket.

- Install the retaining plate.
- Install the clips.
- Tighten the bolts to 10 Nm (7 lb.ft).

2. Install the fuel tank front fuel level sender unit.

- Secure the clip.
- Secure the lead.

3. Install the fuel pump module.

- Connect the fuel lines.
- Secure with the strap.
- Secure the fuel pressure regulator.

4. Install the fuel pump module access flange.

- Clean the component mating faces.
- Install a new seal.
- Connect the 3 electrical connectors.
- Connect the fuel supply line.

- Connect the vent line.

5. ⚠ CAUTION: Make sure the seal is installed correctly.

• NOTE: Align to the position noted on removal.

Secure the fuel pump module access flange.

- Install the clamp.
- Tighten the screw to 4 Nm (3 lb.ft).

6. With assistance, install the fuel tank to the transmission jack.

7. Position the fuel tank to the vehicle.

8. Connect the fuel lines.

- Secure with the clip.

Vehicles with fuel fired heater

9. Connect the fuel fired booster heater fuel line.

- Secure with the clip.

10. Connect the vent lines.

- Secure with the clip.

11. Connect the electrical connector.

12. Secure the fuel and vent lines.

- Secure in the clips.
- Install the retainers.
- Install the adhesive pad.

13. Install the fuel tank.

- Tighten the bolts to 45 Nm (33 lb.ft).

14. ⚠ CAUTION: Tighten the new tamper proof clip until the hexagon shears.

Connect the fuel filler neck.

- Install a new retaining clip.

15. Install the fuel tank heat shield.

- Tighten the bolts to 6 Nm (4 lb.ft).
- Tighten the nuts to 3 Nm (2 lb.ft).

16. Refill the fuel tank.
For additional information, refer to: Fuel Tank Draining (310-00 Fuel System - General Information, General Procedures).

Removal and Installation

Removal

- WARNINGS:

⚠ Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Position the vehicle on a lift.

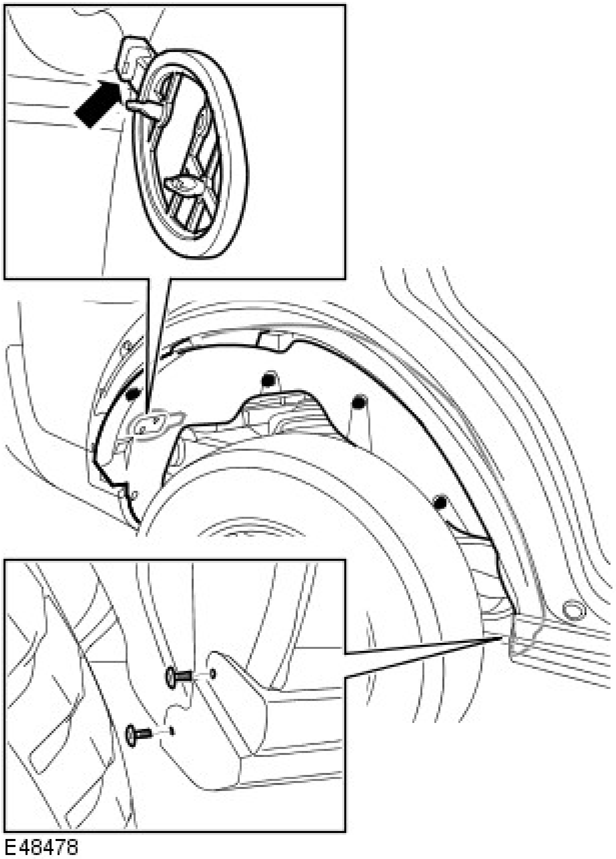
2. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

3. Drain the fuel tank.
For additional information, refer to: Fuel Tank Draining (310-00 Fuel System - General Information, General Procedures).

4. Remove the RH rear wheel and tire.

5. Remove the fender splash shield.

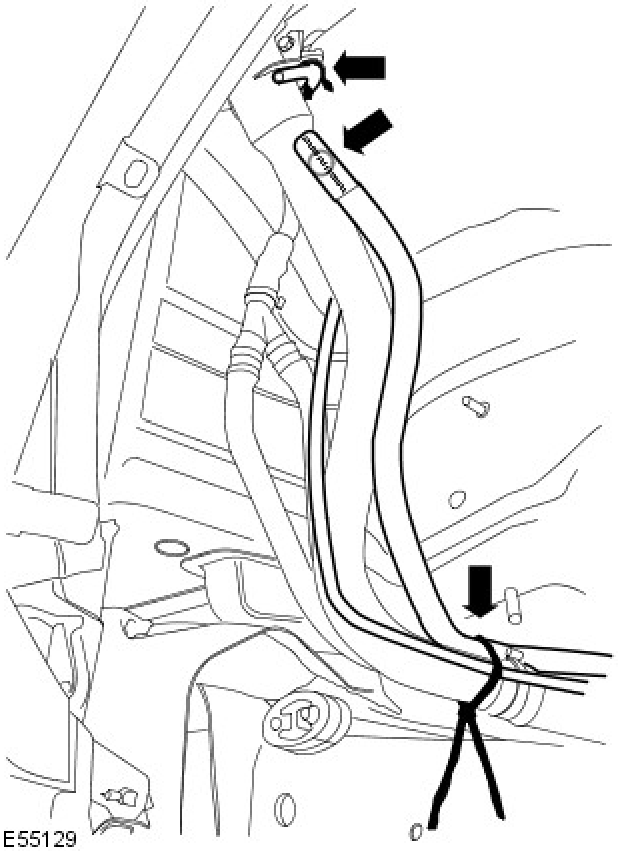
- Remove the 2 screws.
- Remove the 6 retainers.
- Disconnect the electrical connector.



E48478

6. Remove the fuel filler door.
For additional information, refer to: Fuel Filler Door Assembly (501-03 Body Closures, Removal and Installation).

7. Remove the spare wheel and tire.



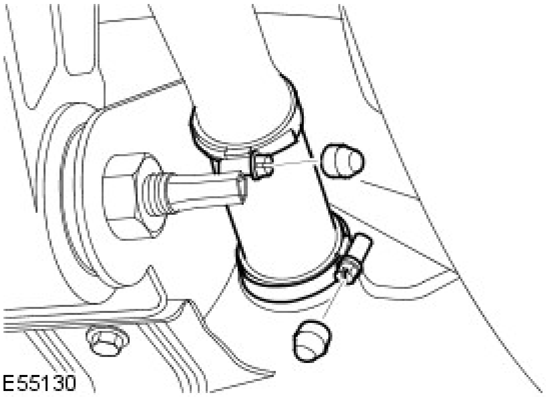
8. Disconnect the breather pipes.

- Remove the clip.
- Release the 2 clips.
- Remove and discard the cable tie.

9. ⚠CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

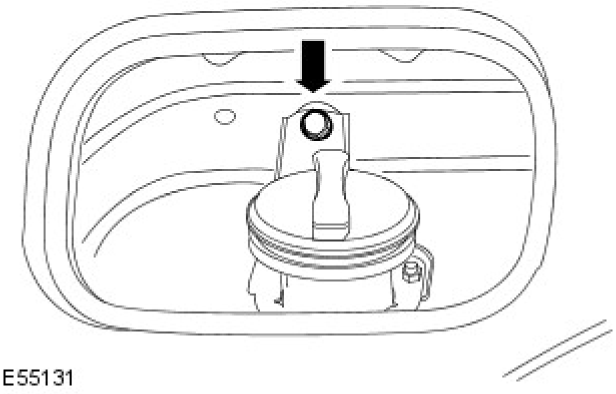
Disconnect the fuel filler neck from the fuel tank.

- Remove the tamper proof cover.
- Remove and discard the hose clip.



10. Remove the fuel tank filler pipe connector hose.

- Remove the tamper proof cover.
- Remove and discard the hose clip.



11. NOTE: Note the fitted position.

Remove the fuel tank filler pipe.

- Remove the bolt.

Installation

1. Install the filler pipe connector hose.

- Install the new tamper proof clip.

2. NOTE: Align to the position noted on removal.

Install the fuel tank filler pipe.

- Install the bolt and tighten to 10 Nm (7 lb.ft).

3. ⚠ CAUTION: Tighten the new tamper proof clip until the hexagon shears.

Connect the fuel filler neck.

- Install a new retaining clip.

4. Connect the breather pipes.

- Secure the clips.

5. Install the filler door.
For additional information, refer to: Fuel Filler Door Assembly (501-03 Body Closures, Removal and Installation).

6. Install the fender splash shield.

7. Install the wheel and tire.

8. Install the spare wheel and tire.

9. Refill the fuel tank.

10. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Published: 11-May-2011

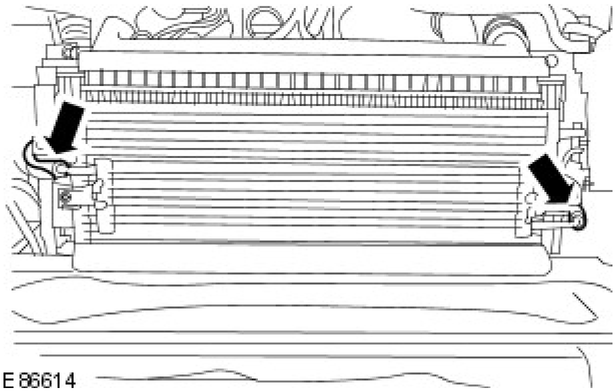
Fuel Tank and Lines - TDV8 3.6L Diesel - Auxiliary Fuel Cooler

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

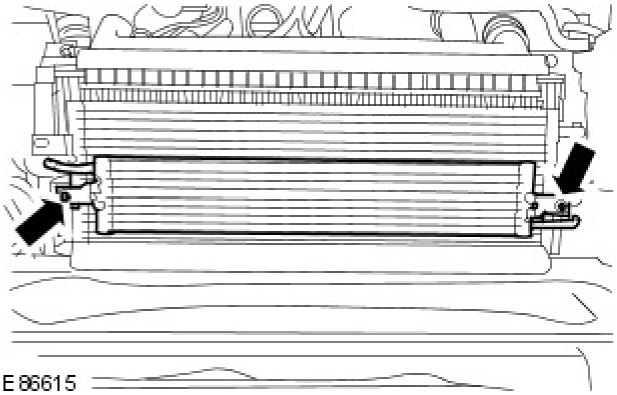
2. Remove the radiator grille.
For additional information, refer to: Radiator Grille (501-08 Exterior Trim and Ornamentation, Removal and Installation).



3. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Disconnect the 2 coolant pipes from the auxiliary fuel cooler.

- Release the 2 quick release connectors.



4. Remove the auxiliary fuel cooler.

- Remove the 2 bolts.

Installation

1. Install the auxiliary fuel cooler.

- Tighten the bolts to 5 Nm (4 lb.ft).

2. NOTE: Remove and discard the blanking caps.

Connect the coolant pipes to the auxiliary fuel cooler.

3. Install the radiator grille.
For additional information, refer to: Radiator Grille (501-08 Exterior Trim and Ornamentation, Removal and Installation).

4. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

5. Check and top-up the coolant.

Capacity

Usable fuel tank capacity	84.0 liters (18.5 gallons) (22.19 US gallons)

General Specification

Item	Specification
System type	Mechanical - returnless
Fuel delivery module	Located in the fuel tank
High pressure fuel pump:	
Location	Located at the front of the engine on the LH cylinder head, gear driven from the camshaft
Maximum operating pressure	165000 kPa (1650 bar) (23925 lb/in²)
Advance delivery fuel pump:	
Location	Located in the fuel tank
Operating pressure	50 kPa (0.5 bar) (7.35 lb/in²)
Maximum output @12.3 volts	70 liters/hour (15.4 gallons/hour) (18.4 US gallons/hour)
Fuel pressure regulator:	
Type/location	In-line, within fuel tank
Operating pressure	50 kPa (0.5 bar) (7.25) lb/in²
Fuel filter	Remotely mounted on the inside of the longitudinal member - fitted with a renewable element and having a 84cc (3 fl-oz) water separation capacity
Fuel tank sender units	Two - both mounted remotely in the fuel tank, with only the rear serviceable.

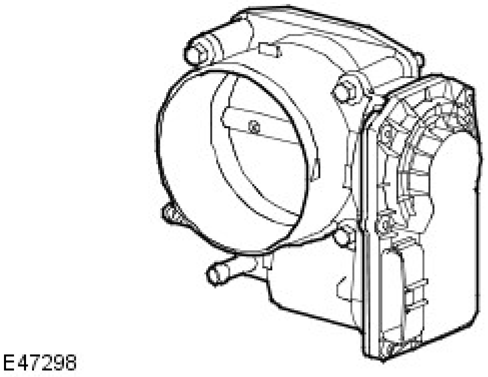
Acceleration Control - V8 S/C 4.2L Petrol - Acceleration Control

Description and Operation

Acceleration control for the 4.2 Liter supercharged petrol engine is achieved via an electronic throttle drive by wire system. The throttle is electronically connected to the engine control module (ECM). The ECM then controls the fuelling in accordance to signals recieved from the accelerator pedal position (APP) sensor.
For additional information, refer to: Electronic Engine Controls (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, Description and Operation).

ELECTRONIC THROTTLE

Electronic Throttle Body



The electronic throttle controls the air flow into the engine. In addition to the normal engine power control function, the electric throttle allows the speed control, idle speed control and engine speed limiting functions to be performed without the need for additional hardware.

The electronic throttle consists of a throttle body which incorporates a throttle plate driven by a direct current (DC) motor via reduction gears. A return spring biases the throttle plate in the closed direction.

Operation of the DC motor is controlled by the ECM, which outputs two pulse width modulation (PWM) signals to an H bridge drive circuit in the motor. The ECM varies the speed and direction of the motor by varying the duty cycle of the PWM signals.

To enable closed loop control, the position of the throttle plate is supplied to the ECM by two feedback Hall effect sensors in the throttle body. The feedback sensors have a common 5 volt supply and a common ground connection from the ECM. The sensors produce separate linear signal voltages to the ECM proportional to the position of the throttle plate. The ECM uses the signal from feedback sensor 1 as the primary signal of throttle plate position, and the signal from feedback sensor 2 for plausibility checks.

- The signal from feedback sensor 1 varies between 0.5 volt (0% throttle open) and 4.5 volts (100% throttle open)
- The signal from feedback sensor 2 varies between 4.5 volts (0% throttle open) and 0.5 volt (100% throttle open)

While the ignition is on, the ECM continuously monitors the two feedback sensors for short and open circuits. The ECM checks the feedback sensor signals, against each other and the inputs from the APP sensor, for plausibility. If a fault is detected in the feedback sensor signals or the DC motor, the ECM:

- Stores a related fault code in memory
- Illuminates the SERVICE ENGINE warning lamp in the instrument cluster
- Adopts a throttle limp home mode or disables throttle control, depending on the nature of the fault.

The throttle limp home mode adopted depends on the nature of the fault:

- If there is a fault with one feedback sensor, or the throttle position controller in the ECM, the ECM limits vehicle acceleration by limiting throttle plate opening.
- If there is a fault with both feedback sensors, the ECM uses fuel injection cut-off to limit engine speed to 1300 rev/min maximum.

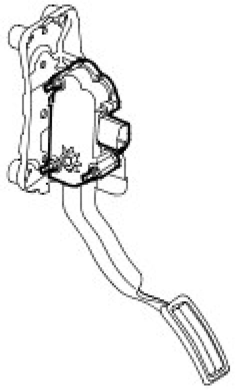
6	Throttle position 1	Input

ACCELERATOR PEDAL POSITION SENSOR



E46901

The APP is integral to the accelerator pedal assembly.

The APP sensor enables the ECM to determine the throttle position requested by the driver on the accelerator pedal.

The APP sensor is installed on the pedal box and consists of a twin track potentiometer with wipers driven by a linkage connected to the accelerator pedal. Each potentiometer track has a 5 volt supply and ground connection from the ECM, and produces a linear signal voltage to the ECM proportional to the position of the accelerator pedal. The signal voltage from track 1 of the potentiometer is approximately double that of the signal voltage from track 2.

From the sensor signals, the ECM determines driver demand as a percentage of pedal travel, where 0% is with the pedal released and 100% is with the pedal fully depressed. Driver demand is then used to calculate throttle angle, fuel quantity and ignition timing. The ECM also outputs driver demand on the controller area network (CAN) system, for use by the brake and gearbox control systems.

The ECM stores the signal values that correspond with closed and wide open throttle, and adapts to new values to accommodate component wear or replacement.

The signals from the APP sensor are monitored by the ECM for short and open circuits and plausibility. If a fault is detected, the ECM:

- Stores a related fault code in memory
- Illuminates the SERVICE ENGINE warning lamp in the instrument cluster
- Inhibits the driver demand message on the CAN bus, which disables the Hill Descent Control (HDC) function of the anti-lock brake system (ABS) control module and reduces the performance of the automatic gearbox (harsh gear changes and loss of kickdown).
- Adopts a throttle limp home mode.

The throttle limp home mode adopted depends on the nature of the fault:

- If a fault is detected with one potentiometer track, the ECM limits vehicle acceleration by limiting throttle plate opening.
- If a fault is detected with both potentiometer tracks, the ECM uses the throttle plate to run the engine at a fixed speed of 1472 rev/min while the brake pedal is released, and idle speed (750 rev/min) while the brake pedal is pressed or if there is a brake pedal sensor fault.
- If there is a process fault in the ECM, the ECM either uses fuel injection cut-off to limit engine speed to 1300 rev/ min or disables fuel injection to stop the engine.

Speed Control - V8 S/C 4.2L Petrol - Speed Control

Diagnosis and Testing

Overview

For information on the description and operation of the speed control systems, refer to section 310-03 - Speed Control in the workshop manual.

Inspection and verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
• Speed control sensor condition and installation • Speed control switches • Forward alert switch • Brake switches • Tire size and condition	• Fuses • Speed control sensor • Speed control switches • Forward alert switch • Brake switches • Adaptive speed control module • Engine control module (ECM) • ABS control module • Controller area network (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the DTC index.
    - Because the DTCs are stored in more than one module, a complete vehicle read is recommended
    - Make sure that all DTCs are cleared following rectification.

Forward looking sensor

The correct function of the system depends on the operation of the Forward Looking sensor, this requires correct alignment and an unobstructed field of view.

Customer complaints of poor system performance, late vehicle detection, late system braking, heavier than expected braking when gaining on the vehicle in front or system is detecting vehicles in adjacent lanes, may be due to the sensor pointing up or down (it should be set to level).

Check that there are no obstructions to the sensor

Check for signs of damage to the front bumper/sensor mounting area that could indicate that the sensor has been disturbed.

Check the sensor vertical alignment. For detailed instructions on sensor adjustment, refer to section 310-03 - Speed Control - Speed Control Sensor Adjustment in the workshop manual. If the sensor is adjusted up or down then carry out the diagnostic service alignment procedure using the approved diagnostic system.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Actions
C1A0041	Control module	• Cruise control module power supply circuit voltage out of range • General checksum failure (module internal failure)	A momentary low voltage occurred, check vehicle battery and charging circuit. Refer to the relevant section in the workshop manual. Refer to the electrical guides and check the power supply circuits to the module. Clear the DTC and retest. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Actions
C1A6511	Front Alert Switch Circuit	- Switch stuck - Switch circuit: short circuit to ground	Check the forward alert switch and circuits. Refer to the electrical guides.
C1A6515	Front Alert Switch Circuit	- Switch circuit: short circuit to power - Switch circuit: high resistance	Check the forward alert switch and circuits. Refer to the electrical guides.
C1A6611	Front Alert LED Circuit	- LED circuit: short circuit to ground	Check the forward alert LED and circuits. Refer to the electrical guides.
C1A6615	Front Alert LED Circuit	- LED circuit: short circuit to power - LED circuit: high resistance	Check the forward alert LED and circuits. Refer to the electrical guides.
C1A6754	Forward Looking Sensor	- Missing calibration	Calibrate the sensor using the approved diagnostic system.
C1A6787	Forward Looking Sensor	- Missing message	Check the speed control sensor and circuits. Refer to the electrical guides.
C1A6796	Forward Looking Sensor	- Component internal failure	Check the speed control sensor and circuits. Refer to the electrical guides.
C1A6797	Forward Looking Sensor	- Sensor obstructed or blocked	Check and clear any obstructions from the sensor, clear the DTC and retest.
C1A6798	Forward Looking Sensor	- Sensor over-temperature	Clear the DTC, allow vehicle to cool down and retest. Consider the atmospheric conditions before condemning a module.
P050429	Brake Switch A / B Correlation	- Brake switch malfunction - sub-processor	Check for ABS DTCs, check the brake switch and circuits (refer to the electrical guides). Clear the DTCs and test for normal operation.
P050464	Brake Switch A / B Correlation	- Brake switch malfunction	Check for ABS DTCs, check the brake switch and circuits (refer to the electrical guides). Clear the DTCs and test for normal operation.
P052500	Cruise Control Servo Control Circuit Range/Performance	- Internal control module corruption	Check the ECM and speed control modules and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
P057400	Cruise Control System - Vehicle Speed Too High	- Vehicle speed too high	Check for ABS DTCs. Refer to the relevant workshop manual section.
P057600	Cruise Control Input Circuit Low	- Speed control switch short circuit to ground - Speed control switch high resistance	Refer to the electrical guides and check the cruise control circuit between the ECM and switch. Check the switch operation and renew/renew as necessary.
P057700	Cruise Control Input Circuit High	- Speed control switch short circuit to power	Refer to the electrical guides and check the cruise control circuit between the ECM and switch. Check the switch operation and renew/renew as necessary.
U007388	Control Module Communication Bus "A" Off	- Bus off	The module setting this code has disabled CAN transmission. Ensure that the latest patch file is installed (available on GTR). Check for other bus off codes. Check the module and circuits. Refer to the electrical guides. Clear all DTCs and a road test the vehicle. If the concern reoccurs contact Dealer Technical Support for further advice. Under no circumstance should any parts be replaced to overcome this issue.
U010087	Lost Communication With ECM/PCM "A"	- CAN module status signals not received from the engine/powertrain control module (E/PCM) in the specified time	Refer to the lost communication statement at the start of the Network Communications section of the workshop manual.
U010187	Lost Communication with TCM	- CAN module status signals not received from the transmission control module TCM in the specified time	Refer to the Network Communications section of the workshop manual.

DTC	Description	Possible causes	Actions
U012287	Lost Communication With Vehicle Dynamics Control Module	● CAN module status signals not received from the VDM in the specified time	Refer to the Network Communications section of the workshop manual.
U015587	Lost Communication With Instrument Panel Cluster (IPC) Control Module	● CAN Link transfer case control module/instrument cluster missing message ● CAN bus fault ● IPC disconnected ● IPC not configured ● IPC failure ● Harness/connector issue	Check the control module installation/configuration. Refer to the lost communication statement at the start of the Network Communications section in the workshop manual.
U023500	Lost Communication With Cruise Control Front Distance Range Sensor	● Lost communication ● Fault status transmitted	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U030055	Internal Control Module Software Incompatibility	● Software incompatibility - Not configured	Configure the module using the approved diagnostic system.
U1A0088	Private Communication Network	● Bus off	The module setting this code has disabled CAN transmission. Ensure that the latest patch file is installed (available on GTR). Check for other bus off codes. Check the module and circuits. Refer to the electrical guides. Clear all DTCs and a road test the vehicle. If the concern reoccurs contact Dealer Technical Support for further advice. Under no circumstance should any parts be replaced to overcome this issue.
U1A1449	CAN Initialisation Failure	● Internal electronic failure	Check the power and ground circuits to the component. Refer to the electrical guides. Configure the module(s) using the approved diagnostic system. Clear the DTC and retest. If the problem persists, renew the control module. Refer to the warranty policy and procedures manual if a module is suspect.

Speed Control - V8 S/C 4.2L Petrol - Speed Control Sensor Adjustment

General Procedures

Special Tool(s)	
	Speed control aligner 310-148

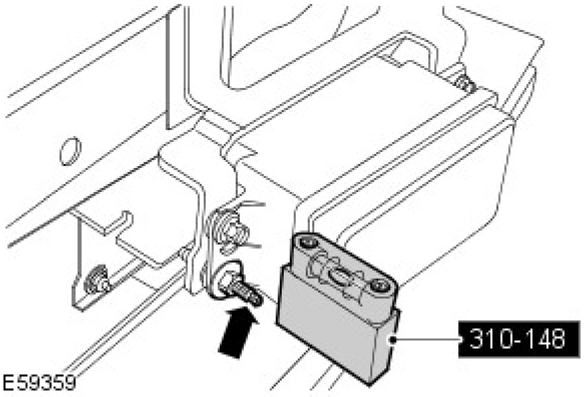
- NOTE: Special tool 310-148 is graduated in 0.5 degree increments.
- NOTE: This procedure details how to adjust the speed control sensor vertically. There is no horizontal adjustment required.

1. Remove the front bumper cover.
For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

2. ⚠ CAUTION: Drive the vehicle on to a flat, level surface.

Set the air suspension ride height to the STANDARD setting.

3. Using the special tool, check the speed sensor is level, (+/- 0.5 degree).



4. NOTE: The speed sensor has no mechanical horizontal adjustment.

- NOTE: Do not release the securing nut.

Using the special tool, set the speed control sensor.

- Rotate the vertical adjuster.

5. Install the front bumper cover.
For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

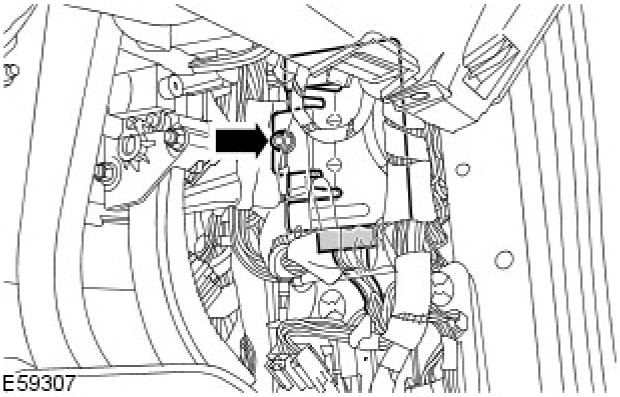
Published: 11-May-2011

Speed Control - V8 S/C 4.2L Petrol - Speed Control Module

Removal and Installation

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the Dynamic Response module.
   For additional information, refer to: Dynamic Response Module (204-06 Ride and Handling Optimization, Removal and Installation).
3. Remove the speed control module.
   - Loosen the bolt.
   - Release and disconnect the electrical connector.



Installation

1. Install the speed control module.
   - Connect and secure the electrical connector.
   - Tighten the bolt to 10 Nm (7 lb.ft).
2. Install the Dynamic Response module.
   For additional information, refer to: Dynamic Response Module (204-06 Ride and Handling Optimization, Removal and Installation).
3. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
4. Program a new control module using T4.

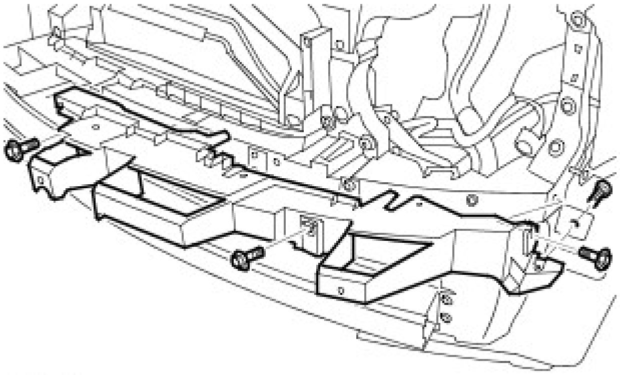
Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

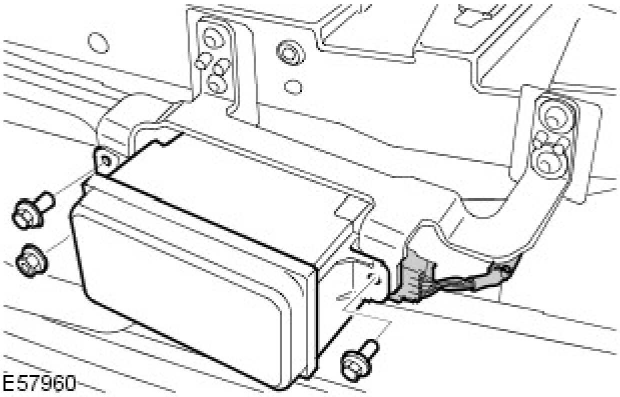
2. Remove the front bumper cover.
For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).



E57926

3. Remove the LH bumper support bracket.

- Remove the 3 Torx screws.
- Remove the screw.



E57960

4. Remove the speed control sensor.

- Remove the 2 bolts.
- Remove the nut.
- Release and disconnect the electrical connector.

Installation

1. Install the speed control sensor.

- Tighten the nuts and bolts to 10 Nm (7 lb.ft).
- Connect and secure the electrical connector.

2. Install the bumper support bracket.

- Tighten the screws.

3. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

4. Adjust the speed control sensor.
For additional information, refer to: Speed Control Sensor Adjustment (310-03C Speed Control - TDV6 2.7L Diesel, General Procedures).

5. Install the front bumper cover.

For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

6. Using T4, configure a new speed control sensor.

SPEED CONTROL

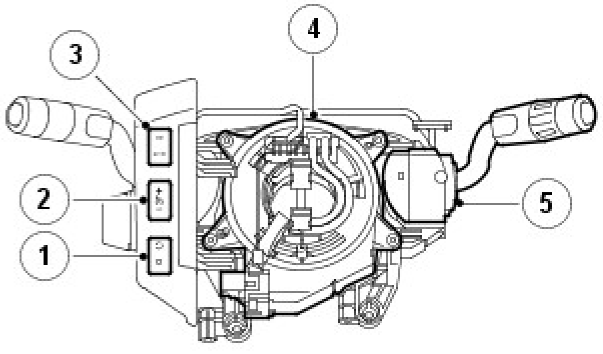
The speed control system is integrated with the engine management system and uses fueling intervention to automatically maintain a set vehicle speed. Once engaged, the system can also be used to accelerate the vehicle without using the accelerator pedal. The speed control system comprises the following components:

- Resume/Suspend switch
- '+' and '–' (set/accelerate and decelerate)
- Clock spring
- Speed control warning lamp (in the instrument cluster)

The speed control system also uses inputs from the brake pedal switch, the APP sensor, the ECM and the ABS Control Module.

The speed control is operated by the driver using only the steering wheel switches. When speed control is active, the ECM controls the electronic throttle to adjust the fuel supply as required to maintain the set speed.

CONTROL SWITCHES



E47030

Item	Part Number	Description
1	-	Suspend/Resume switch
2	-	Set speed/adjust speed (+/–) Switches
3	-	Adaptive speed control time gap adjustment switches
4	-	Clock spring
5	-	Wiper control column switch

The speed control switches are located on the left-hand (LH) side of the steering wheel. The switches are connected via fly leads directly to the clock spring. All of the speed control switches are non-latching momentary rocker switches. The minimum set speed for speed control is 18 mph (30 (km/h). Speed control is automatically suspended if the vehicle speed falls below 15 mph (24 km/h).

The speed control switches are resistive ladder type switches. There are three rocker switches associated with speed control, two of which are for adaptive speed control (where specified). The switches vary the resistance of a signal voltage sent to the ECM. The switches receive a 5 volt reference supply which is varied in response to which switches are pressed.

Suspend/Resume Switch

The suspend/resume switch controls the selection of speed control. When the ignition is in position II, a press of the suspend switch will activate the suspend mode which temporarily switches off the speed control system, but retains the previously set speed in the ECM memory.

Accelerate/Decelerate (+/–) Switches

When the speed control system is active, pressing the '+' switch set the controlled speed to the current road speed of the vehicle. Subsequent momentary presses of the switch increase the set road speed by 1 mph (2 km/h) with each press. If the switch is pressed and held the road speed will continue to increase until the switch is released. Momentarily pressing the '–' switch, decreases the set speed by 1 mph (2 km/h) with each press. If the switch is pressed and held, the set speed is decreased until the switch is released.

Time Gap Adjustment Switches

The time gap adjustment switches allows the driver to adjust the length of time gap between the vehicle and the vehicle in front. The maximum time gap is 2.4 seconds and the minimum time gap is 1 second.

ADAPTIVE SPEED CONTROL

General

The adaptive speed control system comprises the following components:

- Adaptive Speed Control Sensor
- Adaptive Speed Control module
- Steering wheel control switches
- ECM
- Electric throttle
- ABS module and pump

The adaptive speed control system uses a forward looking radar sensor to scan the road ahead, looking for objects that are moving at a different rate to itself. When a target is identified the adaptive speed control system will monitor the time gap between it and the target vehicle. When that gap falls below a set driver selected level (4 seconds) the adaptive speed control system will intervene slowing the vehicle by backing off the throttle and/ or applying the brakes, until the correct gap is attained.

The system will detect but not react to the following:

- Vehicles in the oncoming lane
- Stationary vehicles
- Pedestrians
- Vehicles not in the same lane.

Adaptive speed control is active when the vehicle is moving. Adaptive Speed Control only functions when a set speed is entered in normal speed control mode. The adaptive speed control system only intervenes with the set speed when it detects a target vehicle, and then only if the minimum time gap is breached.

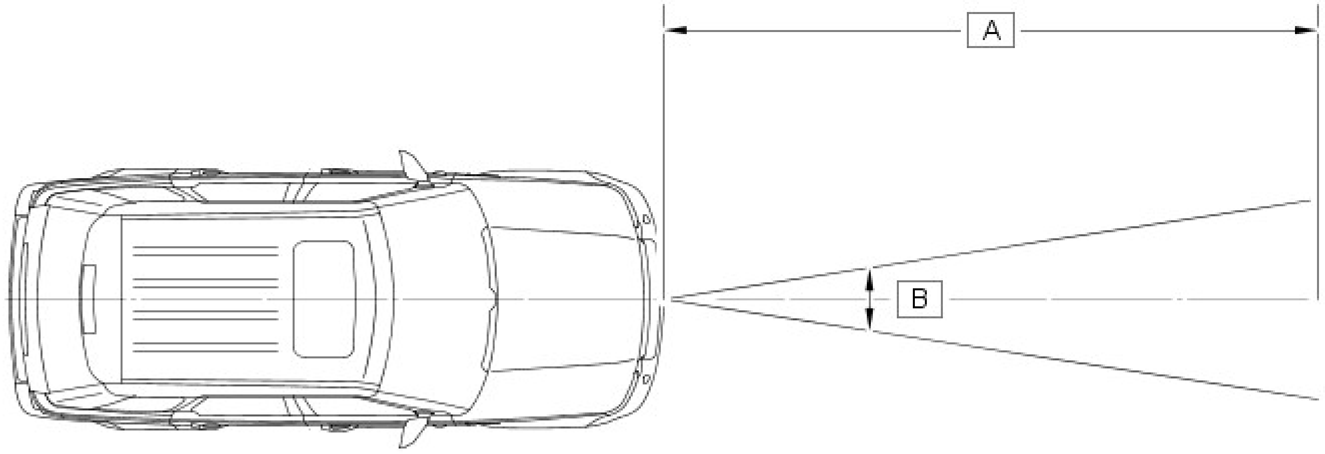
It is important to note that the system is intended for use in limited driving situations, does not remove control and responsibility from the driver, and at all times can be quickly overridden. The adaptive speed control system is not a collision warning system and will not react to stationary objects. The system does not operate below a minimum speed of approximately 30 km/h (20 mph) since it is unsuitable for use in cities or congested traffic. The system is best suited to main roads/ highways with gradual bends.

The ECM, throttle body and throttle control are unchanged from those used for non Adaptive Speed Control variants.

Radar Sensing

The adaptive speed control system is based on the use of a front mounted radar sensor. The sensor transmits a 1.5° wide beam forward of the vehicle and detects the returning signals reflected off other vehicles and objects ahead. The 1.5° wide radar beam is mechanically scanned at a rate of 10 sweeps/second across a total arc of 15° centered on the longitudinal axis of the vehicle. The radar operates at millimetric wavelengths (76 - 77 GHz) and transmits a frequency modulated continuous wave signal at a relatively low power level (no high power pulses).

Radar Viewing Angle/Range



E56519

Item	Part Number	Description
A	-	Sensor range 130 meters
B	-	Sensor scan angle 15 degrees

With the ignition switched ON, the adaptive speed control module is powered up but no radar transmissions are emitted until the vehicle is in motion.

The radar sensor detects three primary parameters of objects within the scanned arc. These are:

- Range
- Relative velocity
- Angle

- Range- the radar sensor detects the presence and ranges of different vehicles and objects within the scanned arc up to a distance of approximately 130 meters. The transmitted signal frequency changes continuously in a cyclic pattern (modulation). This means that, in the time taken for the signal wave front, to travel to and from a target vehicle (or other object), the transmission frequency will have changed. The difference between the received signal frequency and the new transmission frequency is proportional to the distance between the transmitting vehicle and the target vehicle.
- Relative speed - when the signal is reflected off a vehicle moving at a different speed (opening or closing gap) an effect known as the Doppler shift causes an extra frequency modulation to be imposed on the signal. This Doppler frequency varies with the relative speed of the vehicle being followed, enabling the system to differentiate between vehicles traveling at different speeds and also between moving vehicles and stationary objects.
- Angle of target - using a narrow angle beam to scan horizontally enables the system to distinguish between vehicles in different lanes and between vehicles and roadside objects.

Follow Mode

A set speed is selected in the normal speed control manner and this speed is maintained until a slower vehicle is encountered in the lane ahead. When the vehicle ahead comes within the effective range of the radar sensor, the system identifies it as a target vehicle and an icon is illuminated on the instrument cluster to indicate that the system is in "follow mode". When the distance between the two vehicles closes to a set time gap, the adaptive speed control system closes the throttle and if necessary applies the brakes to maintain the set time gap. Follow mode is effectively a closed loop system. If several vehicles are ahead, the closest vehicle is chosen as the target to follow. If the target vehicle moves out of radar range, or if either vehicle changes lane or drops below the minimum operating speed, the system exits follow mode and the follow mode icon is extinguished. The adaptive speed control system will only raise its speed to the originally set speed, it will not accelerate past this speed to maintain a time gap.

Driver operation of the foot brake or control switches will immediately cancel adaptive speed control.

System Restrictions

The adaptive speed control system is only intended to provide enhanced speed control as described above in certain restricted conditions. The following points should be noted:

Automatic braking is limited to approximately 20% of full pressure (0.2G) and is intended to provide a smooth, gradual deceleration in follow mode conditions. Harsh braking by the target vehicle or following the target vehicle down to very low speeds or to a halt will require driver override of the brakes.

While the radar sensor detects moving and stationary targets for assessment of the environment ahead, the system does not

react to or provide any control in situations other than follow mode conditions. Stationary or slow moving vehicles (below 10 km/h), pedestrians, objects on the road and oncoming vehicles in the same lane are not recognized.

WARNING: It must be emphasized that the adaptive speed control system is not a collision warning or avoidance system and that, other than the limited conditions of follow mode, driver intervention will be necessary to control the vehicle speed.

In follow mode, some situations may cause target ambiguities for the detection system. These situations include:

- The nearby presence of a third vehicle when driving on a line slightly offset to the target vehicle
- Vehicles edging into the lane ahead which are not detected by the system until they have moved into the radar beam.

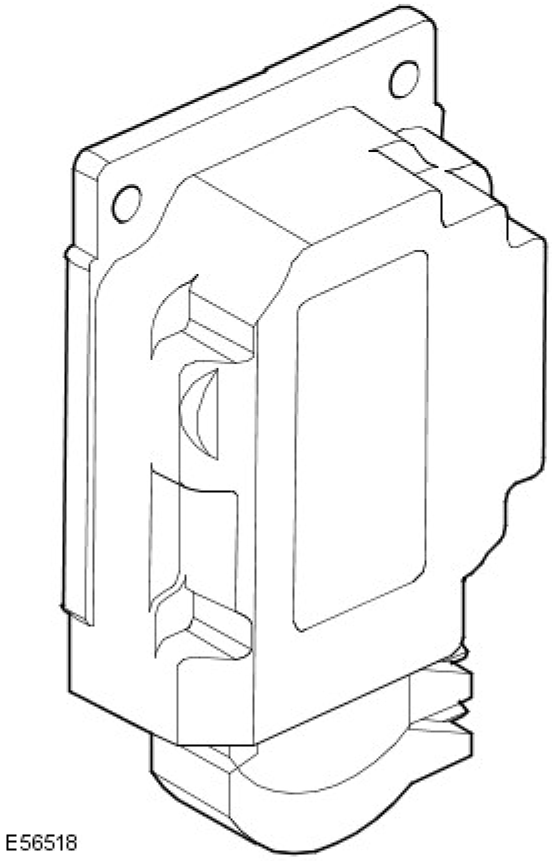
On the approach to, or exit from a bend, a target vehicle may be lost or a new target acquired as vehicles ahead change their angular position with respect to the radar sensor. On a straight road, if the sensing vehicle is in follow mode below its selected set speed, losing the target vehicle will cause the sensing vehicle to accelerate to this set speed. This acceleration is undesirable either on, or entering a bend when the target is suddenly lost, and in this situation the system inhibits the resumption of the set speed.

The speed control system compares vehicle speed data from the ABS system with the relative speed of an external object as detected by the radar sensor to ascertain whether the object is stationary or not.

• NOTE: If tires are fitted which are different in diameter from those specified for the vehicle, the vehicle speed calculated by the ABS will not be the true road speed. This situation may cause stationary objects to be falsely identified as moving vehicles and result in automatic deceleration on a clear road.

COMPONENTS

Adaptive Speed Control Module



The Adaptive Speed Control module, located on the drivers side at the bottom of the A post. The control module is connected to The other vehicle systems via The high speed CAN bus. Signals from The Adaptive Speed Control forward looking radar sensor are received on a dedicated CAN bus between The two modules.

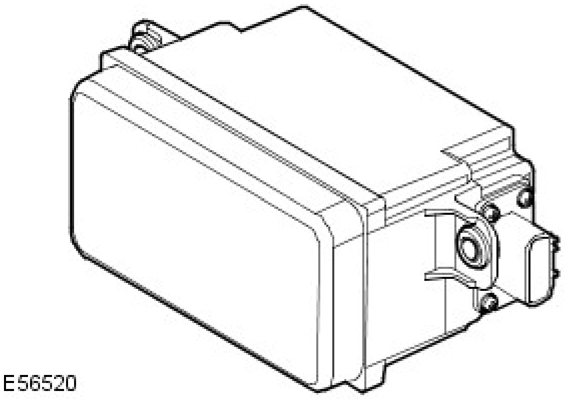
Adaptive Speed Control Sensor



Adaptive Speed Control Sensor Harness Connector C2025

Pin No	Description	Input/Output
1	Ignition	Input
2	GND	-
3	CAN -	Input/Output
4	CAN+	Input/Output
5	B+	Input

The adaptive speed control radar sensor is located in the front bumper, on the LH side adjacent to the front fog light (where fitted) behind the bumper cover. The sensor is connected to the Adaptive Speed Control, module via a private CAN bus. If the unit is replaced in service the unit must be re-aligned verticallyFor additional information, refer to: Speed Control Sensor (310-03C Speed Control - TDV6 2.7L Diesel, Removal and Installation).
For additional information, refer to: Speed Control Sensor Adjustment (310-03C Speed Control - TDV6 2.7L Diesel, General Procedures).
.

Horizontal alignment is achieved by putting the sensor in service mode via T4. The vehicle is then driven for a short period while the sensor calibrates itself. Calibration is complete when the 'follow' icon in the instrument cluster stops flashing.

Forward Alert

The forward alert system utilizes the Adaptive Speed Control system components. Forward alert is turned on and off independently of Adaptive Speed Control, via a switch mounted in the instrument panel above the Integrated Head Unit. Forward alert will notify the driver by means of a chime, and icon in the instrument cluster and indication in the message center, when a target vehicle comes into range. The system will **NOT** use throttle or brake intervention to slow the vehicle.

- NOTE: This system is intended as a driver aid and should be used as such. The system is not a collision warning or avoidance device.

Speed Control - V8 4.4L Petrol - Speed Control

Diagnosis and Testing

Overview

For information on the description and operation of the speed control systems, refer to section 310-03 - Speed Control in the workshop manual.

Inspection and verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
• Forward looking sensor condition and installation • Speed control switches • Forward alert switch • Brake switches • Tire size and condition	• Fuses • Forward looking sensor • Speed control switches • Forward alert switch • Brake switches • Adaptive speed control module • Engine control module (ECM) • ABS control module • Controller area network (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the DTC index.
    - Because the DTCs are stored in more than one module, a complete vehicle read is recommended
    - Make sure that all DTCs are cleared following rectification.

Forward looking sensor

The correct function of the system depends on the operation of the Forward Looking sensor, this requires correct alignment and an unobstructed field of view.

Customer complaints of poor system performance, late vehicle detection, late system braking, heavier than expected braking when gaining on the vehicle in front or system is detecting vehicles in adjacent lanes, may be due to the sensor pointing up or down (it should be set to level).

Check that there are no obstructions to the sensor

Check for signs of damage to the front bumper/sensor mounting area that could indicate that the sensor has been disturbed.

Check the sensor vertical alignment. For detailed instructions on sensor adjustment, refer to section 310-03 - Speed Control - Speed Control Sensor Adjustment in the workshop manual. If the sensor is adjusted up or down then carry out the diagnostic service alignment procedure using the approved diagnostic system.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Actions
C1A0041	Control Module	• Cruise control module power supply circuit voltage out of range • General checksum failure (module internal failure)	A momentary low voltage occurred, check vehicle battery and charging circuit. Refer to the relevant section in the workshop manual. Refer to the electrical guides and check the power supply circuits to the module. Clear the DTC and retest. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Actions
C1A6511	Front Alert Switch Circuit	● Switch stuck ● Switch circuit: short circuit to ground	Check the forward alert switch and circuits. Refer to the electrical guides.
C1A6515	Front Alert Switch Circuit	● Switch circuit: short circuit to power ● Switch circuit: high resistance	Check the forward alert switch and circuits. Refer to the electrical guides.

P057700	Cruise Control Input Circuit High	● Speed control switch short circuit to power	Refer to the electrical guides and check the cruise control circuit between the ECM and switch. Check the switch operation and renew/renew as necessary.
U007388	Control Module Communication Bus "A" Off	● Bus off	The module setting this code has disabled CAN transmission. Ensure that the latest patch file is installed (available on GTR). Check for other bus off codes. Check the module and circuits. Refer to the electrical guides. Clear all DTCs and a road test the vehicle. If the concern reoccurs contact Dealer Technical Support for further advice. Under no circumstance should any parts be replaced to overcome this issue.
U010087	Lost Communication With ECM/PCM "A"	● CAN module status signals not received from the engine/powertrain control module (E/PCM) in the specified time	Refer to the lost communication statement at the start of the Network Communications section of the workshop manual.
U010187	Lost Communication with TCM	● CAN module status signals not received from the transmission control module TCM in the specified time	Refer to the Network Communications section of the workshop manual.

DTC	Description	Possible causes	Actions
U012287	Lost Communication With Vehicle Dynamics Control Module	● CAN module status signals not received from the VDM in the specified time	Refer to the Network Communications section of the workshop manual.
U015587	Lost Communication With Instrument Panel Cluster (IPC) Control Module	● CAN Link transfer case control module/instrument cluster missing message ● CAN bus fault ● IPC disconnected ● IPC not configured ● IPC failure ● Harness/connector issue	Check the control module installation/configuration. Refer to the lost communication statement at the start of the Network Communications section in the workshop manual.
U023500	Lost Communication With Cruise Control Front Distance Range Sensor	● Lost communication ● Fault status transmitted	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U030055	Internal Control Module Software Incompatibility	● Software incompatibility - Not configured	Configure the module using the approved diagnostic system.
U1A0088	Private Communication Network	● Bus off	The module setting this code has disabled CAN transmission. Ensure that the latest patch file is installed (available on GTR). Check for other bus off codes. Check the module and circuits. Refer to the electrical guides. Clear all DTCs and a road test the vehicle. If the concern reoccurs contact Dealer Technical Support for further advice. Under no circumstance should any parts be replaced to overcome this issue.
U1A1449	CAN Initialisation Failure	● Internal electronic failure	Check the power and ground circuits to the component. Refer to the electrical guides. Configure the module(s) using the approved diagnostic system. Clear the DTC and retest. If the problem persists, renew the control module. Refer to the warranty policy and procedures manual if a module is suspect.

Speed Control - V8 4.4L Petrol - Speed Control Sensor Adjustment

General Procedures

Special Tool(s)	
310-148 E59358	Speed control aligner 310-148

- NOTE: Special tool 310-148 is graduated in 0.5 degree increments.

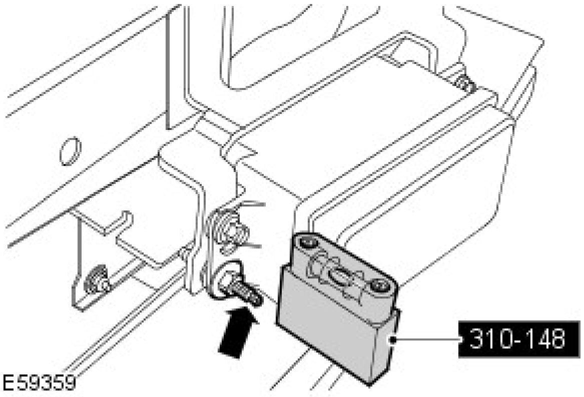
- NOTE: This procedure details how to adjust the speed control sensor vertically. There is no horizontal adjustment required.

1. Remove the front bumper cover.
For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

2. ⚠ CAUTION: Drive the vehicle on to a flat, level surface.

Set the air suspension ride height to the STANDARD setting.

3. Using the special tool, check the speed sensor is level, (+/- 0.5 degree).



4. NOTE: The speed sensor has no mechanical horizontal adjustment.

- NOTE: Do not release the securing nut.

Using the special tool, set the speed control sensor.

- Rotate the vertical adjuster.

5. Install the front bumper cover.
For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

Published: 11-May-2011

Speed Control - V8 4.4L Petrol - Speed Control Module

Removal and Installation

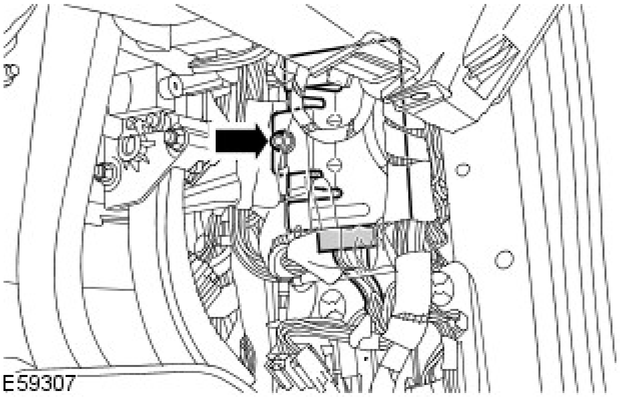
Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the Dynamic Response module.
For additional information, refer to: Dynamic Response Module (204-06 Ride and Handling Optimization, Removal and Installation).

3. Remove the speed control module.

- Loosen the bolt.
- Release and disconnect the electrical connector.



Installation

1. Install the speed control module.

- Connect and secure the electrical connector.
- Tighten the bolt to 10 Nm (7 lb.ft).

2. Install the Dynamic Response module.
For additional information, refer to: Dynamic Response Module (204-06 Ride and Handling Optimization, Removal and Installation).

3. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

4. Program a new control module using T4.

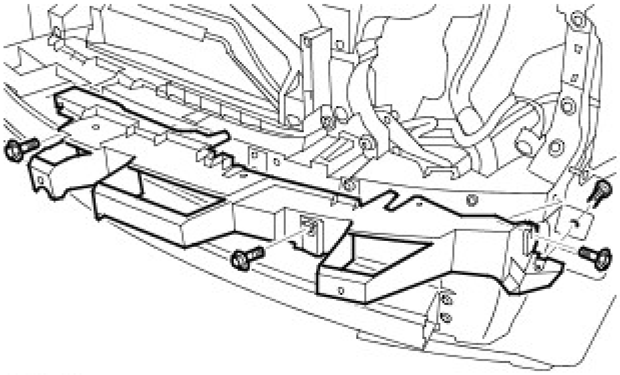
Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

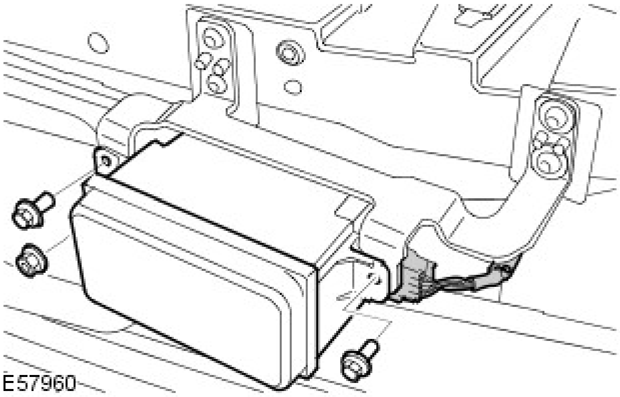
2. Remove the front bumper cover.
For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).



E57926

3. Remove the LH bumper support bracket.

- Remove the 3 Torx screws.
- Remove the screw.



E57960

4. Remove the speed control sensor.

- Remove the 2 bolts.
- Remove the nut.
- Release and disconnect the electrical connector.

Installation

1. Install the speed control sensor.

- Tighten the nuts and bolts to 10 Nm (7 lb.ft).
- Connect and secure the electrical connector.

2. Install the bumper support bracket.

- Tighten the screws.

3. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

4. Adjust the speed control sensor.
For additional information, refer to: Speed Control Sensor Adjustment (310-03C Speed Control - TDV6 2.7L Diesel, General Procedures).

5. Install the front bumper cover.

For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

6. Using T4, configure a new speed control sensor.

12	-	Adaptive speed control radar sensor
13	-	Adaptive speed control module
14	-	ABS module

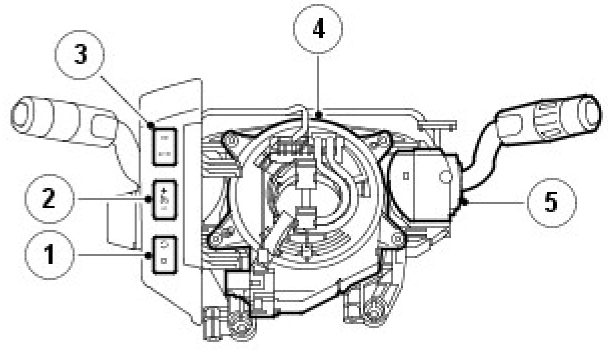
The speed control system is integrated with the engine management system and uses fueling intervention to automatically maintain a set vehicle speed. Once engaged, the system can also be used to accelerate the vehicle without using the accelerator pedal. The speed control system comprises the following components:

- On/Off/Suspend switch
- '+' and '–' (set/accelerate and decelerate)
- Resume switch
- Clock spring
- Speed control warning lamp (in the instrument cluster)

The speed control system also uses inputs from the brake pedal switch, the APP sensor, the ECM and the ABS Control Module.

The speed control is operated by the driver using only the steering wheel switches. When speed is active, the ECM regulates the pulse width modulation (PWM) signals to the fuel injectors to adjust the fuel supply as required to maintain the set speed.

CONTROL SWITCHES



E47030

Item	Part Number	Description
1	-	Suspend/Resume switch
2	-	Accelerate/Decelerate (+/–) Switches
3	-	Adaptive speed control time gap switches
4	-	Clock spring
5	-	Wiper control column switch

The speed control switches are located on the left-hand (LH) side of the steering wheel. The switches are connected via fly leads directly to the clock spring. All the speed control switches are non-latching momentary rocker switches. The minimum set speed is 18 mph (30 (km/h). Speed control is automatically suspended if the vehicle speed falls below 15 mph (24 km/h).

The speed control switches are resistive ladder type switches. There are three rocker switches associated with speed control, two of which are for adaptive speed control (where specified). The switches vary the resistance of a signal voltage sent to the ECM. The switches receive a 5 volt reference supply. The ECM measures the returned voltage to determine which switch has been pressed.

Suspend/Resume Switch

The suspend/resume switch controls the selection of speed control. When the ignition is in position II, a single press of the suspend switch will activate the suspend mode. This temporarily switches off the speed control system, but retains the previously set speed in the ECM memory.

Resume Switch

A second press of the switch re-activates the previously set speed after the speed control has been suspended by pressing the suspend switch or by depressing the brake pedal.

Accelerate / Decelerate (+ / –) Switches

When the speed control system is active, pressing the '+' switch sets the controlled speed to the current road speed of the vehicle. Subsequent momentary presses of the switch increases the set road speed by 0.6 mph (1 km/h). If the switch is pressed and held the road speed will continue to increase until the switch is released. Momentarily pressing the '–' switch, decreases the set speed by 0.6 mph (1 km/h). If the switch is pressed and held, the set speed is decreased until the switch is released

Time Gap Adjustment Switches

The time gap adjustment switches allows the driver to adjust the length of time gap between the vehicle and the vehicle in front. The maximum time gap is 2.4 seconds and the minimum time gap is 1 second.

ADAPTIVE SPEED CONTROL

General

The adaptive speed control system comprises the following components:

- Adaptive Speed Control Sensor
- Adaptive Speed Control module
- Steering wheel control switches
- ECM
- Electric throttle
- ABS module and pump

The adaptive speed control system uses a forward looking radar sensor to scan the road ahead, looking for objects that are moving at a different rate to itself. When a target is identified the adaptive speed control system will monitor the time gap between it and the target vehicle. When that gap falls below a set driver selected level (4 seconds) the adaptive speed control system will intervene slowing the vehicle by backing off the throttle and/ or applying the brakes, until the correct gap is attained.

The system will detect but not react to the following:

- Vehicles in the oncoming lane
- Stationary vehicles
- Pedestrians
- Vehicles not in the same lane.

Adaptive speed control is active when the vehicle is moving. Adaptive Speed Control only functions when a set speed is entered in normal speed control mode. The adaptive speed control system only intervenes with the set speed when it detects a target vehicle, and then only if the minimum time gap is breached.

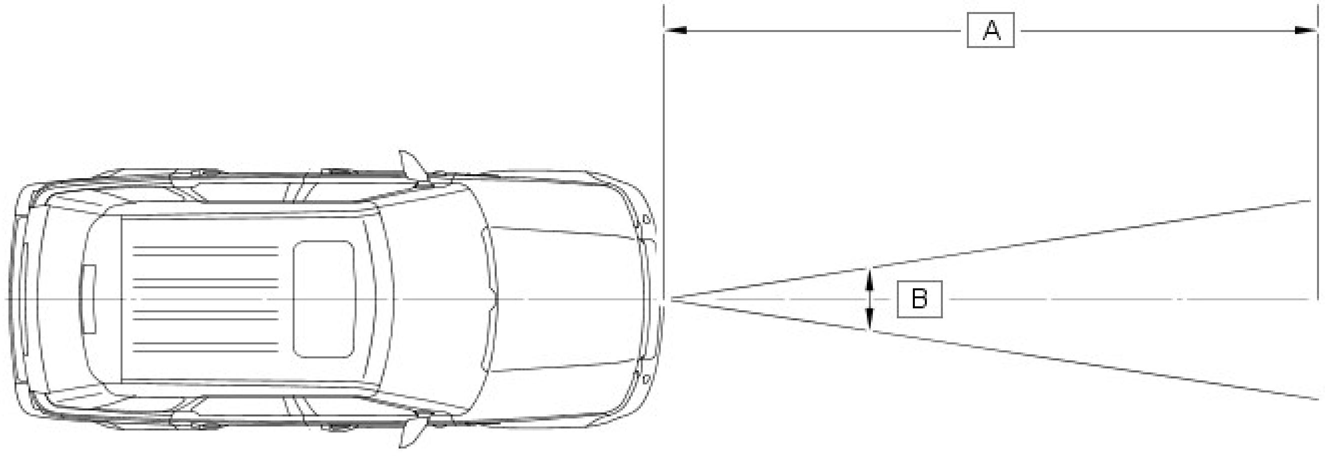
It is important to note that the system is intended for use in limited driving situations, does not remove control and responsibility from the driver, and at all times can be quickly overridden. The adaptive speed control system is not a collision warning system and will not react to stationary objects. The system does not operate below a minimum speed of approximately 30 km/h (20 mph) since it is unsuitable for use in cities or congested traffic. The system is best suited to main roads/ highways with gradual bends.

The ECM, throttle body and throttle control are unchanged from those used for non Adaptive Speed Control variants.

Radar Sensing

The adaptive speed control system is based on the use of a front mounted radar sensor. The sensor transmits a 1.5° wide beam forward of the vehicle and detects the returning signals reflected off other vehicles and objects ahead. The 1.5° wide radar beam is mechanically scanned at a rate of 10 sweeps/second across a total arc of 15° centered on the longitudinal axis of the vehicle. The radar operates at millimetric wavelengths (76 - 77 GHz) and transmits a frequency modulated continuous wave signal at a relatively low power level (no high power pulses).

Radar Viewing Angle/Range



E56519

Item	Part Number	Description
A	-	Sensor range 130 meters
B	-	Sensor scan angle 15 degrees

With the ignition switched ON, the adaptive speed control module is powered up but no radar transmissions are emitted until the vehicle is in motion.

The radar sensor detects three primary parameters of objects within the scanned arc. These are:

- Range
- Relative velocity
- Angle

- Range- the radar sensor detects the presence and ranges of different vehicles and objects within the scanned arc up to a distance of approximately 130 meters. The transmitted signal frequency changes continuously in a cyclic pattern (modulation). This means that, in the time taken for the signal wave front, to travel to and from a target vehicle (or other object), the transmission frequency will have changed. The difference between the received signal frequency and the new transmission frequency is proportional to the distance between the transmitting vehicle and the target vehicle.
- Relative speed - when the signal is reflected off a vehicle moving at a different speed (opening or closing gap) an effect known as the Doppler shift causes an extra frequency modulation to be imposed on the signal. This Doppler frequency varies with the relative speed of the vehicle being followed, enabling the system to differentiate between vehicles traveling at different speeds and also between moving vehicles and stationary objects.
- Angle of target - using a narrow angle beam to scan horizontally enables the system to distinguish between vehicles in different lanes and between vehicles and roadside objects.

Follow Mode

A set speed is selected in the normal speed control manner and this speed is maintained until a slower vehicle is encountered in the lane ahead. When the vehicle ahead comes within the effective range of the radar sensor, the system identifies it as a target vehicle and an icon is illuminated on the instrument cluster to indicate that the system is in "follow mode". When the distance between the two vehicles closes to a set time gap, the adaptive speed control system closes the throttle and if necessary applies the brakes to maintain the set time gap. Follow mode is effectively a closed loop system. If several vehicles are ahead, the closest vehicle is chosen as the target to follow. If the target vehicle moves out of radar range, or if either vehicle changes lane or drops below the minimum operating speed, the system exits follow mode and the follow mode icon is extinguished. The adaptive speed control system will only raise its speed to the originally set speed, it will not accelerate past this speed to maintain a time gap.

Driver operation of the foot brake or control switches will immediately cancel adaptive speed control.

System Restrictions

The adaptive speed control system is only intended to provide enhanced speed control as described above in certain restricted conditions. The following points should be noted:

Automatic braking is limited to approximately 20% of full pressure (0.2G) and is intended to provide a smooth, gradual deceleration in follow mode conditions. Harsh braking by the target vehicle or following the target vehicle down to very low speeds or to a halt will require driver override of the brakes.

While the radar sensor detects moving and stationary targets for assessment of the environment ahead, the system does not

react to or provide any control in situations other than follow mode conditions. Stationary or slow moving vehicles (below 10 km/h), pedestrians, objects on the road and oncoming vehicles in the same lane are not recognized.

⚠ WARNING: It must be emphasized that the adaptive speed control system is not a collision warning or avoidance system and that, other than the limited conditions of follow mode, driver intervention will be necessary to control the vehicle speed.

In follow mode, some situations may cause target ambiguities for the detection system. These situations include:

- The nearby presence of a third vehicle when driving on a line slightly offset to the target vehicle
- Vehicles edging into the lane ahead which are not detected by the system until they have moved into the radar beam.

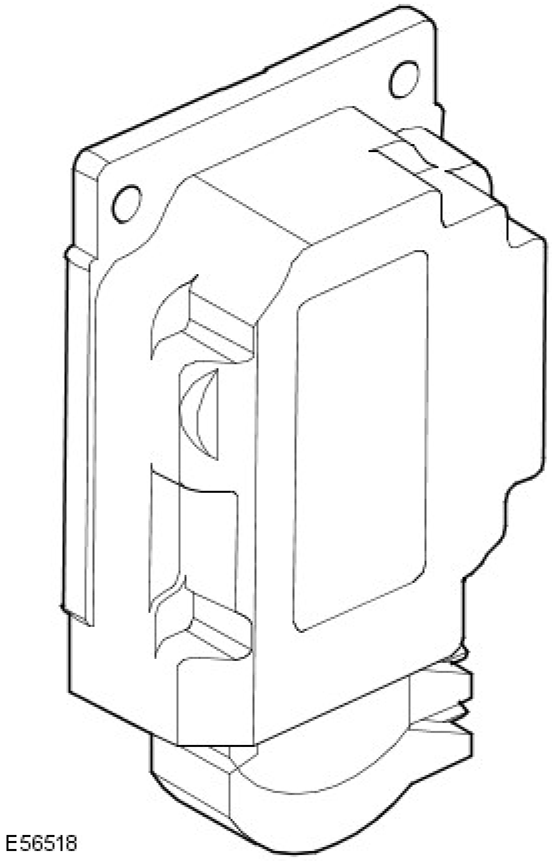
On the approach to, or exit from a bend, a target vehicle may be lost or a new target acquired as vehicles ahead change their angular position with respect to the radar sensor. On a straight road, if the sensing vehicle is in follow mode below its selected set speed, losing the target vehicle will cause the sensing vehicle to accelerate to this set speed. This acceleration is undesirable either on, or entering a bend when the target is suddenly lost, and in this situation the system inhibits the resumption of the set speed.

The speed control system compares vehicle speed data from the ABS system with the relative speed of an external object as detected by the radar sensor to ascertain whether the object is stationary or not.

• NOTE: If tires are fitted which are different in diameter from those specified for the vehicle, the vehicle speed calculated by the ABS will not be the true road speed. This situation may cause stationary objects to be falsely identified as moving vehicles and result in automatic deceleration on a clear road.

COMPONENTS

Adaptive Speed Control Module



E56518

The Adaptive Speed Control module, located on the drivers side at the bottom of the A post. The control module is connected to The other vehicle systems via The high speed controller area network (CAN) bus. Signals from The Adaptive Speed Control forward looking radar sensor are received on a dedicated CAN bus between The two modules.

Adaptive Speed Control Sensor Harness Connector C2025

Pin No	Description	Input/Output
1	Ignition	Input
2	GND	-
3	CAN -	Input/Output
4	CAN+	Input/Output
5	B+	Input

The adaptive speed control radar sensor is located in the front bumper, on the LH side adjacent to the front fog light (where fitted) behind the bumper cover. The sensor is connected to the Adaptive Speed Control, module via a private CAN bus. If the unit is replaced in service the unit must be re-aligned verticallyFor additional information, refer to: Speed Control Sensor (310-03C Speed Control - TDV6 2.7L Diesel, Removal and Installation).
For additional information, refer to: Speed Control Sensor Adjustment (310-03C Speed Control - TDV6 2.7L Diesel, General Procedures).
.

Horizontal alignment is achieved by putting the sensor in service mode via T4. The vehicle is then driven for a short period while the sensor calibrates itself. Calibration is complete when the 'follow' icon in the instrument cluster stops flashing.

Forward Alert

The forward alert system utilizes the Adaptive Speed Control system components. Forward alert is turned on and off independently of Adaptive Speed Control, via a switch mounted in the instrument panel above the Integrated Head Unit. Forward alert will notify the driver by means of a chime, and icon in the instrument cluster and indication in the message center, when a target vehicle comes into range. The system will **NOT** use throttle or brake intervention to slow the vehicle.

- NOTE: This system is intended as a driver aid and should be used as such. The system is not a collision warning or avoidance device.

Speed Control - TDV6 2.7L Diesel - Speed Control

Diagnosis and Testing

Overview

For information on the description and operation of the speed control systems, refer to section 310-03 - Speed Control in the workshop manual.

Inspection and verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
- Forward looking sensor condition and installation - Speed control switches - Forward alert switch - Brake switches - Tire size and condition	- Fuses - Forward looking sensor - Speed control switches - Forward alert switch - Brake switches - Adaptive speed control module - Engine control module (ECM) - ABS control module - Controller area network (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the DTC index.
   - Because the DTCs are stored in more than one module, a complete vehicle read is recommended
   - Make sure that all DTCs are cleared following rectification.

Forward looking sensor

The correct function of the system depends on the operation of the Forward Looking sensor, this requires correct alignment and an unobstructed field of view.

Customer complaints of poor system performance, late vehicle detection, late system braking, heavier than expected braking when gaining on the vehicle in front or system is detecting vehicles in adjacent lanes, may be due to the sensor pointing up or down (it should be set to level).

Check that there are no obstructions to the sensor

Check for signs of damage to the front bumper/sensor mounting area that could indicate that the sensor has been disturbed.

Check the sensor vertical alignment. For detailed instructions on sensor adjustment, refer to section 310-03 - Speed Control - Speed Control Sensor Adjustment in the workshop manual. If the sensor is adjusted up or down then carry out the diagnostic service alignment procedure using the approved diagnostic system.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Actions
C1A0041	Control Module	- Cruise control module power supply circuit voltage out of range - General checksum failure (module internal failure)	A momentary low voltage occurred, check vehicle battery and charging circuit. Refer to the relevant section in the workshop manual. Refer to the electrical guides and check the power supply circuits to the module. Clear the DTC and retest. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Actions
C1A6511	Front Alert Switch Circuit	● Switch stuck ● Switch circuit: short circuit to ground	Check the forward alert switch and circuits. Refer to the electrical guides.
C1A6515	Front Alert Switch Circuit	● Switch circuit: short circuit to power ● Switch circuit: high resistance	Check the forward alert switch and circuits. Refer to the electrical guides.
C1A6611	Front Alert LED Circuit	● LED circuit: short circuit to ground	Check the forward alert LED and circuits. Refer to the electrical guides.
C1A6615	Front Alert LED Circuit	● LED circuit: short circuit to power ● LED circuit: high resistance	Check the forward alert LED and circuits. Refer to the electrical guides.
C1A6754	Forward Looking Sensor	● Missing calibration	Calibrate the sensor using the approved diagnostic system.
C1A6787	Forward Looking Sensor	● Missing message	Check the forward looking sensor and circuits. Refer to the electrical guides.
C1A6796	Forward Looking Sensor	● Component internal failure	Check the forward looking sensor and circuits. Refer to the electrical guides.
C1A6797	Forward Looking Sensor	● Sensor obstructed or blocked	Check and clear any obstructions from the sensor, clear the DTC and retest.
C1A6798	Forward Looking Sensor	● Sensor over-temperature	Clear the DTC, allow vehicle to cool down and retest. Consider the atmospheric conditions before condemning a module.
P050400	Brake Switch A / B Correlation	● The brake pressure reading does not agree with the brake lamp switch value ● Brake switch failure ● ECM failure	Check the brake switch and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
P057100	Brake Switch A Circuit	● The brake pressure reading does not agree with the brake lamp switch value ● Brake switch failure ● ECM failure	Check the brake switch and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
P229900	Brake Pedal Position/Accelerator Pedal Position Incompatible	Event information (this code indicates unexpected simultaneous operation of the accelerator and brake pedals) ● Brake lamp switch fault ● Accelerator pedal position (APP) sensor fault ● APP sensor circuits short circuit to ground ● APP sensor circuits short circuit to power ● APP sensor circuits high resistance ● Brake lamp switch circuits short circuit to ground ● Brake lamp switch circuits short circuit to power ● Brake lamp switch	Check the brake lamp function. If the brake lights function correctly, check the APP sensor using a datalogger function. Check both APP sensor tracks with the pedal in the rest position. Recheck the values with the pedal in the wide-open position. Both tracks should range between 0% at idle to 99% at wide open throttle. If the values are correct, check the APP sensor and brake lamp switch circuits. Refer to the electrical guides. Also note that the driver may have been left-foot-braking. If the values are incorrect, install a new pedal. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Actions
		circuits high resistance	
U007388	Control Module Communication Bus "A" Off	● Bus off	The module setting this code has disabled CAN transmission. Ensure that the latest patch file is installed (available on GTR). Check for other bus off codes. Check the module and circuits. Refer to the electrical guides. Clear all DTCs and a road test the vehicle. If the concern reoccurs contact Dealer Technical Support for further advice. Under no circumstance should any parts be replaced to overcome this issue.
U010087	Lost Communication With ECM/PCM "A"	● CAN module status signals not received from the engine/powertrain control module (E/PCM) in the specified time	Refer to the lost communication statement at the start of the Network Communications section of the workshop manual.
U010187	Lost Communication with TCM	● CAN module status signals not received from the transmission control module TCM in the specified time	Refer to the Network Communications section of the workshop manual.
U012287	Lost Communication With Vehicle Dynamics Control Module	● CAN module status signals not received from the VDM in the specified time	Refer to the Network Communications section of the workshop manual.
U015587	Lost Communication With Instrument Panel Cluster (IPC) Control Module	● CAN Link transfer case control module/instrument cluster missing message ● CAN bus fault ● IPC disconnected ● IPC not configured ● IPC failure ● Harness/connector issue	Check the control module installation/configuration. Refer to the lost communication statement at the start of the Network Communications section in the workshop manual.
U023500	Lost Communication With Cruise Control Front Distance Range Sensor	● Lost communication ● Fault status transmitted	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U030055	Internal Control Module Software Incompatibility	● Software incompatibility - Not configured	Configure the module using the approved diagnostic system.
U1A0088	Private Communication Network	● Bus off	The module setting this code has disabled CAN transmission. Ensure that the latest patch file is installed (available on GTR). Check for other bus off codes. Check the module and circuits. Refer to the electrical guides. Clear all DTCs and a road test the vehicle. If the concern reoccurs contact Dealer Technical Support for further advice. Under no circumstance should any parts be replaced to overcome this issue.
U1A1449	CAN Initialization Failure	● Internal electronic failure	Check the power and ground circuits to the component. Refer to the electrical guides. Configure the module(s) using the approved diagnostic system. Clear the DTC and retest. If the problem persists, renew the control module. Refer to the warranty policy and procedures manual if a module is suspect.

Speed Control - TDV6 2.7L Diesel - Speed Control Sensor Adjustment

General Procedures

Special Tool(s)	
	Speed control aligner 310-148

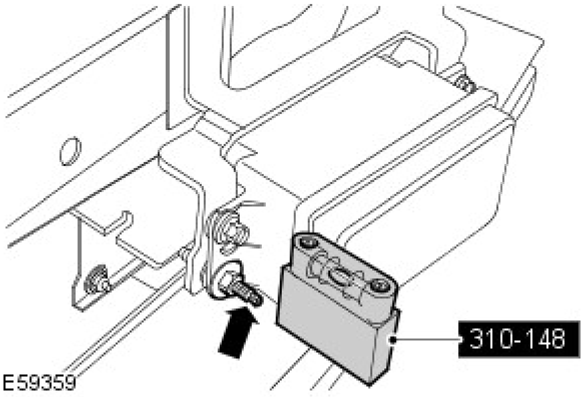
- NOTE: Special tool 310-148 is graduated in 0.5 degree increments.
- NOTE: This procedure details how to adjust the speed control sensor vertically. There is no horizontal adjustment required.

1. Remove the front bumper cover.
For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

2. ⚠ CAUTION: Drive the vehicle on to a flat, level surface.

Set the air suspension ride height to the STANDARD setting.

3. Using the special tool, check the speed sensor is level, (+/- 0.5 degree).



4. NOTE: The speed sensor has no mechanical horizontal adjustment.

- NOTE: Do not release the securing nut.

Using the special tool, set the speed control sensor.

- Rotate the vertical adjuster.

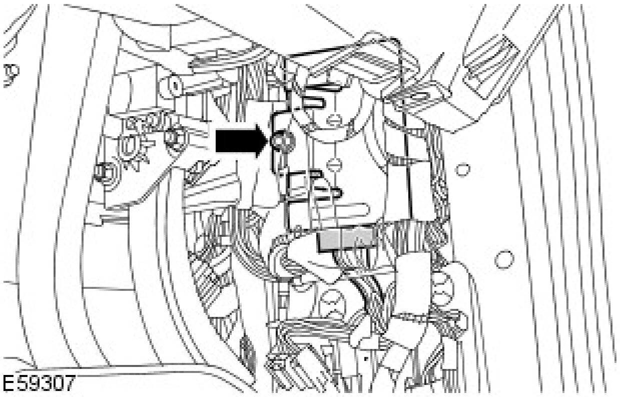
5. Install the front bumper cover.
For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

Speed Control - TDV6 2.7L Diesel - Speed Control Module

Removal and Installation

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the Dynamic Response module.
   For additional information, refer to: Dynamic Response Module (204-06 Ride and Handling Optimization, Removal and Installation).
3. Remove the speed control module.
   - Loosen the bolt.
   - Release and disconnect the electrical connector.



Installation

1. Install the speed control module.
   - Connect and secure the electrical connector.
   - Tighten the bolt to 10 Nm (7 lb.ft).
2. Install the Dynamic Response module.
   For additional information, refer to: Dynamic Response Module (204-06 Ride and Handling Optimization, Removal and Installation).
3. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
4. Program a new control module using T4.

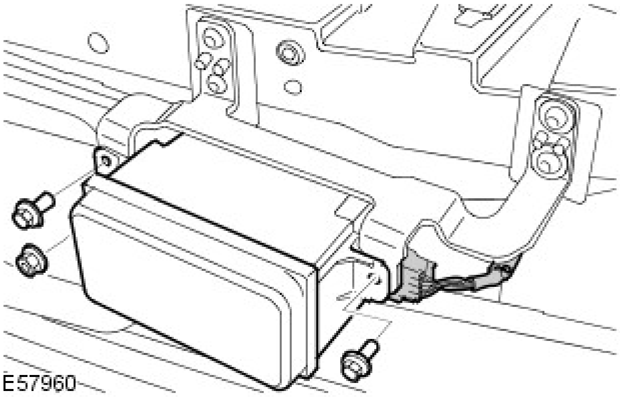
4. Remove the speed control sensor.
   - Remove the 2 bolts.
   - Remove the nut.
   - Release and disconnect the electrical connector.



E57960

Installation

1. Install the speed control sensor.
   - Tighten the nuts and bolts to 10 Nm (7 lb.ft).
   - Connect and secure the electrical connector.
2. Install the bumper support bracket.
   - Tighten the screws.
3. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
4. Adjust the speed control sensor.
   For additional information, refer to: Speed Control Sensor Adjustment (310-03C Speed Control - TDV6 2.7L Diesel, General Procedures).
5. Install the front bumper cover.

For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

6. Using T4, configure a new speed control sensor.

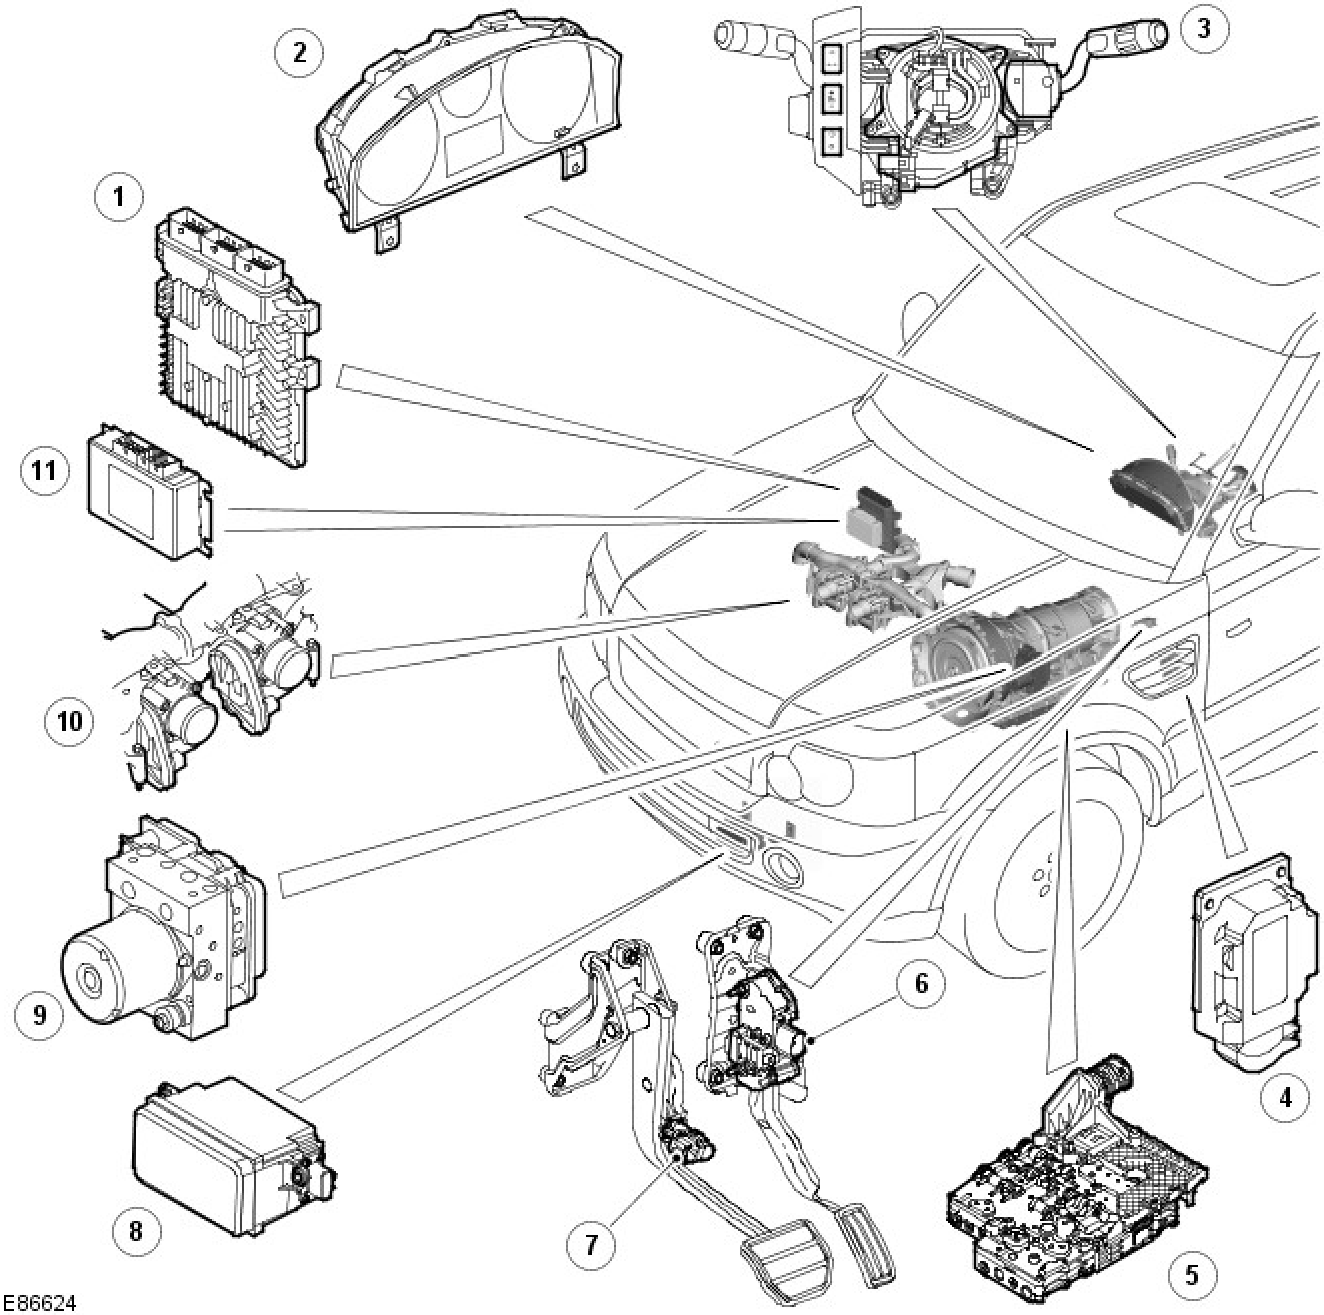
Speed Control - TDV8 3.6L Diesel - Speed Control

Description and Operation

COMPONENT LOCATION

Speed Control Component Location



Item	Part Number	Description
1	-	engine control module (ECM)
2	-	Instrument cluster
3	-	Speed control switches
4	-	Adaptive speed control module
5	-	transmission control module (TCM)
6	-	accelerator pedal position (APP)
7	-	brake pedal position (BPP) switch
8	-	Adaptive speed control radar sensor

9	-	anti-lock brake system (ABS) module
10	-	Electric throttle
11	-	Transfer box control module

OVERVIEW

The speed control system is integrated with the engine management system and uses fuelling intervention to automatically maintain a set vehicle speed. Once engaged, the system can also be used to accelerate the vehicle without using the accelerator pedal. The speed control system comprises the following components:

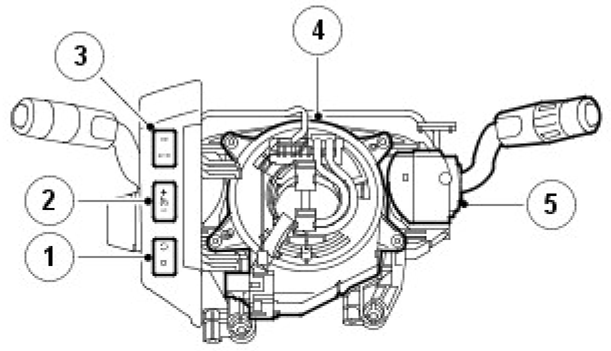
- On/Off/Suspend switch
- '+' and '-' (set/accelerate and decelerate) steering wheel switches
- Resume switch
- Clock spring
- Speed control warning lamp.

The speed control system also uses inputs from the brake pedal switch, the APP sensor, the ECM and the ABS control module.

The speed control is operated by the driver using only the steering wheel switches. When speed is active, the ECM regulates the pulse width modulation (PWM) signals to the fuel injectors to adjust the fuel supply as required to maintain the set speed.

During speed control operation, the ECM controls vehicle speed by adjusting fuel injection duration and timing. When the accelerator pedal is pressed with speed control active, the ECM outputs a calculated throttle angle signal in place of the actual throttle angle signals produced by the APP sensor. The calculated throttle angle is derived from fuel demand.

CONTROL SWITCHES



E47030

Item	Part Number	Description
1	-	Suspend/Resume switch
2	-	Accelerate/Decelerate (+/–) Switches
3	-	Adaptive speed control time gap switches
4	-	Clock spring
5	-	Wiper control column switch

The speed control switches are located on the left-hand (LH) side of the steering wheel. The switches are connected via fly leads directly to the clock spring. All the speed control switches are non-latching momentary rocker switches. The minimum set speed is 18 mph (30 (km/h). Speed control is automatically suspended if the vehicle speed falls below 15 mph (24 km/h).

The speed control switches are resistive ladder type switches. There are three rocker switches associated with speed control, two of which are for adaptive speed control (where specified). The switches vary the resistance of a signal voltage sent to the ECM. The switches receive a 5 volt reference supply. The ECM measures the returned voltage to determine which switch has been pressed.

Suspend/Resume Switch

The suspend/resume switch controls the selection of speed control. When the ignition is in position II, a single press of the suspend switch will activate the suspend mode. This temporarily switches off the speed control system, but retains the previously set speed in the ECM memory.

Resume Switch

A second press of the switch re-activates the previously set speed after the speed control has been suspended by pressing the suspend switch or by depressing the brake pedal.

Accelerate / Decelerate (+ / –) Switches

When the speed control system is active, pressing the '+' switch sets the controlled speed to the current road speed of the vehicle. Subsequent momentary presses of the switch increases the set road speed by 0.6 mph (1 km/h). If the switch is pressed and held the road speed will continue to increase until the switch is released. Momentarily pressing the '–' switch, decreases the set speed by 0.6 mph (1 km/h). If the switch is pressed and held, the set speed is decreased until the switch is released

Time Gap Adjustment Switches

The time gap adjustment switches allows the driver to adjust the length of time gap between the vehicle and the vehicle in front. The maximum time gap is 2.4 seconds and the minimum time gap is 1 second.

ADAPTIVE SPEED CONTROL

General

The adaptive speed control system comprises the following components:

- Adaptive Speed Control Sensor
- Adaptive Speed Control module
- Steering wheel control switches
- ECM
- Electric throttle
- ABS module and pump

The adaptive speed control system uses a forward looking radar sensor to scan the road ahead, looking for objects that are moving at a different rate to itself. When a target is identified the adaptive speed control system will monitor the time gap between it and the target vehicle. When that gap falls below a set driver selected level (4 seconds) the adaptive speed control system will intervene slowing the vehicle by backing off the throttle and/ or applying the brakes, until the correct gap is attained.

The system will detect but not react to the following:

- Vehicles in the oncoming lane
- Stationary vehicles
- Pedestrians
- Vehicles not in the same lane.

Adaptive speed control is active when the vehicle is moving. Adaptive Speed Control only functions when a set speed is entered in normal speed control mode. The adaptive speed control system only intervenes with the set speed when it detects a target vehicle, and then only if the minimum time gap is breached.

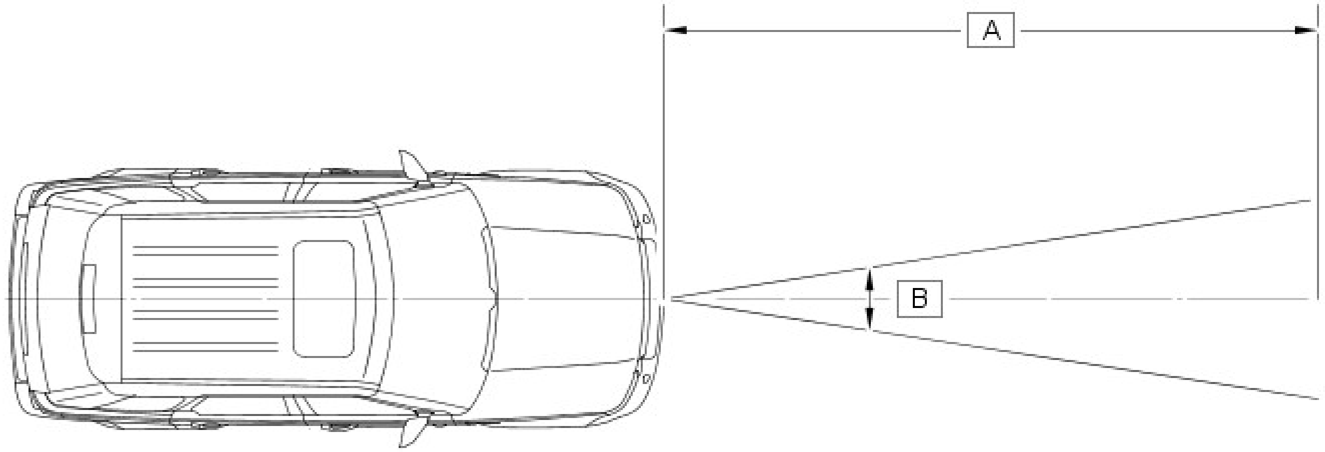
It is important to note that the system is intended for use in limited driving situations, does not remove control and responsibility from the driver, and at all times can be quickly overridden. The adaptive speed control system is not a collision warning system and will not react to stationary objects. The system does not operate below a minimum speed of approximately 30 km/h (20 mph) since it is unsuitable for use in cities or congested traffic. The system is best suited to main roads/ highways with gradual bends.

The ECM, throttle body and throttle control are unchanged from those used for non Adaptive Speed Control variants.

Radar Sensing

The adaptive speed control system is based on the use of a front mounted radar sensor. The sensor transmits a 1.5° wide beam forward of the vehicle and detects the returning signals reflected off other vehicles and objects ahead. The 1.5° wide radar beam is mechanically scanned at a rate of 10 sweeps/second across a total arc of 15° centered on the longitudinal axis of the vehicle. The radar operates at millimetric wavelengths (76 - 77 GHz) and transmits a frequency modulated continuous wave signal at a relatively low power level (no high power pulses).

Radar Viewing Angle/Range



E56519

Item	Part Number	Description
A	-	Sensor range 130 meters
B	-	Sensor scan angle 15 degrees

With the ignition switched ON, the adaptive speed control module is powered up but no radar transmissions are emitted until the vehicle is in motion.

The radar sensor detects three primary parameters of objects within the scanned arc. These are:

- Range
- Relative velocity
- Angle

- Range- the radar sensor detects the presence and ranges of different vehicles and objects within the scanned arc up to a distance of approximately 130 meters. The transmitted signal frequency changes continuously in a cyclic pattern (modulation). This means that, in the time taken for the signal wave front, to travel to and from a target vehicle (or other object), the transmission frequency will have changed. The difference between the received signal frequency and the new transmission frequency is proportional to the distance between the transmitting vehicle and the target vehicle.
- Relative speed - when the signal is reflected off a vehicle moving at a different speed (opening or closing gap) an effect known as the Doppler shift causes an extra frequency modulation to be imposed on the signal. This Doppler frequency varies with the relative speed of the vehicle being followed, enabling the system to differentiate between vehicles traveling at different speeds and also between moving vehicles and stationary objects.
- Angle of target - using a narrow angle beam to scan horizontally enables the system to distinguish between vehicles in different lanes and between vehicles and roadside objects.

Follow Mode

A set speed is selected in the normal speed control manner and this speed is maintained until a slower vehicle is encountered in the lane ahead. When the vehicle ahead comes within the effective range of the radar sensor, the system identifies it as a target vehicle and an icon is illuminated on the instrument cluster to indicate that the system is in "follow mode". When the distance between the two vehicles closes to a set time gap, the adaptive speed control system closes the throttle and if necessary applies the brakes to maintain the set time gap. Follow mode is effectively a closed loop system. If several vehicles are ahead, the closest vehicle is chosen as the target to follow. If the target vehicle moves out of radar range, or if either vehicle changes lane or drops below the minimum operating speed, the system exits follow mode and the follow mode icon is extinguished. The adaptive speed control system will only raise its speed to the originally set speed, it will not accelerate past this speed to maintain a time gap.

Driver operation of the foot brake or control switches will immediately cancel adaptive speed control.

System Restrictions

The adaptive speed control system is only intended to provide enhanced speed control as described above in certain restricted conditions. The following points should be noted:

Automatic braking is limited to approximately 20% of full pressure (0.2G) and is intended to provide a smooth, gradual deceleration in follow mode conditions. Harsh braking by the target vehicle or following the target vehicle down to very low speeds or to a halt will require driver override of the brakes.

While the radar sensor detects moving and stationary targets for assessment of the environment ahead, the system does not

react to or provide any control in situations other than follow mode conditions. Stationary or slow moving vehicles (below 10 km/h), pedestrians, objects on the road and oncoming vehicles in the same lane are not recognized.

WARNING: It must be emphasized that the adaptive speed control system is not a collision warning or avoidance system and that, other than the limited conditions of follow mode, driver intervention will be necessary to control the vehicle speed.

In follow mode, some situations may cause target ambiguities for the detection system. These situations include:

- The nearby presence of a third vehicle when driving on a line slightly offset to the target vehicle
- Vehicles edging into the lane ahead which are not detected by the system until they have moved into the radar beam.

On the approach to, or exit from a bend, a target vehicle may be lost or a new target acquired as vehicles ahead change their angular position with respect to the radar sensor. On a straight road, if the sensing vehicle is in follow mode below its selected set speed, losing the target vehicle will cause the sensing vehicle to accelerate to this set speed. This acceleration is undesirable either on, or entering a bend when the target is suddenly lost, and in this situation the system inhibits the resumption of the set speed.

The speed control system compares vehicle speed data from the ABS system with the relative speed of an external object as detected by the radar sensor to ascertain whether the object is stationary or not.

• NOTE: If tires are fitted which are different in diameter from those specified for the vehicle, the vehicle speed calculated by the ABS will not be the true road speed. This situation may cause stationary objects to be falsely identified as moving vehicles and result in automatic deceleration on a clear road.

Removal and Installation

Removal

- WARNINGS:

⚠ Persons working on the supplemental restraint system (SRS) must be fully trained and have been issued with the safety guidelines.

⚠ Allow a period of 10 minutes to elapse after disconnecting the battery before undertaking any work on the SRS.

⚠ The SRS electrical connectors are unique. DO NOT force, or attempt to connect electrical connectors to the wrong sockets.

⚠ The correct procedures must always be used when working on SRS components.

⚠ It is imperative that before any work is undertaken on the SRS system, the appropriate information is read thoroughly.

⚠ Always disconnect both battery cables before beginning work on the SRS system. Disconnect the ground cable first. Never reverse connect the battery.

⚠ Take extra care when handling SRS components.

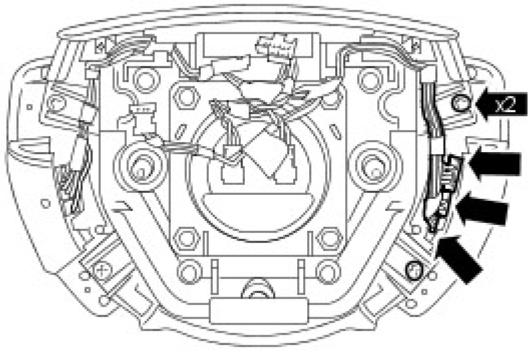
1. Make the air bag supplemental restraint system (SRS) safe.
For additional information, refer to: Standard Workshop Practices (100-00 General Information, Description and Operation).

2. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

3. Remove the driver air bag module.
For additional information, refer to: Driver Air Bag Module (501-20B Supplemental Restraint System, Removal and Installation).

4. Remove the speed control switch.

- Disconnect the 3 electrical connectors.
- Remove the 2 screws.



E80260

Installation

1. Install the speed control switch.

- Connect the 3 electrical connectors.
- Install the 2 screws and tighten to 3 Nm (2 lb.ft).

2. Install the driver air bag module.
For additional information, refer to: Driver Air Bag Module (501-20B Supplemental Restraint System, Removal and

Installation).

3. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Climate Control System - General Information - Climate Control System

Diagnosis and Testing

Overview

The complexity of the system is such that it is broken down into sub-sections.

For a detailed description of climate control operation, refer to the relevant section of the workshop manual.

Distribution motor self-test

The motor and flap operation can be checked using the on-board distribution motor self-test function.

The self-test can be initiated by pressing and holding the **ECON** and **RECIRC** buttons while turning the ignition switch to the **ON** position.

The control module will then compare the current motor position with the values stored in the module and will indicate an error by flashing the **ECON** LED (light emitting diode).

If there are no errors, the LED will go out and the system will function normally.

To confirm that there are no errors, turn the ignition switch to the **OFF** position, then back to the **ON** position.

Observe the operation of the **programmed defrost** LED.

If there are errors present, the **programmed defrost** LED will flash and the system will attempt to calibrate itself.

For additional information on the function of the system, refer to the relevant section of the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
● Coolant level ● Air vents (contaminated/blocked) ● Auxiliary drive belt condition and tension ● Air conditioning compressor	● Fuses ● Harnesses ● Electrical connector(s) ● Relays ● Control module(s) ● Control panel(s) ● Air conditioning compressor

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom chart

Symptom chart

Symptom	Possible causes	Action
No climate control function, flashing LED at start-up	● The system is in calibration mode	Check the motors and levers at the heating and ventilation assembly for damage/foreign objects jamming the movement of the flaps. For additional information on the self-calibration process, see the distribution motor self-test above.
Poor or no cooling	● Air conditioning function	Carry out the checks from the visual inspection, refer to the relevant section of the workshop manual.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to

the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

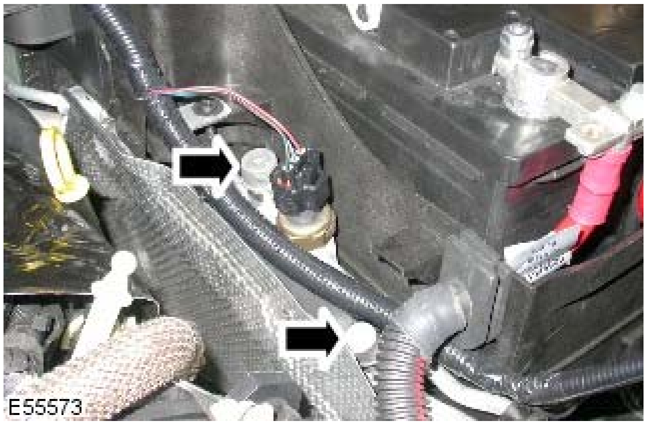
Climate Control System - General Information - Air Conditioning (A/C) System Recovery, Evacuation and Charging

General Procedures

⚠ WARNING: Servicing must be carried out by personnel familliar with both vehicle system and the charging and testing equipment. All operations must be carried out in a well ventilated area away from open flame and heat sources.

- NOTE: The receiver drier need only be changed under the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure); the system is leaking and refrigerant has been lost to atmosphere; refrigerant circuit has been open more than 24 hours due to repair.



1. **Refrigerant recovery:** Remove the dust covers from the high and low pressure connections.
2. Connect the high and low pressure lines to the appropriate connections.
3. Open the valves on the connections.
4. Turn the valves on the station to the correct positions.
5. Turn the process switch to the correct position.
6. Turn the main switch to 'ON'.
7. ⚠ WARNING: Refrigerant must always be recycled before re-use to ensure that the purity of the refrigerants high enough for safe use in the air conditioning system. Recycling should always be carried out with equipment which is design certified by Underwriter Laboratory Inc. for compliance with SEA J1991. Other equipment may not recycle refrigerant to the required level of purity. R143a Refrigerant Recover Recycling Recharging station must not be used with any other type of refrigerant. Refrigerant R134a from domestic and commercial sources must not be used in motor vehicles air conditioning systems.

   Allow the system to recover the refrigerant from the system.
8. Close the valves on the refrigerant station.
9. Turn the main switch 'OFF'.
10. Close the valves on the connections.
11. Disconnect the high and low pressure connections.
12. Install the dust covers to the connectors.
13. Open the tap at the rear of the station to drain the refrigerant oil.
14. Measure and record the quantity of refrigerant oil recovered from the system.
15. Close the tap at the rear of the station.
16. **Evacuation:** Remove the dust covers from the high and low pressure connections.

17. Connect the high and low pressure lines to the appropriate connections.

18. Open the valves on the connections.

19. Turn the valves on the station to the correct positions.

20. Turn the process switch to the correct position.

21. Turn the main switch to 'ON'.

22. Allow the station to evacuate the A/C system.

23. ⚠ CAUTION: The system must be evacuated immediatley before recharging commences. Delay between evacuation and recharging is not permitted

Recharging: Close the valves on the refrigerant station.

24. Close the valve on the oil charger.

25. Disconnect the yellow line from the refrigerant station.

26. Remove the cover from the oil charger.

27. Pour the correct quantity of refrigerant oil into the oil charger.

28. Install the cover to the oil charger.

29. Connect the yellow line to the refrigerant station.

30. Open the valve on the oil charger.

31. Move the pointer on the refrigerant gauge to mark the position of the refrigerant drop.

32. Slowly open the correct valve on the refrigerant to allow the vacuum to pull the refrigerant into the system.

33. Close the valve on the refrigerant station when the correct amount of refrigerant has been drawn into the air conditioning system.

34. Turn the main switch 'OFF'.

35. Close the valves on the connections.

36. Disconnect the high and low pressure connections.

GENERAL

The air distribution and filtering system controls the distribution and quality of air supplied to the vehicle interior. The system consists of:

- Air ducts.
- Air registers and vents.
- A cabin air filter.

AIR DUCTS

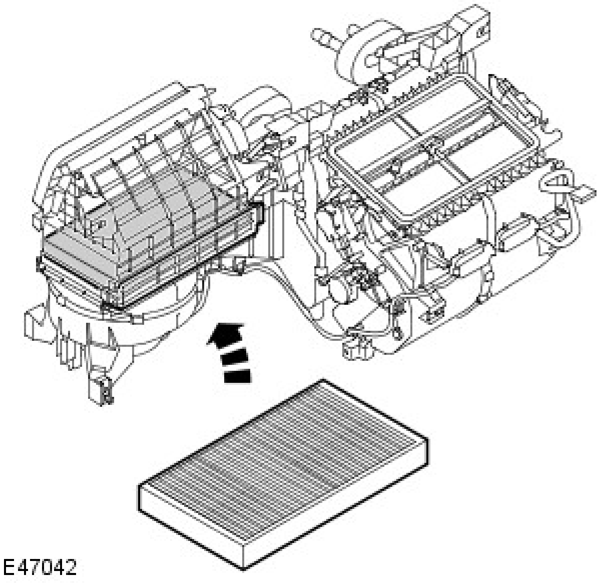
The air ducts distribute the air from the heater to the various registers and air vents around the vehicle interior. The air ducts for the instrument panel registers, the driver lap register and the second row registers are connected to the heater outlet manifold on top of the heater. The air ducts for the front and second row footwells are connected direct to outlet ports on the heater. The air ducts for the windshield vents and the side window vents form part of the structure of the instrument panel.

AIR REGISTERS AND VENTS

The air registers allow occupants to control the flow and direction of air from the air ducts. The driver lap register has moveable vanes to regulate the flow and direction of the air. The instrument panel and second row registers each have a thumbwheel to regulate flow, and moveable vanes to control direction.

The air vents are fixed outlets either integrated into the end of the air duct or installed in the trim panel connected to the air duct.

CABIN AIR FILTER



The cabin air filter is a combined pollen and odor filter installed in the air inlet duct. The filter removes particulates and unpleasant odors from the fresh and recirculated air entering the blower.

Diagnosis and Testing

Overview

The air distribution and filtering system is a fairly straightforward design requiring no specialized techniques for diagnosis.

For information on the description and operation of the system:
REFER to: Air Distribution and Filtering (412-01 Air Distribution and Filtering, Description and Operation).

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical faults.

Mechanical
● Air ducts ● Air registers/vents ● Pollen filter (blocked/contaminated)

For the most part, faults will be confined to blocked or damaged registers or blocked vents.

Check for foreign objects finding their way into vents and registers and rectify as necessary. There is a self-test procedure for the motors and flaps controlling the air flow to the registers:
REFER to: Climate Control System (412-00 Climate Control System - General Information, Diagnosis and Testing).

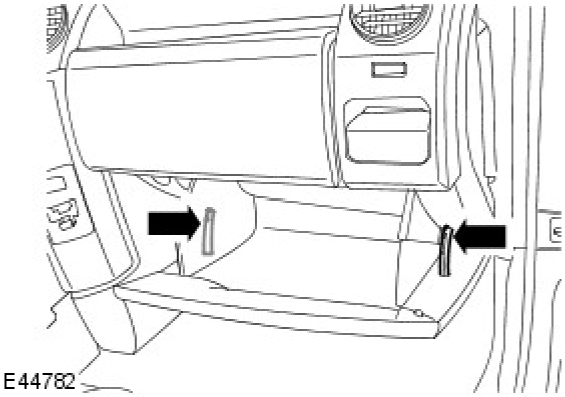
3. **3.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) which may have been set as a result of a blocked or damaged flap.
    - For a list of DTCs relating to the climate control system:
      REFER to: Climate Control System (412-00 Climate Control System - General Information, Diagnosis and Testing).
    - Make sure that all DTCs are cleared following rectification.

The pollen filter must be replaced at the specified intervals to make sure the operation of the system is not affected.
REFER to: Pollen Filter (412-01 Air Distribution and Filtering, Removal and Installation).

Air Distribution and Filtering - Pollen Filter

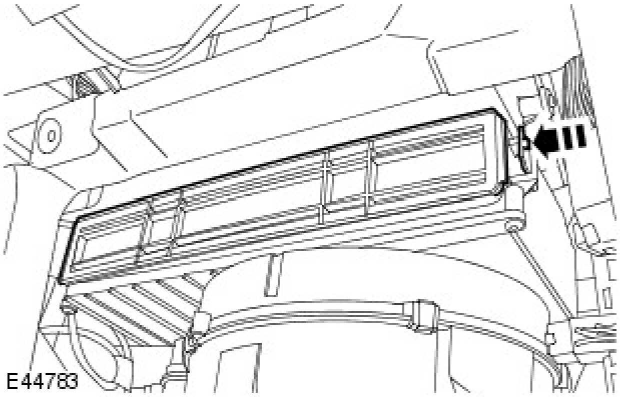
Removal and Installation

Removal



1. Open the glove compartment to the service condition.

- Release the glove compartment latch stops.



2. Remove the pollen filter housing cover.

3. Remove the pollen filter.

Installation

1. To install, reverse the removal procedure.

- Clean the component mating faces.

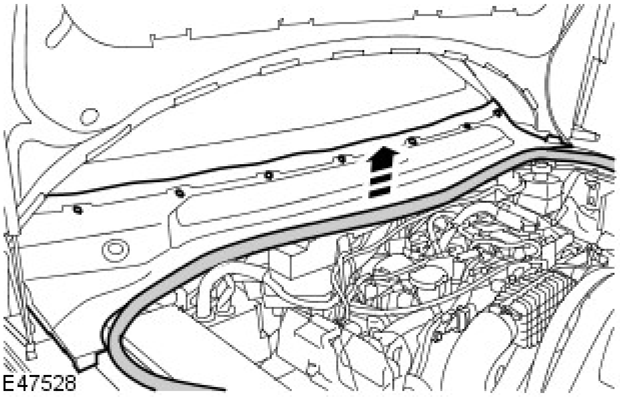
Published: 11-May-2011

Air Distribution and Filtering - Plenum Chamber

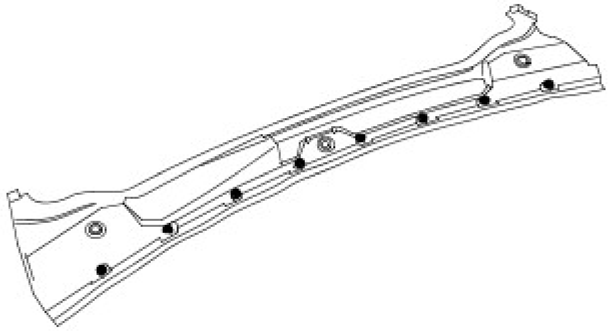
Removal and Installation

Removal

1. Remove the A-pillar mouldings.
   For additional information, refer to: A-Pillar Moulding LH (501-08 Exterior Trim and Ornamentation, Removal and Installation).
2. Remove the windshield wiper arms.
   For additional information, refer to: Front Wiper Pivot Arm (501-16 Wipers and Washers, Removal and Installation).
3. Release the hood seal from the plenum chamber.



4. Remove the plenum chamber panel.
   - Release the 8 clips.



5. NOTE: Do not disassemble further if the component is removed for access only.

   Remove the clips from the plenum chamber panel.

Installation

1. To install, reverse the removal procedure.

E54966

Item	Part Number	Description
1	-	Blower relay
2	-	Blower control module
3	-	Blower
4	-	Air inlet duct
5	-	Heater

6	-	Ventilation outlets

GENERAL

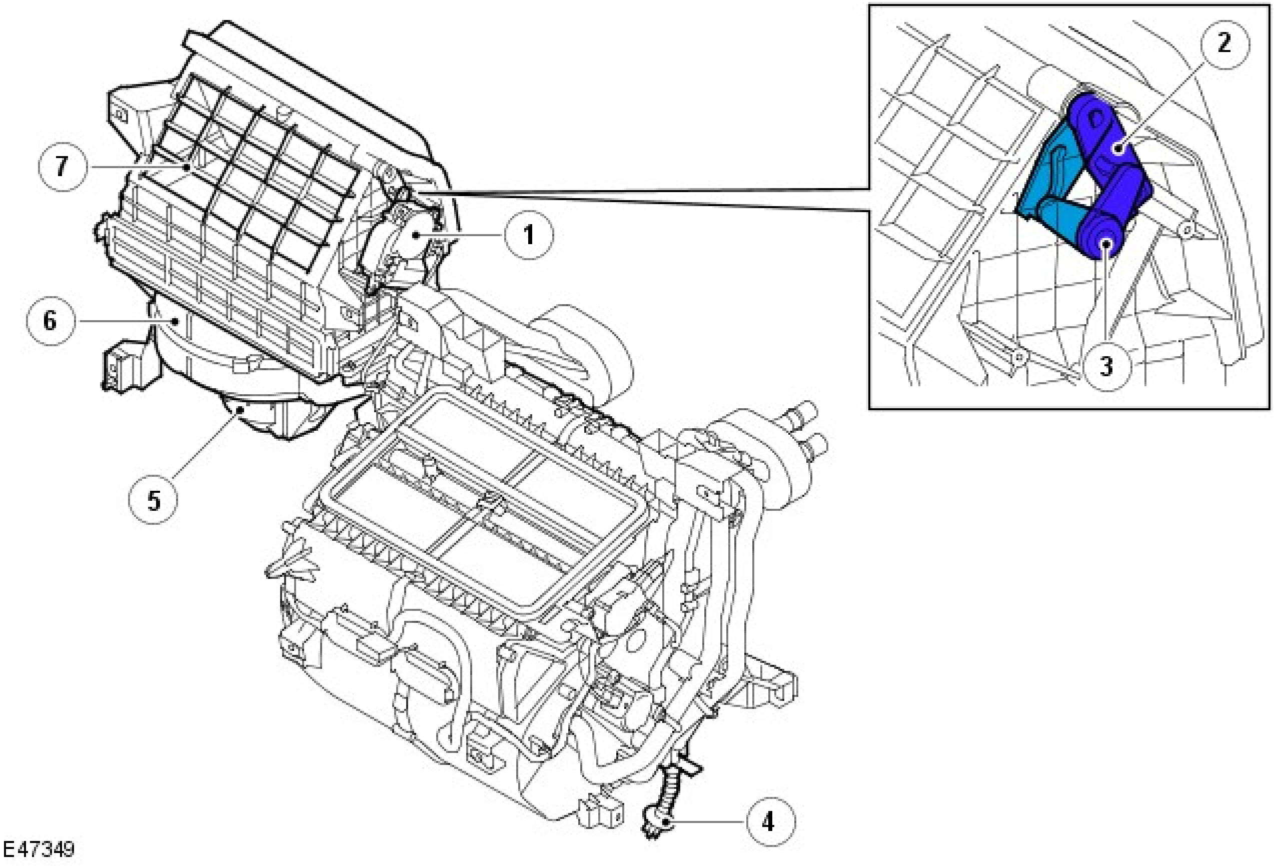
The heating and ventilation system controls the temperature and flow of air supplied to the vehicle interior. The system consists of:

- An air inlet duct.
- A blower.
- A blower control module.
- A blower relay.
- A heater.
- Two ventilation outlets.

Fresh or recirculated air flows into the heater assembly from the inlet duct. The blower, and ram effect when the vehicle is moving, forces the air through the heater assembly. Air from the cabin exhausts through the ventilation outlets.

AIR INLET DUCT

• NOTE: RHD version shown, LHD mirror image



Item	Part Number	Description
1	-	Recirculation door motor
2	-	Recirculation door arm
3	-	Recirculation motor arm
4	-	Evaporator drain tube
5	-	Blower
6	-	Air inlet duct
7	-	Recirculation air inlet

The air inlet duct is installed behind the instrument panel, on the front passenger side, and connected between the plenum chamber below the windshield and the heater.

The plenum chamber is formed by the upper and lower cowl and a plenum molding. Grilles in the plenum molding allow fresh air into the plenum chamber. From the plenum chamber, the air passes through a water separator and into the fresh air inlet of the air inlet duct.

The air inlet duct incorporates a grille to provide the inlet for recirculated air from the vehicle interior. The air inlet duct also accommodates:

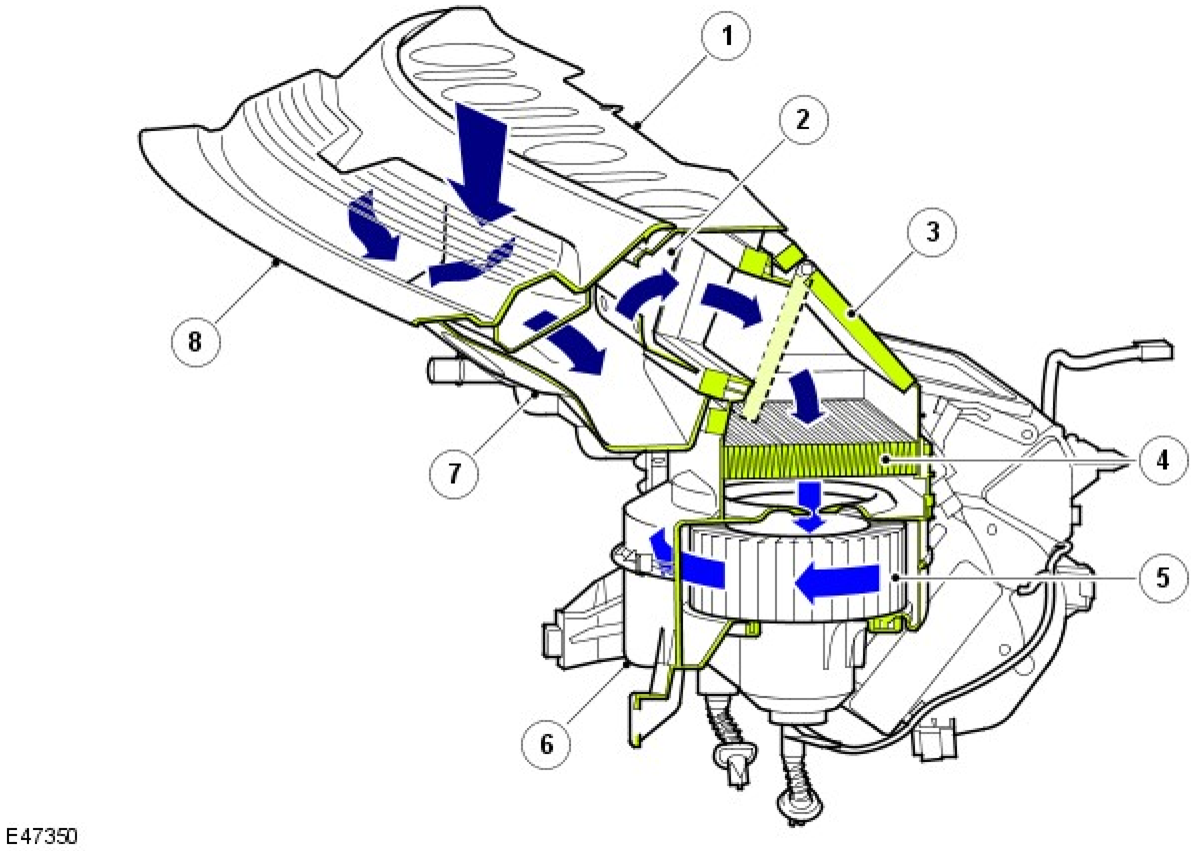
- The cabin air filter.
  For additional information, refer to: Air Distribution and Filtering (412-01 Air Distribution and Filtering, Description and Operation).
- The blower.
- The blower control module.

The outlet from the air inlet duct forms the rear wall of the heater, enclosing the evaporator and incorporating the two evaporator drain outlets. Drain tubes connect the evaporator drain outlets to the transmission tunnel, to direct the water that condenses on the evaporator overboard.

A recirculation door is installed between the fresh and recirculated air inlets, to control the source of incoming air. A lever on the recirculation door is driven by the recirculation door motor. Operation of the recirculation door motor is automatically controlled by the automatic temperature control (ATC) module and manually controlled by a switch on the ATC module control panel.
For additional information, refer to: Control Components (412-04 Control Components, Description and Operation).

Fresh or recirculated air enters the air inlet duct and passes through the cabin air filter to the hub of the blower. From the blower, the air flows to the outlet of the air inlet duct and into the heater. The blower, and ram effect from the forward motion of the vehicle, forces the air through the air inlet duct.

Air Flow Through Air Inlet Duct



Item	Part Number	Description
1	-	Upper cowl
2	-	Water separator
3	-	Recirculation door
4	-	Cabin air filter
5	-	Blower
6	-	Air inlet duct casing
7	-	Lower cowl
8	-	Plenum molding

BLOWER

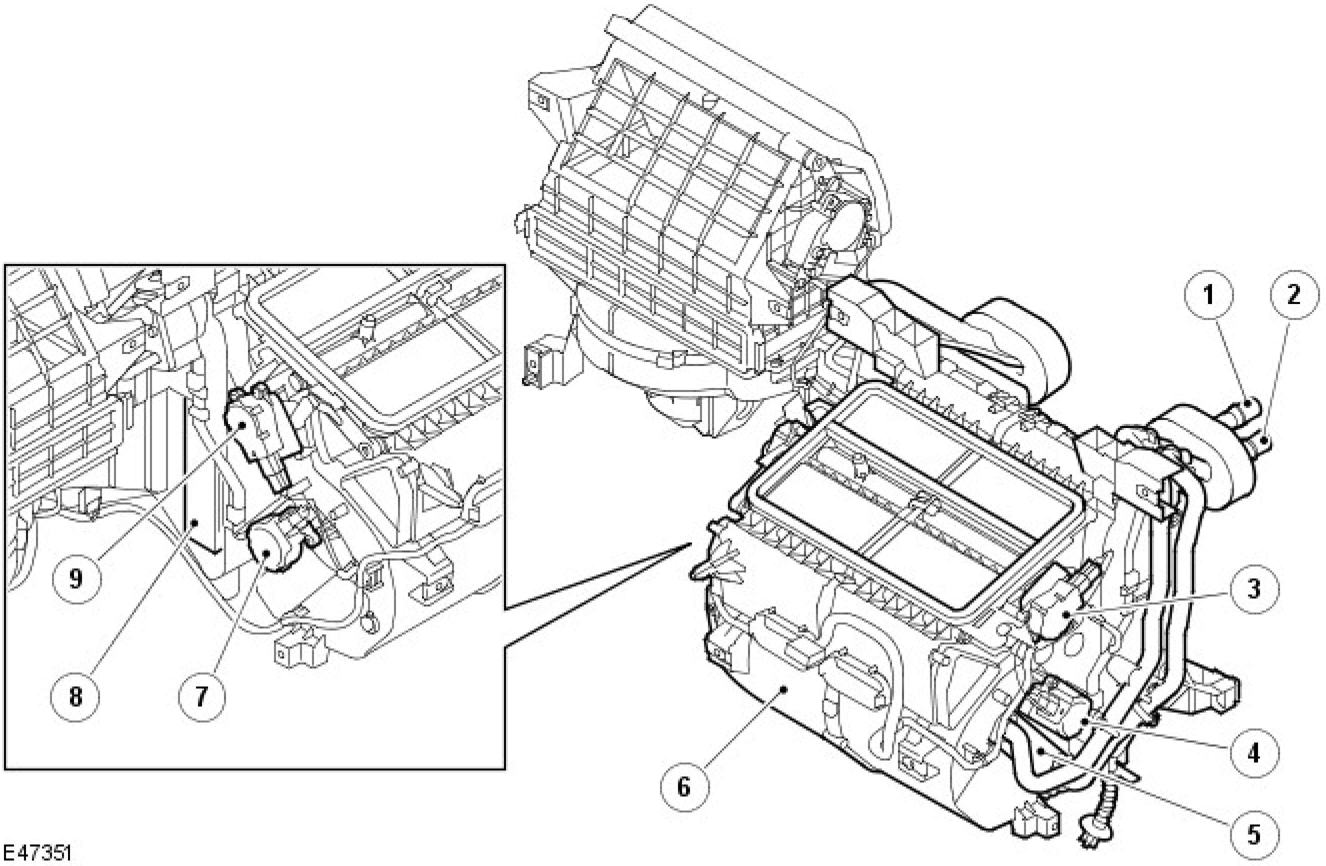
The blower is installed in the air inlet duct, below the cabin air filter, and consists of an open hub, centrifugal fan powered by an electric motor. Operation of the blower is controlled by the ATC module, using the blower relay in the battery junction box (BJB) and the blower control module. The blower control module is installed in the air inlet duct downstream of the blower, where any heat generated during operation is dissipated by the air flow. A wiring harness on the air inlet duct connects the recirculation door motor, blower and blower control module to the vehicle wiring.

When the blower is required, the ATC module energizes the coil of the blower relay. The energized blower relay supplies battery power to the blower motor, which is connected to ground through the blower control module. The speed of the blower is controlled by the blower control module, which regulates the blower motor voltage in response to a pulse width modulation (PWM) signal from the ATC module. To vary the blower motor voltage the ATC module varies the duty cycle of the PWM signal.

When the blower is in the automatic mode the ATC module determines the blower speed required from the comfort algorithms. When the blower is in the manual mode, the ATC module operates the blower at one of seven fixed speeds as selected on the control panel.
For additional information, refer to: Control Components (412-04 Control Components, Description and Operation).

HEATER

- NOTE: RHD unit shown, LHD units similar



Item	Part Number	Description
1	-	Coolant outlet pipe
2	-	Coolant inlet pipe
3	-	Windshield distribution door motor
4	-	right-hand (RH) temperature blend motor
5	-	Heater core
6	-	Heater casing
7	-	left-hand (LH) temperature blend motor
8	-	Evaporator
9	-	Face and feet distribution door motor

The heater controls the temperature of the air supplied to the distribution ducts, as directed by the ATC module. The heater is installed on the vehicle center-line, between the instrument panel and the engine bulkhead. The heater consists of a casing, formed from plastic moldings, which contains an evaporator, heater core and control doors. Internal passages integrated into the casing guide the air through the casing and separate it into two flows, one for the LH outlets and one for the RH outlets.

When the air conditioning (A/C) system is operating, the evaporator cools the air entering the heater.

The heater core provides the heat source to warm the air being supplied to the distribution ducts. The heater core is an aluminum two pass, fin and tube heat exchanger, installed across the width of the heater housing. Two aluminum tubes attached to the heater core extend through the engine bulkhead to connect with the engine cooling system. When the engine is running, coolant is constantly circulated through the heater matrix by the coolant pump. On vehicles with a FFBH (fuel fired booster heater), when the FFBH is active the coolant flow is assisted by an electric circulation pump.
For additional information, refer to: Auxiliary Heater (412-02B Auxiliary Heating, Description and Operation).

Two temperature blend doors, one LH and one RH, regulate the flow of air through the heater core to control the temperature of the air leaving the heater. The two temperature blend doors operate independently to allow different temperatures to be set for the LH and RH outlets. Each temperature blend door is driven by a separate stepper motor.

A drive arm is attached to the drive spindle of each temperature blend door stepper motor. The end of the stepper motor drive arm engages with a slot in the drive arm of the related temperature blend door.

Operation of the temperature blend door stepper motors is controlled by the ATC module.
For additional information, refer to: Control Components (412-04 Control Components, Description and Operation).

Air Flow Through Heater

8	-	Air inlet duct casing
9	-	Evaporator

VENTILATION OUTLETS

The ventilation outlets promote the free flow of air through the passenger compartment. The outlets are installed in the LH and RH rear quarter body panels, behind the tail lamps.

Each ventilation outlet consists of a grille covered by soft rubber flaps and is effectively a non-return valve. The flaps open and close automatically depending on the differential between cabin and outside air pressures.

Heating and Ventilation - Heating and Ventilation

Diagnosis and Testing

Overview

The heating and ventilation system is a fairly straightforward design requiring no specialized techniques for diagnosis.

Follow the visual inspection below and refer to the diagnostic trouble code (DTC) index for electrical faults.

For information on the description and operation of the system, refer to the relevant section of the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
● Intake ducts blocked/restricted ● Coolant level ● Air in cooling system ● Distribution motors and flaps	● Fuses ● Harnesses and connectors ● Blower relay ● Blower control module ● Blower assembly ● Automatic temperature control module

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any DTCs before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom chart

Symptom	Possible causes	Action
Air intake stuck in one position	● Sensor fault ● Distribution motor fault	Check for DTCs indicating a sensor fault (refer to the DTC index below). Carry out the distribution motor self-test. Refer to the relevant section of the workshop manual.
Excessive blower noise	● Blower mechanical fault ● Debris drawn into the blower ● Solar sensor fault	Check for mechanical faults/debris in the blower motor or fixings. Check for DTCs indicating a sensor fault.
Unable to control the air flow or temperature	● Distribution motor fault(s) ● Control module fault	Carry out the distribution motor self-test. Refer to the relevant section of the workshop manual. Check for DTCs indicating a module fault (refer to the DTC index below).
No hot air	● Cooling system fault ● Viscous fan locked ● Distribution motor fault(s) ● Control module fault	Check the coolant level, viscous fan operation, etc. Carry out the distribution motor self-test. Refer to the relevant section of the workshop manual. Check for DTCs indicating a module fault (refer to the DTC index below).

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

- NOTE: For a full list of climate control DTCs, refer to the Control Components section of the workshop manual.

DTC	Description	Possible causes	Action
B1A5911	Sensor 5 Volt Supply	● Ambient air temperature sensor 5 volt supply short circuit to ground	Refer to the electrical guide and check the ambient air temperature sensor circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A6312	Right Solar Sensor	● Right-hand solar sensor signal short circuit to 5 volts	Refer to the electrical guides and check the right-hand sunlight sensor sensor circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A6412	Left Solar Sensor	● Left-hand solar sensor signal short circuit to 5 volts	Refer to the electrical guides and check the left-hand sunlight sensor sensor circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1B6013	Feedback Potentiometer Circuit	● Air intake stuck in one position ● Feedback potentiometer circuit high resistance	Check the feedback potentiometer/air temperature mode motor circuits. Refer to the electrical guides.
B1B6711	Air Intake Servo Potentiometer Circuit	● Recirculation motor signal short circuit to ground	Check the intake air motor circuit. Refer to the electrical guides. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1B6715	Air Intake Servo Potentiometer Circuit	● Recirculation motor signal high resistance ● Recirculation motor signal short circuit to power	Check the intake air motor circuit. Refer to the electrical guides. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1B6801	Air Intake Servo Motor	● Recirculation motor fault	Check the intake air motor circuit. Refer to the electrical guides. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1B7400	Foot/Defrost Damper Actuator	● Actuator mechanical fault ● Actuator overheating ● Actuator circuit high resistance ● Actuator circuit short circuit ● Actuator power failure	Check for mechanical faults with the face/feet distribution motor (see visual inspection). Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1B7449	Foot/Defrost Damper Actuator	● Actuator internal fault	Check the face/feet distribution motor operation. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1B7700	Front Right Air Blend Stepper Actuator	● Actuator mechanical fault ● Actuator overheating ● Actuator circuit high resistance ● Actuator circuit short circuit ● Actuator power failure	Check for the right-hand air temperature motor mechanical faults (see visual inspection). Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1B7749	Front Right Air Blend Stepper Actuator	● Actuator internal fault	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

Heating and Ventilation - Blower Motor

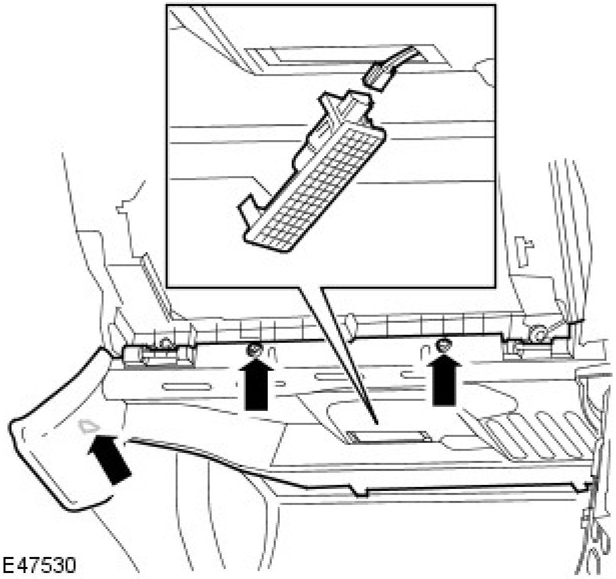
Removal and Installation

Removal

1. Remove the glove compartment.
For additional information, refer to: Glove Compartment (501-12 Instrument Panel and Console, Removal and Installation).

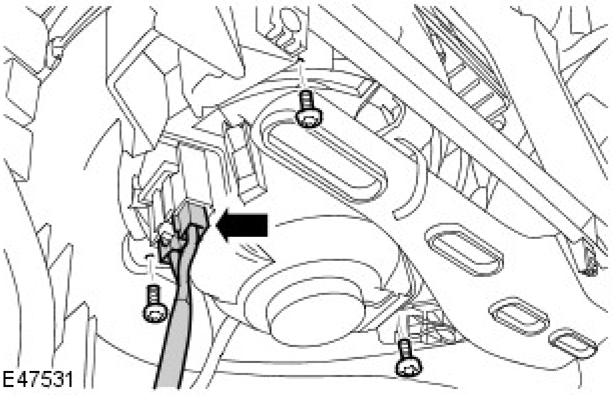
2. Remove the passenger side closing trim panel.

- Release the clip.
- Remove the 2 screws.
- Disconnect the electrical connector.



3. Position the footwell duct aside for access.

- Release the clip.



4. Remove the blower motor.

- Disconnect the electrical connector.
- Remove the 3 screws.

Installation

1. ⚠ CAUTION: Fixings must be started by hand to avoid damaging threads.

Install the blower motor.

- Tighten the screws.
- Connect the electrical connector.

2. Secure the footwell duct.

- Install the clip.

3. Install the closing trim panel.

- Connect the electrical connector.
- Secure the clip.
- Tighten the screws.

4. Install the glove compartment.
For additional information, refer to: Glove Compartment (501-12 Instrument Panel and Console, Removal and Installation).

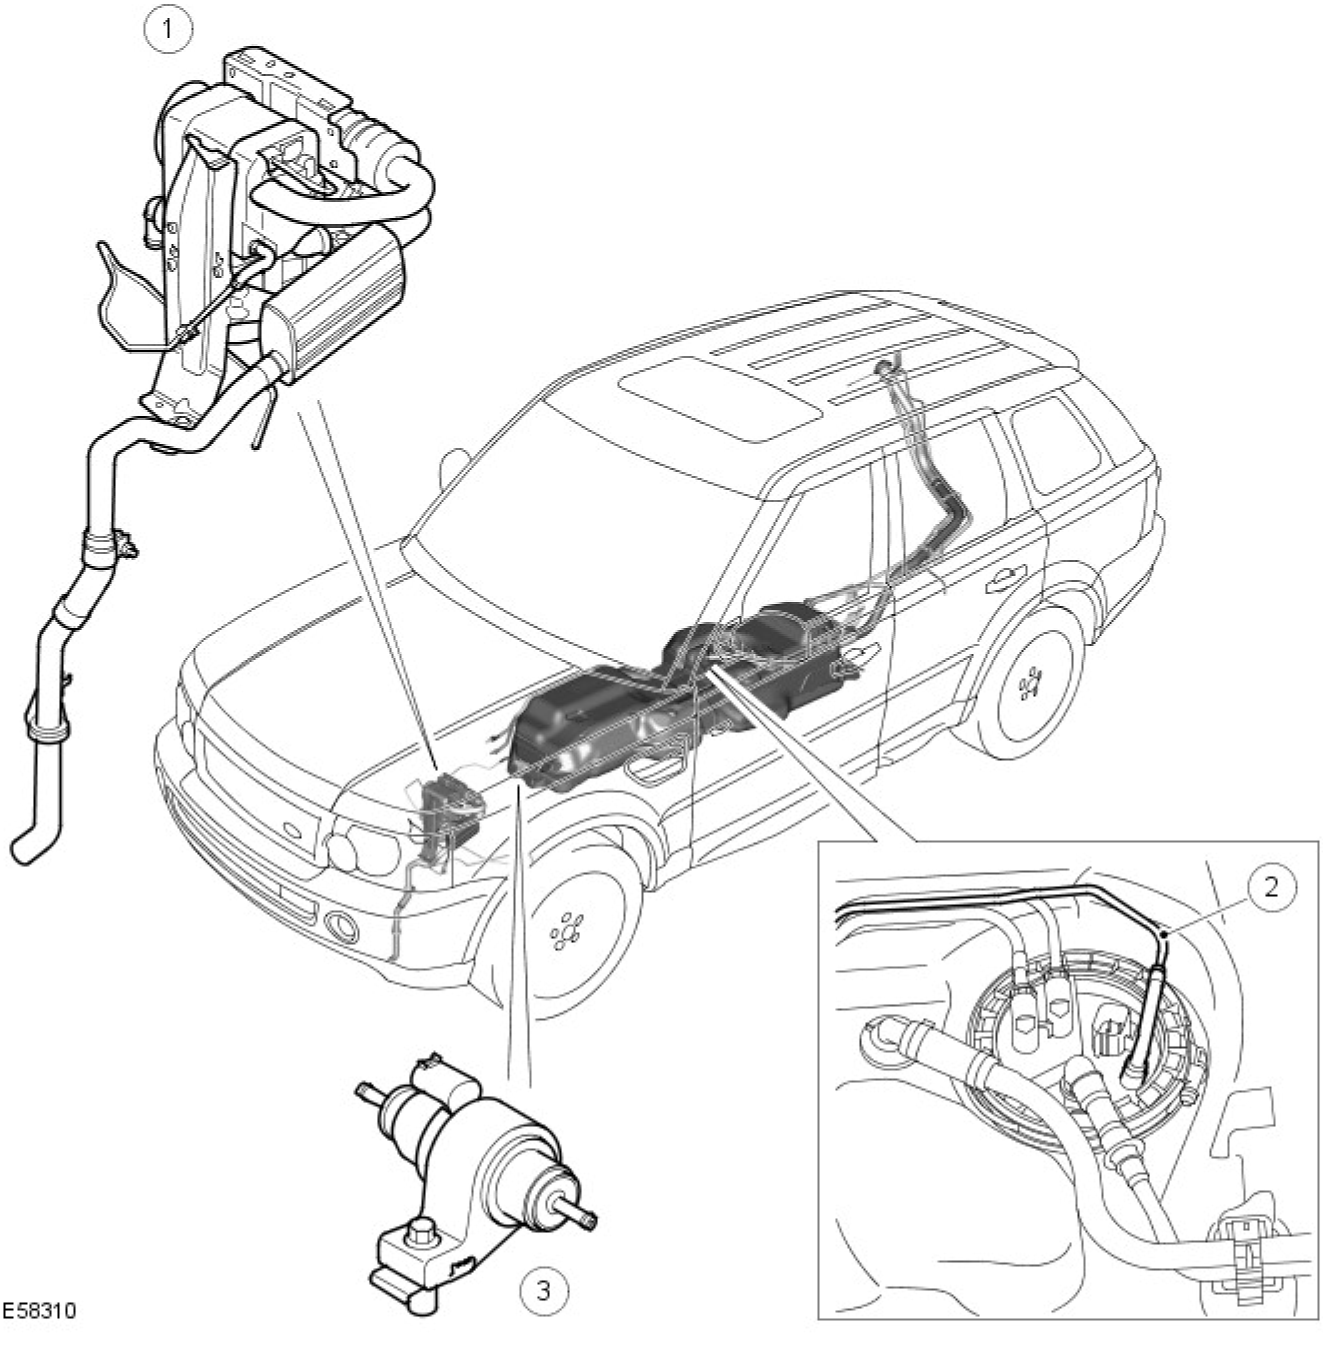
Auxiliary Heating - Auxiliary Heater

Description and Operation

COMPONENT LOCATIONS



Item	Part Number	Description
1	-	FFBH (fuel fired booster heater)
2	-	Fuel line connection with fuel tank
3	-	Auxiliary fuel pump

GENERAL

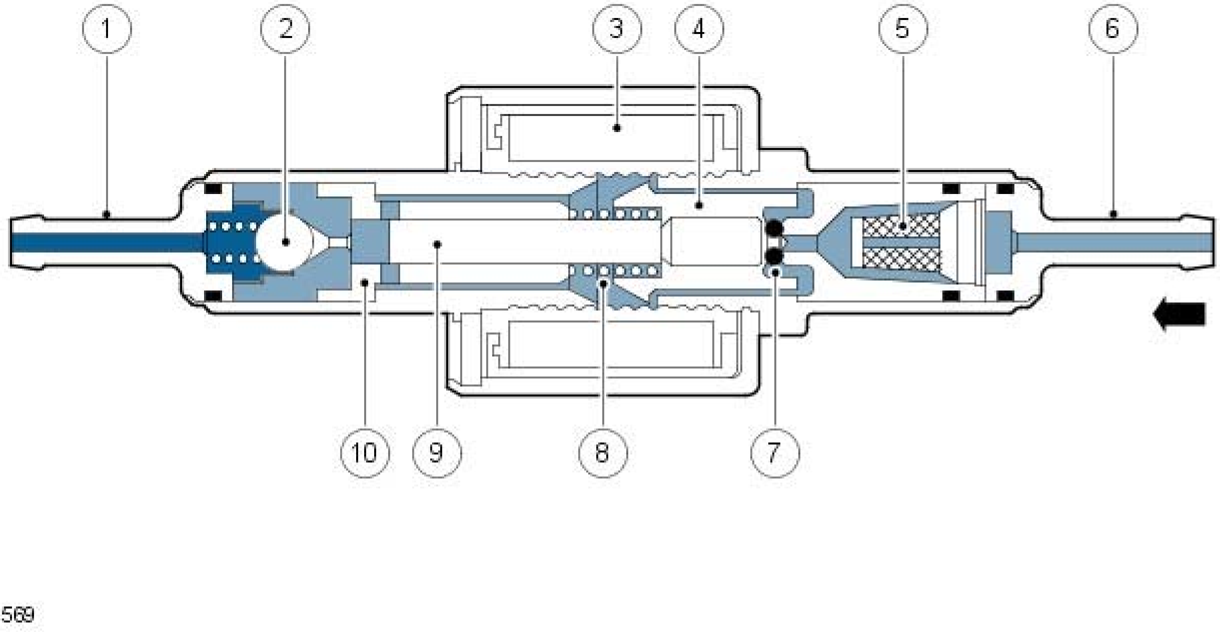
In some markets diesel models have auxiliary heating provided by a FFBH, which boosts the temperature of the engine coolant supplied to the vehicle heater assembly. Fuel for the FFBH is taken from the vehicle fuel tank, through a fuel line attached to the fuel pump module. In the FFBH, the fuel is burned and the resultant heat output is used to heat the engine coolant. The FFBH system supplements vehicle heater performance while the engine is running, and is transparent to the driver.

Operation of the FFBH is controlled by the automatic temperature control (ATC) module and a control module in the FFBH. Operation is automatic when the engine is running, depending on the ambient air temperature and the engine coolant temperature (ECT).

AUXILIARY FUEL PUMP

The auxiliary fuel pump regulates the fuel supply to the FFBH. The pump is installed in a rubber mounting attached to the chassis, immediately in front of the fuel tank. The pump is a self priming, solenoid operated plunger pump, controlled by a pulse width modulation (PWM) signal from the control module in the FFBH. When the pump is de-energized, it provides a positive shut-off of the fuel supply.

Sectioned View of Auxiliary Fuel Pump



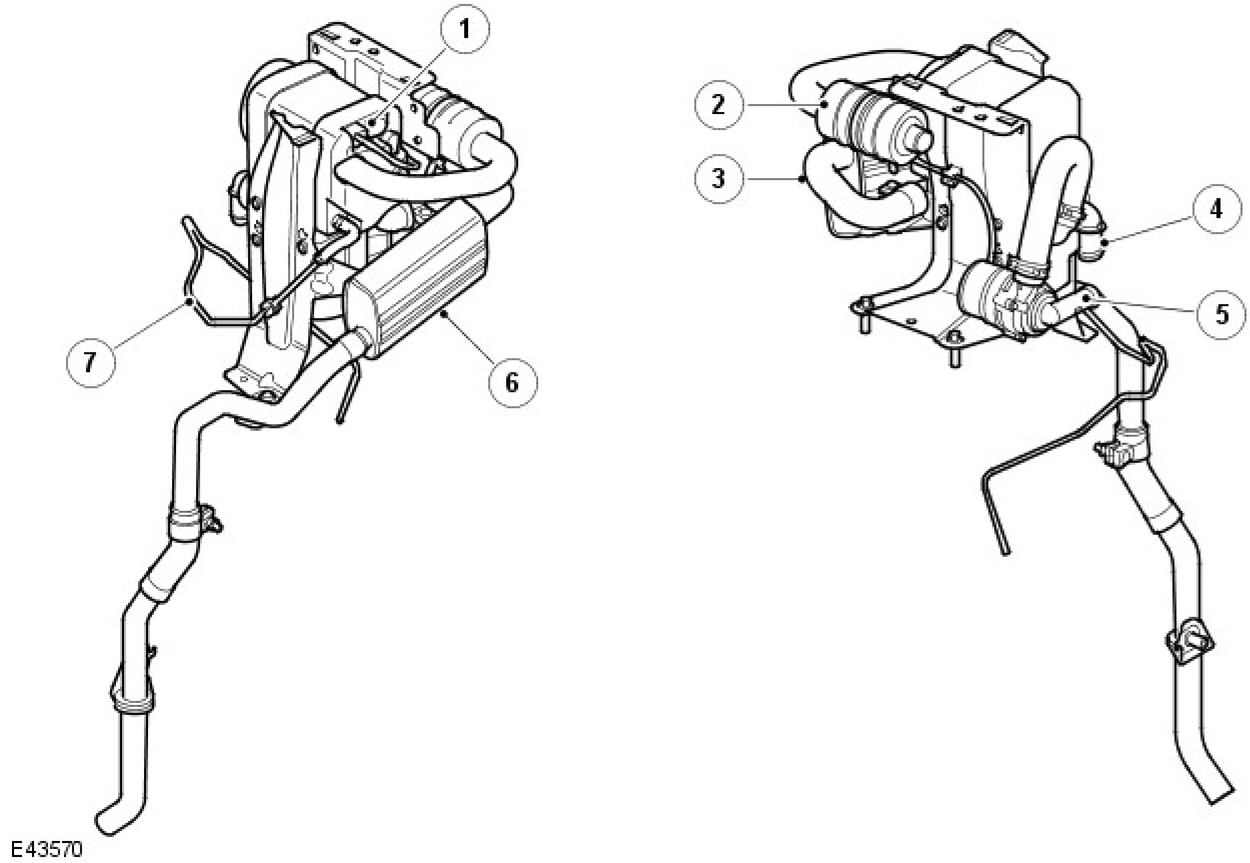
Item	Part Number	Description
1	-	Fuel line connector
2	-	Non return valve
3	-	Solenoid coil
4	-	Plunger
5	-	Filter insert
6	-	Fuel line connector
7	-	O-ring seal
8	-	Spring
9	-	Piston
10	-	Bush

The solenoid coil of the auxiliary fuel pump is installed around a housing which contains a plunger and piston. The piston locates in a bush, and a spring is installed on the piston between the bush and the plunger. A filter insert and a fuel line connector are installed in the inlet end of the housing. A non return valve and a fuel line connector are installed in the fuel outlet end of the housing.

While the solenoid coil is de-energized, the spring holds the piston and plunger in the closed position at the inlet end of the housing. An O-ring seal on the plunger provides a fuel tight seal between the plunger and the filter insert, preventing any flow through the pump. When the solenoid coil is energized, the piston and plunger move towards the outlet end of the housing, until the plunger contacts the bush; fuel is then drawn in through the inlet connection and filter. The initial movement of the piston also closes transverse drillings in the bush and isolates the pumping chamber at the outlet end of the housing. Subsequent movement of the piston then forces fuel from the pumping chamber through the non return valve and into the line to the FFBH.

When the solenoid de-energizes, the spring moves the piston and plunger back towards the closed position. As the piston and plunger move towards the closed position, fuel flows past the plunger and through the annular gaps and transverse holes in the bush to replenish the pumping chamber.

FFBH



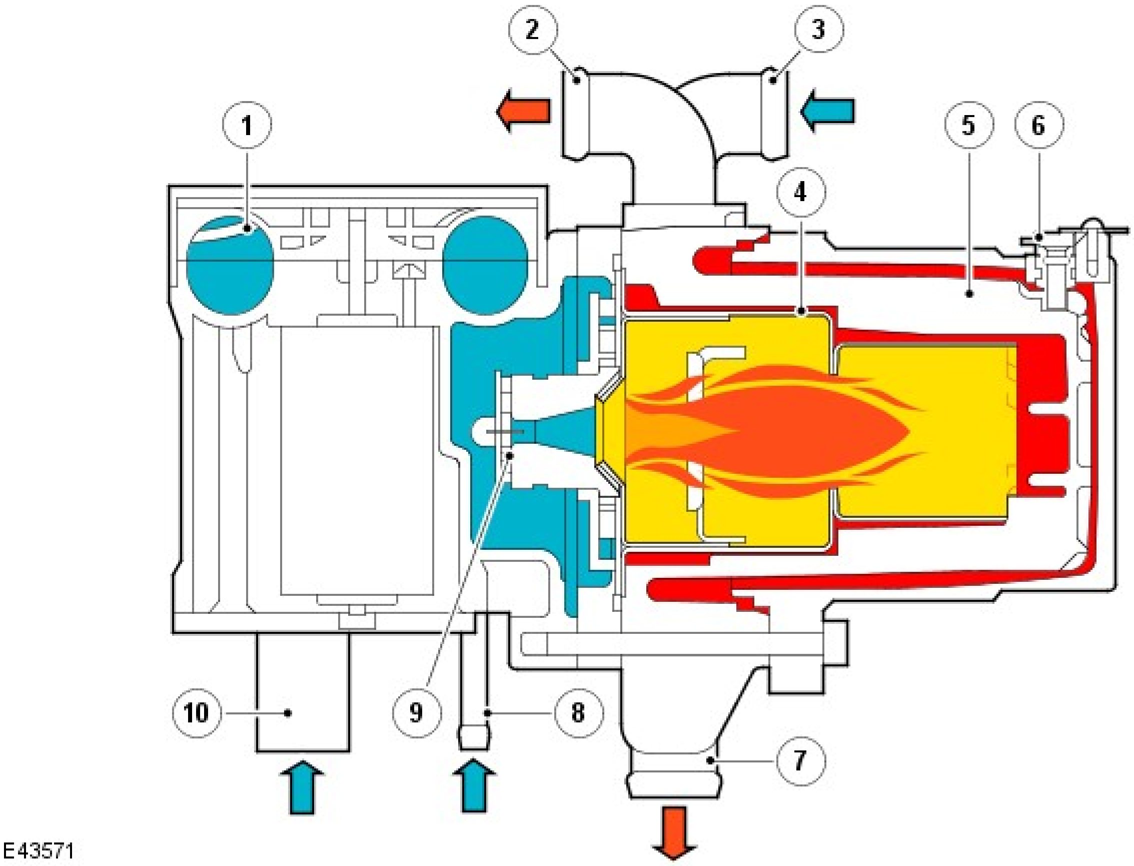
Item	Part Number	Description
1	-	Electrical connectors and control module
2	-	Air inlet muffler
3	-	Exhaust pipe
4	-	FFBH coolant outlet connection
5	-	Circulation pump coolant inlet connection
6	-	Exhaust muffler
7	-	Fuel supply line

The FFBH is installed in the coolant supply line to the heater assembly. The FFBH is located in the front left corner of the engine compartment, on two mounting brackets attached to the wheelarch. Two electrical connectors connect the FFBH to the vehicle wiring.

The FFBH unit consists of:

- A circulation pump.
- A combustion air fan.
- A burner housing.
- A heat exchanger.
- An air inlet hose and muffler.
- An exhaust pipe and muffler.
- A control module.

Sectioned View of FFBH



Item	Part Number	Description
1	-	Combustion air fan
2	-	Coolant outlet
3	-	Coolant inlet
4	-	Burner insert
5	-	Heat exchanger
6	-	Temperature sensor
7	-	Exhaust
8	-	Fuel inlet
9	-	Evaporator
10	-	Air inlet

Circulation Pump

The circulation pump is installed in the coolant inlet line of the FFBH to assist the coolant flow through the FFBH and the vehicle heater core. The circulation pump is attached to the rear mounting bracket of the FFBH.

The circulation pump runs continuously while the FFBH is active. While the FFBH is inactive, coolant flow is reliant on the engine coolant pump. Operation of the circulation pump is controlled by a power feed direct from the control module within the FFBH.

Combustion Air Fan

The combustion air fan regulates the flow of air into the FFBH to support combustion of the fuel supplied by the auxiliary fuel pump and to purge and cool the FFBH.

Burner Housing

The burner housing contains the burner insert and also incorporates connections for the exhaust pipe, the coolant inlet from the circulation pump and the coolant outlet to the vehicle heater.

The burner insert incorporates the fuel combustion chamber, an evaporator and a glow pin and flame sensor. Fuel from the auxiliary fuel pump is supplied to a venturi, where it evaporates and enters the combustion chamber to mix with air from the combustion air fan. The glow pin and flame sensor provides the ignition source of the fuel:air mixture and, once combustion is established, monitors the flame.

Heat Exchanger

The heat exchanger transfers heat generated by combustion to the coolant. Two sensors are installed in the heat exchanger casing to provide the control module with inputs of coolant temperature. The control module uses the temperature inputs to control system operation.

Air Inlet Hose and Muffler

A canister type muffler is included in the air inlet supply line. The muffler reduces the noise caused by induction roar.

Exhaust Pipe and Muffler

The exhaust pipe and muffler directs exhaust combustion gases to atmosphere below the front left corner of the engine. Exhaust vapor may be visible when the FFBH is running, depending on atmospheric conditions.

Control Module

The control module controls and monitors operation of the FFBH system. An internal flow of air from the combustion air fan ventilates the control module to prevent it overheating.

The control module is powered by a permanent feed from the battery junction box (BJB), and communicates with other systems on the vehicle over the medium speed controller area network (CAN) bus.

2	Ground	Output

Operation of the FFBH is controlled by a status message from the ATC module to the control module. A similar status message, from the control module to the ATC module, advises the ATC module of the current operating status of the FFBH.

While the engine is running, if the ambient air temperature is less than 9 °C (48 °F) and the ECT is less than 75 °C (167 °F) the ATC module changes the status message from 'heater off' to 'supplemental heat'. The control module then changes the status message it sends the ATC module to 'supplemental heat' and starts the FFBH. The control module will not start the FFBH, or will discontinue operation, if any of the following occur:

- The control module is in the error lockout mode (see **Diagnostics**, below).
- A crash message is received from the restraints control module (RCM).
  For additional information, refer to: Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) (501-20B Supplemental Restraint System, Description and Operation).
- A low fuel level message is received from the instrument cluster.
  For additional information, refer to: Instrument Cluster (413-01 Instrument Cluster, Description and Operation).
- The engine is not running, or stops running for approximately 4 seconds. The time delay is included for stall protection.

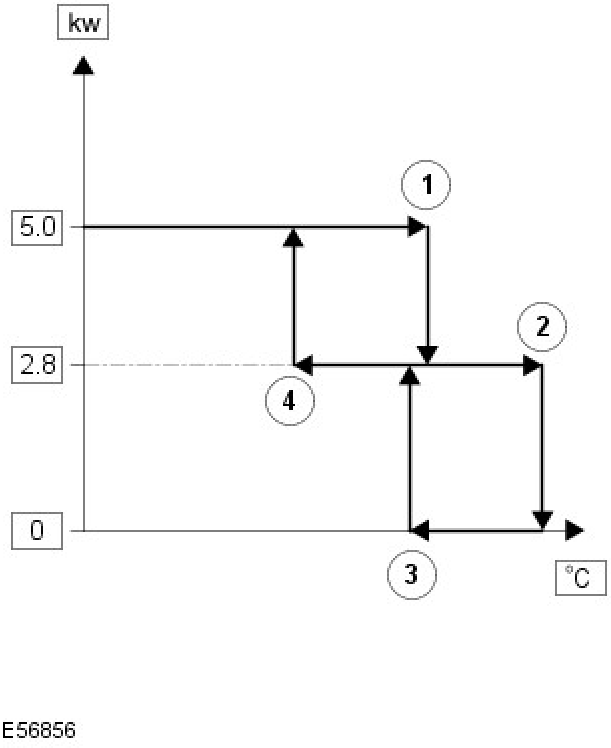
If the control module does not start the FFBH, or discontinues operation, the status message to the ATC module remains at, or changes to, 'heater off'. If the ambient air temperature increases to 9 °C (48 °F), or the ECT increases to 75 °C (167 °F), the ATC module cancels supplementary heating, by changing the status message to the control module back to 'heater off'. The control module then cancels FFBH operation and changes the status message to the ATC module to 'heater off'.

The FFBH is controlled at one of two heat output levels, 2.8 kW at part load combustion and 5 kW at full load combustion. The control module transmits the amount of fuel used by the FFBH to the instrument cluster, and the FFBH coolant temperature to the ATC module.

Start Sequence: At the beginning of a start sequence, the control module energizes the glow pin function of the glow pin and flame sensor, to pre heat the combustion chamber, starts the combustion air fan at slow speed and energizes the coolant circulation pump. After approximately 30 seconds, the control module energizes the auxiliary fuel pump at the starting sequence speed. The fuel delivered by the auxiliary fuel pump evaporates in the combustion chamber, mixes with air from the combustion air fan and is ignited by the glow pin and flame sensor. The control module then progressively increases the speed of the auxiliary fuel pump and the combustion air fan. Once combustion is established the control module switches the glow pin and flame sensor from the glow pin function to the flame sensing function to monitor combustion. From the beginning of the start sequence to stable combustion at full load takes approximately 150 seconds.

Coolant Temperature Control: While the FFBH is running, the control module cycles the FFBH between full load combustion, part load combustion and a control idle phase of operation, depending on the temperature of the coolant in the heat exchanger.

Switching Point Diagram



Switching Point Temperatures

Switching Point		Temperature, °C (°F)
Figure Item No.	Description	
1	Full load to part load	87 (188)
2	Part load to control idle	90 (194)
3	Control idle to part load	79 (174)
4	Part load to full load	76 (168)

After the start sequence, the control module maintains full load combustion until the coolant temperature reaches switching point temperature 1. At this temperature, the control module decreases the speed of the auxiliary fuel pump and the combustion air fan to half speed, to produce part load combustion. The control module maintains part load combustion while the coolant temperature remains between switching point temperatures 2 and 4. At part load combustion the temperature of the coolant will increase or decrease depending on the amount of heat required to heat the vehicle interior. If the coolant temperature decreases to switching point temperature 4, the control module increases the speed of the auxiliary fuel pump and the combustion air fan to full speed, to return to full load combustion. If the coolant temperature increases to switching point temperature 2, the control module enters a control idle phase of operation.

On entering the control idle phase, the control module immediately switches the auxiliary fuel pump off, to stop combustion, and starts a timer for the combustion air fan. After a 2 minute cool down period, the control module switches the combustion air fan off and then remains in the control idle phase while the coolant temperature remains above switching point temperature 3. If the coolant temperature decreases to switching point temperature 3, the control module initiates a start to part load combustion. A start to part load combustion takes approximately 90 seconds.

In order to limit the build up of carbon deposits on the glow pin and flame sensor, the control module also enters the control idle phase if continuous combustion time exceeds 72 minutes (at part load, full load or a combination of both). After the cool down period, if the coolant is still in the temperature range that requires additional heat, the control module restarts the FFBH.

Shutdown: To stop the FFBH, the control module de-energizes the auxiliary fuel pump to stop combustion, but continues operation of the combustion air fan and the circulation pump for a time, to cool down the FFBH. The cool down time is 100 seconds if the FFBH was operating at part load combustion and 175 seconds if the FFBH was operating at full load combustion.

Diagnostics

The control module monitors the FFBH system for faults. Any faults detected are stored in a volatile memory in the control module, which can be interrogated by T4 via the medium speed CAN bus. A maximum of three faults and associated freeze frame data can be stored at any one time. If a further fault is detected, the oldest fault is overwritten by the new fault.

The control module also incorporates an error lockout mode of operation that inhibits operation to prevent serious faults from causing further damage to the system. In the error lockout mode, the control module immediately stops the auxiliary fuel pump, and stops the combustion air fan and circulation pump after a cool down time of approximately 2 minutes. Error lockout occurs for start sequence failures, combustion flameouts, heat exchanger casing overheat and if battery voltage is out of limits. The error lockout mode can be cleared using T4, or by disconnecting the battery power supply (connector C0926) for a minimum of 10 seconds.

Start Failure and Flameout: If a start sequence fails to establish combustion, or a flameout occurs after combustion is established, the control module immediately initiates another start sequence. The start failure or flameout is also recorded by an event timer in the control module. The event timer is increased by one after each start failure or flameout, and decreased by one if a subsequent start is successful. If the event timer increases to three (over any number of drive cycles), the control module enters the error lockout mode.

Heat Exchanger Casing Overheat: To protect the system from excessive temperatures, the control module enters the error lockout mode if the heat exchanger coolant temperature exceeds 125 °C (257 °F).

Battery Voltage Limits: 10.25 - 15.5 volts.

Auxiliary Heating - Fuel Fired Booster Heater

Diagnosis and Testing

Overview

For information on the description and operation of the system, refer to section 412-02 -REFER to: (412-02B Auxiliary Heating)

> Auxiliary Heater (Description and Operation),
> Fuel Fired Booster Heater - TDV6 2.7L Diesel (Removal and Installation),
> Fuel Fired Booster Heater Glow Plug And Burner Assembly - TDV6 2.7L Diesel (Removal and Installation).

Auxiliary Heating in the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
● Fuel fired heater assembly - Combustion air fan - Coolant inlet/outlet - Heat exchanger - Temperature sensor - Exhaust - Fuel inlet - Air inlet - Evaporator ● Auxiliary fuel pump and lines ● Auxiliary coolant pump	● Fuses ● Harnesses ● Electrical connector(s) ● Controller area network (CAN) circuits ● Control module(s)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.

⚠CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Fuel Fired Booster Heater Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

DTC index

• NOTE: Where an 'on demand self-test' is referred to, this can be accessed via the 'DTC Monitor' tab on the manufacturers approved diagnostic system.

DTC	Description	Possible Causes	Action
B1A00-16	Control Module - circuit voltage below threshold	● Fuel fired booster heater module power	● Check other modules for related diagnostic trouble codes ● If other modules contain low voltage related diagnostic

DTC	Description	Possible Causes	Action
		circuit fault - Battery/charging system fault	trouble codes, suspect a common cause (battery/charging system fault) - If not, refer to the electrical circuit diagrams and check the power and ground circuits to the fuel fired booster heater module - Check for stored diagnostic trouble codes - Check for correct operation
B1A00-17	Control Module - circuit voltage above threshold	- Charging system fault - Fuel fired booster heater module failure	- Check other modules for related diagnostic trouble codes - If other modules contain high voltage related diagnostic trouble codes, suspect a common cause (battery/charging system fault) - If not, refer to the electrical circuit diagrams and check the power and ground circuits to the fuel fired booster heater module - Check for stored diagnostic trouble codes - Check for correct operation
B1A00-43	Control Module - special memory failure	- Fuel fired booster heater module failure	- Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation test) - Check for reoccurrence of the diagnostic trouble code - If the diagnostic trouble code returns - Install a new fuel fired booster heater module as required - Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
B1A00-49	Control Module - internal electronic failure	- Fuel fired booster heater module failure	- Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation test) - Check for reoccurrence of the diagnostic trouble code - If the diagnostic trouble code returns - Install a new fuel fired booster heater module as required - Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
B1D22-11	Coolant Temperature Sensor - circuit short to ground	- Fuel fired booster heater coolant temperature sensor internal fault	- Check and install a new fuel fired booster heater **coolant temperature sensor** - Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation test) - Check for stored diagnostic trouble codes - Check for correct operation
B1D22-15	Coolant Temperature Sensor - circuit short to battery or open	- Fuel fired booster heater coolant temperature sensor internal fault	- Check and install a new fuel fired booster heater **coolant temperature sensor** - Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation test) - Check for stored diagnostic trouble codes - Check for correct operation

DTC	Description	Possible Causes	Action
B1D23-13	Overheat Sensor - circuit open	- Fuel fired booster heater coolant temperature sensor internal fault	- Check and install a new fuel fired booster heater **coolant temperature sensor** - Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation test) - Check for stored diagnostic trouble codes - Check for correct operation
B1D24-11	Glow Plug - circuit short to ground	- Fuel fired booster heater glow plug internal fault	- Carry out circuit checks, inspect the glow plug cables and connector. Repair the circuit or check and install a new fuel fired booster heater **glow plug** as required REFER to: Fuel Fired Booster Heater Glow Plug And Burner Assembly - TDV6 2.7L Diesel (412-02B Auxiliary Heating, Removal and Installation). - Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation test) - Check for stored diagnostic trouble codes - Check for correct operation
B1D24-15	Glow Plug - circuit short to battery or open	- Fuel fired booster heater glow plug internal fault	- Carry out circuit checks, inspect the glow plug cables and connector. Repair the circuit or check and install a new fuel fired booster heater **glow plug** as required REFER to: Fuel Fired Booster Heater Glow Plug And Burner Assembly - TDV6 2.7L Diesel (412-02B Auxiliary Heating, Removal and Installation). - Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation test) - Check for stored diagnostic trouble codes - Check for correct operation
B1D25-11	Heater Fuel Pump - circuit short to ground	- Heater fuel pump circuit short to ground - Heater fuel pump failure	- Refer to the electrical circuit diagrams and check the fuel fired booster heater fuel pump and circuit for short to ground - Repair the circuit or check and install a new fuel fired booster heater **fuel pump** as required - Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation test) - Check for stored diagnostic trouble codes - Check for correct operation
B1D25-15	Heater Fuel Pump - circuit short to battery or open	- Heater fuel pump circuit short to power, open circuit - Heater fuel pump failure	- Refer to the electrical circuit diagrams and check the fuel fired booster heater fuel pump and circuit for short to power, open circuit - Repair the circuit or check and install a new fuel fired booster heater **fuel pump** as required - Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation test) - Check for stored diagnostic trouble codes - Check for correct operation
B1D26-11	Combustion Air Blower - circuit short to ground	- Fuel fired booster heater module failure	- Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation

DTC	Description	Possible Causes	Action
			test) - If the diagnostic trouble code reoccurs check and install a new fuel fired booster heater module - Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
B1D26-15	Combustion Air Blower - circuit short to battery or open	- Fuel fired booster heater module failure	- Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation test) - If the diagnostic trouble code reoccurs check and install a new fuel fired booster heater module - Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
B1D26-92	Combustion Air Blower - performance or incorrect operation	- Fuel fired booster heater module failure	- Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation test) - Check for reoccurrence of the diagnostic trouble code - If the diagnostic trouble code reoccurs check and install a new fuel fired booster heater module - Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
B1D26-93	Combustion Air Blower - no operation	- Fuel fired booster heater module failure	- Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation test) - Check for reoccurrence of the diagnostic trouble code - If the diagnostic trouble code reoccurs check and install a new fuel fired booster heater module - Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
B1D27-11	Heater Coolant Pump - circuit short to ground	- Heater coolant pump circuit short to ground - Heater coolant pump failure	- Refer to the electrical circuit diagrams and check the fuel fired booster heater water pump and circuit for short to ground - Repair the circuit or check and install a new fuel fired booster heater **water pump** as required - Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation test) - Check for stored diagnostic trouble codes - Check for correct operation
B1D27-15	Heater Coolant Pump - circuit short to battery or open	- Heater coolant pump circuit short to power, open circuit - Heater coolant pump failure	- Refer to the electrical circuit diagrams and check the fuel fired booster heater water pump and circuit for short to power, open circuit - Repair the circuit or check and install a new fuel fired booster heater **water pump** as required - Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation

DTC	Description	Possible Causes	Action
			test) - Check for stored diagnostic trouble codes - Check for correct operation
B1D29-93	No Start, Even After Restart Attempt - no operation	- No fuel present at fuel fired booster heater module - Exhaust system blocked - Air intake blocked	- Check vehicle fuel level - Check fuel lines to fuel fired booster heater module for blockage, kinking or damage - Check exhaust system and air intake for blockage, kinking or damage - Check fuel for aeration and correct fuel delivery - Check vehicle is not parked on an incline when parking heater is operated - Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation test) - Check for stored diagnostic trouble codes - Check for correct operation
B1D30-93	No Start In Test Mode - no operation	- No fuel present at fuel fired booster heater module - Exhaust system blocked - Air intake blocked	- Check vehicle fuel level - Check fuel lines to fuel fired booster heater module for blockage, kinking or damage - Check exhaust system and air intake for blockage, kinking or damage - Check fuel for aeration and correct fuel delivery - Check vehicle is not parked on an incline when parking heater is operated - Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation test) - Check for stored diagnostic trouble codes - Check for correct operation
B1D31-94	Flame Detected Prior to Normal Operation - unexpected operation	• NOTE: The glow plug and flame sensor are a combined unit - Glow plug circuit fault	- Check exhaust system and air intake for blockage, kinking or damage - Carry out circuit checks, inspect the glow plug cables and connector. Repair the circuit or check and install a new fuel fired booster heater glow plug as required REFER to: Fuel Fired Booster Heater Glow Plug And Burner Assembly - TDV6 2.7L Diesel (412-02B Auxiliary Heating, Removal and Installation). - Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation test) - Check for stored diagnostic trouble codes - Check for correct operation
B1D32-92	Multiple Flame Interruption During Heating Cycle - performance or incorrect operation	- No fuel present at fuel fired booster heater module - Exhaust system blocked - Air intake blocked	- Check vehicle fuel level - Check fuel lines to Fuel fired booster heater module for blockage, kinking or damage - Check exhaust system and air intake for blockage, kinking or damage - Check fuel for aeration and correct fuel delivery - Check vehicle is not parked on an incline when parking heater is operated - Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation test) - Check for stored diagnostic trouble codes - Check for correct operation

DTC	Description	Possible Causes	Action
B1D33-92	Flame Interruption During Normal Operation - performance or incorrect operation	- No fuel present at fuel fired booster heater module - Exhaust system blocked - Air intake blocked	- Check vehicle fuel level - Check fuel lines to fuel fired booster heater module for blockage, kinking or damage - Check exhaust system and air intake for blockage, kinking or damage - Check fuel for aeration and correct fuel delivery - Check vehicle is not parked on an incline when parking heater is operated - Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation test) - Check for stored diagnostic trouble codes - Check for correct operation
B1D34-68	Heater In Lock Out Mode - event information	- Fuel fired booster heater system fault	• NOTE: For information only, rectify other stored fuel fired booster heater diagnostic trouble codes prior to this diagnostic trouble code - Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation test** (Setup and configuration/auxiliary heater/operation test) - Check for stored diagnostic trouble codes - Check for correct operation
U0073-08	Vehicle Communication Bus A - Bus Signal / Message Failures	- Medium speed CAN communication bus off - Fuel fired booster heater module failure	- Using the manufacturer approved diagnostic system, complete a CAN network integrity test
U0164-87	Lost Communication With HVAC Control Module - Missing message	- CAN bus circuit fault - Module internal fault	- Check other modules for related diagnostic trouble codes - Using the manufacturer approved diagnostic system, complete a CAN network integrity test
U1A00-08	Private Bus Circuit	• NOTE: Telestart vehicles only - Signal/Message failure/error occurred in W-Bus communication	Refer to the electrical circuit diagrams and check the circuit between the fuel fired booster heater module and the fuel fired booster heater receiver
U1A03-95	Car Config Parameter - Incorrect assembly	- Fuel fired booster heater module not configured or incorrectly configured	- Re-configure the fuel fired booster heater module using the manufacturer approved diagnostic system (Module programming/Configure existing module/Auxiliary heater control module)
U1A37-87	Crash Status Telegram Bus Signal / Message Failures Missing message	- Crash signal received over CAN network	• NOTE: Event information - the restraints control module has recorded a crash event - Using the manufacturer approved diagnostic system, check other modules for related diagnostic trouble codes
U1A44-6C	Low fuel warning	- Fuel level below threshold	- Auxiliary heater has used the low fuel warning lamp signal CAN message, to turn itself off, and save the remaining fuel for the engine - After the fuel tank is refilled, and the warning lamp goes off, it will operate as normal - Advise customer of this feature, and recommend that they keep the fuel level higher, to ensure auxiliary heater stays on
U3000-55	Control Module - Not configured	- Fuel fired booster heater module not configured or	- Using the manufacturer approved diagnostic system, record then clear any stored diagnostic trouble codes then conduct the fuel fired booster heater **operation**

DTC	Description	Possible Causes	Action
		incorrectly configured ● Central junction box not configured correctly	**test** (Setup and configuration/auxiliary heater/operation test) ● Check for reoccurrence of the diagnostic trouble code ● If the diagnostic trouble code returns ● Using the manufacturer approved diagnostic system check and up-date the car configuration file as required ● Re-configure the fuel fired booster heater module using the manufacturer approved diagnostic system ● Check for stored diagnostic trouble codes ● Check for correct operation

For a complete list of all Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.
REFER to: Diagnostic Trouble Code (DTC) Index (100-00, Description and Operation).

Auxiliary Heating - Fuel Fired Booster HeaterTDV8 3.6L Diesel

Removal and Installation

Removal

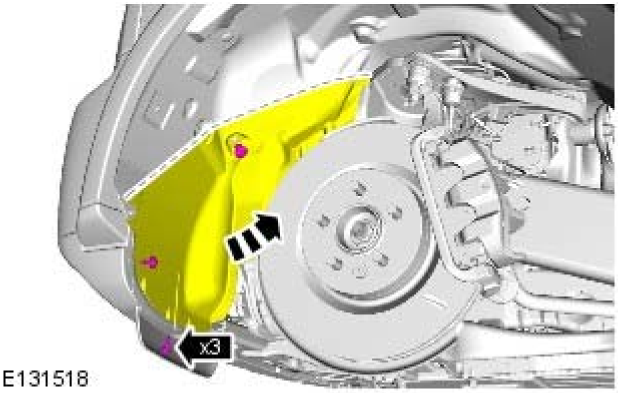
- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Raise and support the vehicle.

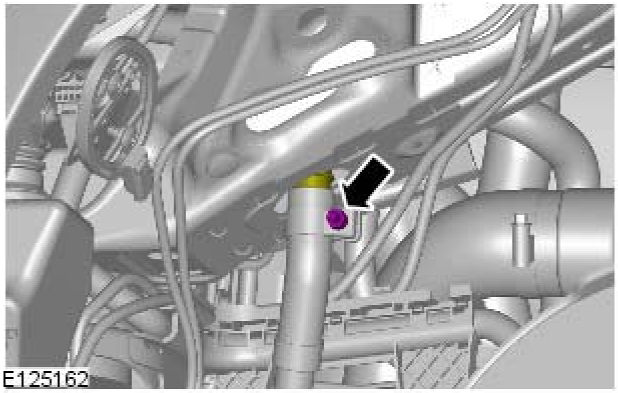
3. NOTE: Wheel shown removed for clarity.

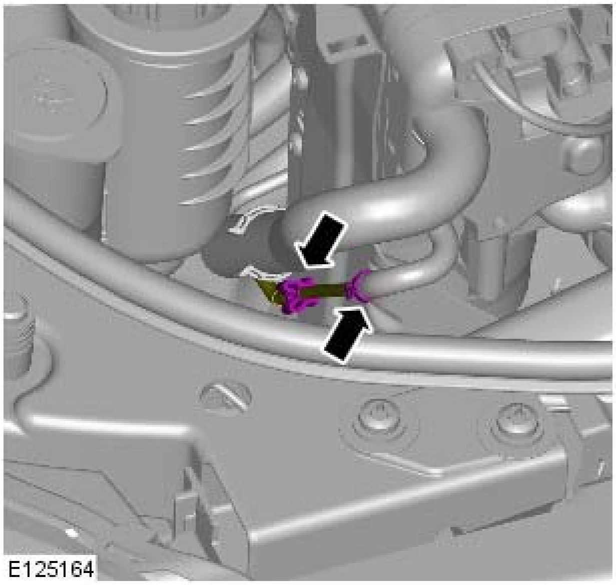
Carefully release the wheel arch liner, to allow access to the fuel fired burner heater (FFBH) exhaust clamp retaining bolt.



4. NOTE: Components removed for clarity.

Release the exhaust clamp.





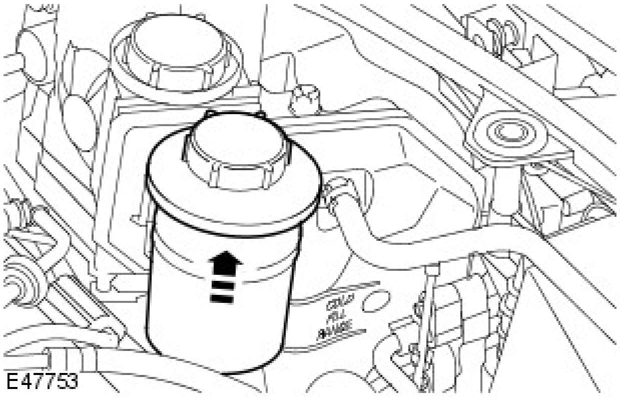
5. ⚠ CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the fuel fired booster heater fuel line.

- Release the clip.

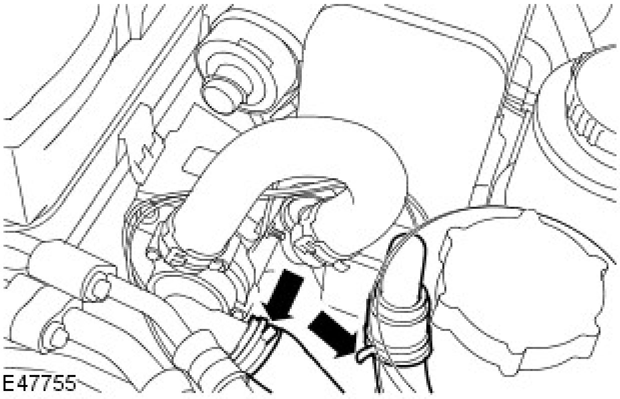
6. Lower the vehicle.

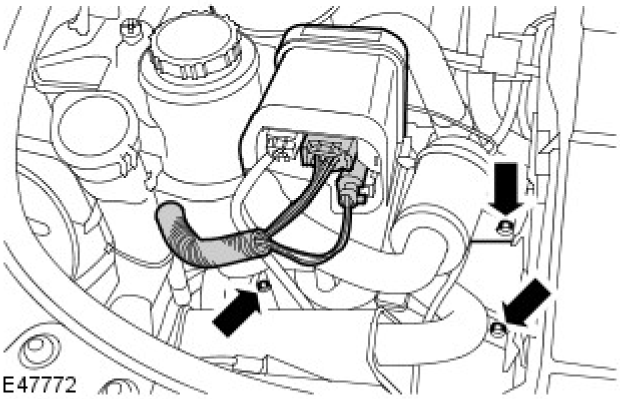
7. Release the power steering fluid reservoir.



8. Disconnect the fuel fired booster heater inlet and outlet coolant hoses.

- Clamp the hoses to minimise coolant loss.
- Release the 2 clips.





9. Remove the fuel fired booster heater.

- Disconnect the 2 electrical connectors.
- Remove the 3 bolts.
- Release the fuel pipe from the clip.

Installation

1. Install the fuel fired booster heater.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Connect the electrical connectors.
- Secure the fuel pipe in the clip.

2. Connect the fuel fired booster heater coolant hoses.

- Secure with the clips.
- Remove the clamps.

3. Connect the fuel fired booster heater fuel hose.

- Secure with the clip.

4. Raise the vehicle.

5. Tighten the exhaust clamp.

- Tighten to 10 Nm (7 lb.ft).

6. Secure the wheel arch liner.

- Install the two retaining screws.
- Install the clip.

7. Lower the vehicle.

8. Install the power steering fluid reservoir.

9. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

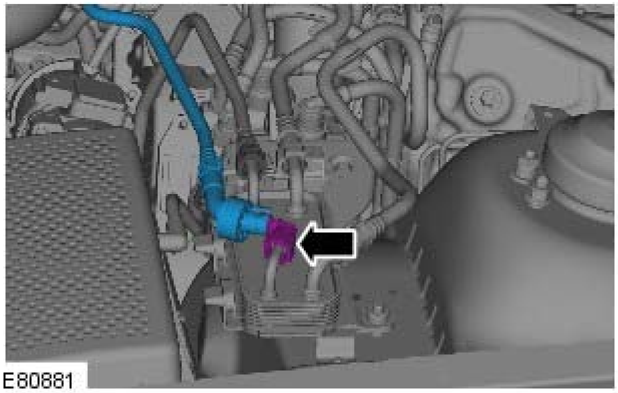
10. Connect exhaust extraction hoses to the tail pipes.

11. ⚠CAUTION: Anti-freeze concentration must be maintained at 50%.

Fill the cooling system expansion tank until the coolant level becomes static with in the "COLD FILL RANGE".

12. ⚠CAUTION: Make sure the coolant level remains above the "COLD FILL RANGE" lower level mark.

Start the engine and allow to idle.



13. WARNING: Eye protection must be worn.

- CAUTIONS:

Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

Since injury such as scalding could be caused by escaping steam or coolant, make sure the vehicle cooling system is cool prior to carrying out this procedure

Disconnect the fuel cooler coolant return line.

- Allow any trapped air to escape.

14. Connect the fuel cooler coolant return line.

15. When coolant runs from the expansion tank bleed point bubble-free, tighten the bleed screw.

16. Add coolant to the expansion tank until the coolant level is 25 mm (0.98 inch) above the "COLD FILL RANGE" upper mark.

17. Hold the engine speed at 2,000 RPM for 25 seconds.

18. Allow the engine to idle for 30 seconds.

19. CAUTIONS:

Observe the engine temperature gauge. If the engine starts to over-heat switch off immediately and allow to cool. Failure to follow this instruction may cause damage to the vehicle

Make sure the coolant level remains above the "COLD FILL RANGE" lower level mark.

Repeat the above 2 steps 3 times or until hot air is emitted from the heater.

20. Allow the engine to idle for 30 seconds.

21. Add coolant to the expansion tank until the coolant level is 25 mm (0.98 inch) above the "COLD FILL RANGE" upper mark.

- Install the coolant expansion tank cap.

22. CAUTION: Observe the engine temperature gauge. If the engine starts to over-heat switch off immediately and allow to cool. Failure to follow this instruction may cause damage to the vehicle

Start and run the engine until the thermostat opens.

- Switch the engine off and allow to cool.

23. WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

CAUTION: If topping up the cooling system when HOT, the HOT fill level with the coolant expansion tank cap removed is significantly higher, 50 mm (2 inches) than the COLD fill level. Failure to compensate for this may lead to significant under filling of the cooling system and may lead to incorrect diagnosis and coolant loss.

Check and top-up the coolant if required.

Removal and Installation

Removal

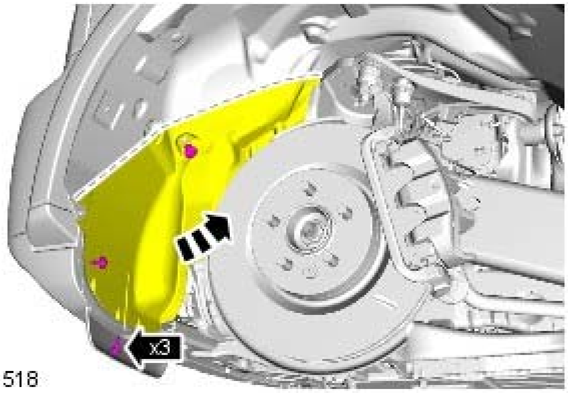
- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

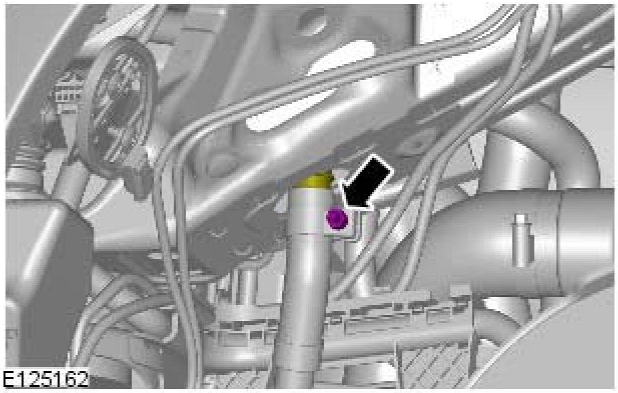
3. NOTE: Wheel shown removed for clarity.



E131518

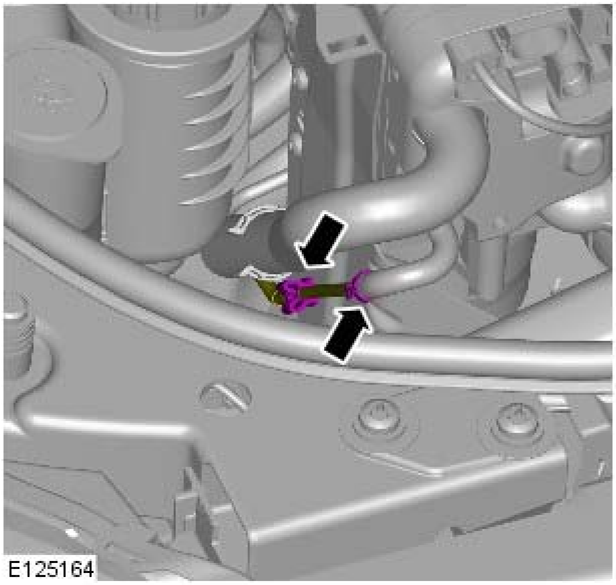
Carefully release the wheel arch liner, to allow access to the fuel fired burner heater (FFBH) exhaust clamp retaining bolt.

4. NOTE: Components removed for clarity.



E125162

Release the exhaust clamp.



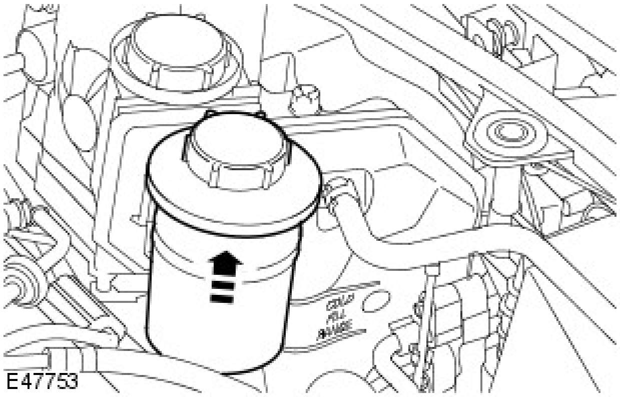
5. ⚠ CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the fuel fired booster heater fuel line.

- Release the clip.

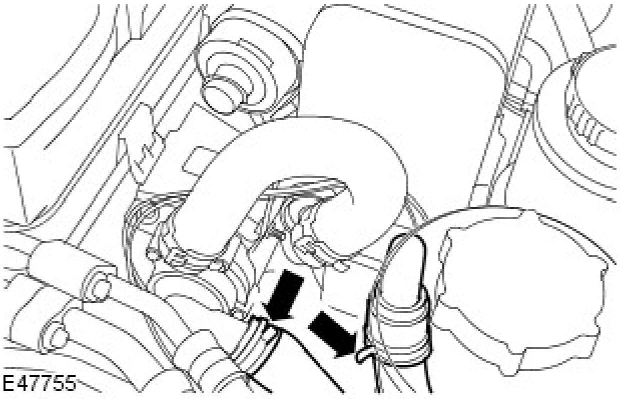
6. Lower the vehicle.

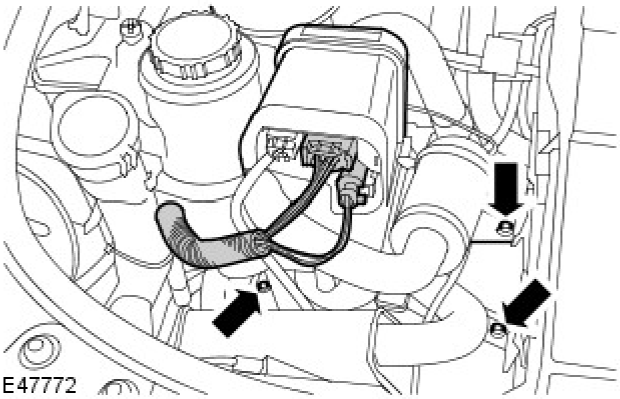
7. Release the power steering fluid reservoir.



8. Disconnect the fuel fired booster heater inlet and outlet coolant hoses.

- Clamp the hoses to minimise coolant loss.
- Release the 2 clips.





9. Remove the fuel fired booster heater.

- Disconnect the 2 electrical connectors.
- Remove the 3 bolts.
- Release the fuel pipe from the clip.

Installation

1. Install the fuel fired booster heater.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Connect the electrical connectors.
- Secure the fuel pipe in the clip.

2. Connect the fuel fired booster heater coolant hoses.

- Secure with the clips.
- Remove the clamps.

3. Connect the fuel fired booster heater fuel hose.

- Secure with the clip.

4. Raise the vehicle.

5. Tighten the exhaust clamp.

- Tighten to 10 Nm (7 lb.ft).

6. Secure the wheel arch liner.

- Install the two retaining screws.
- Install the clip.

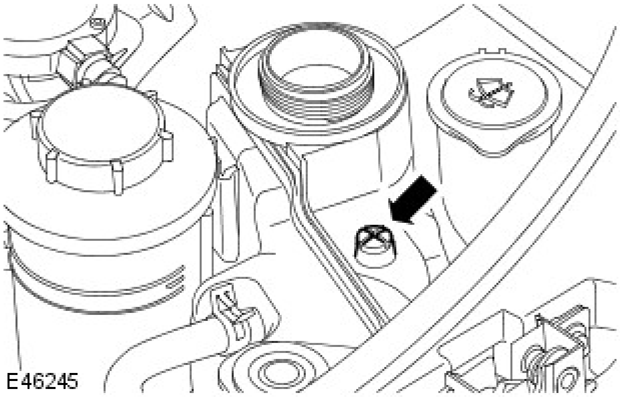
7. Lower the vehicle.

8. Install the power steering fluid reservoir.

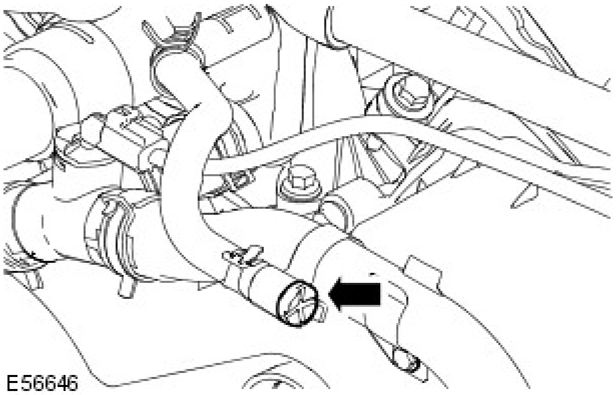
9. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

10. Connect exhaust extraction hoses to the tail pipes.

11. Remove the engine cover.
For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).



12. Loosen the coolant expansion tank bleed screw.



13. Loosen the cylinder head bleed hose bleed screw.

14. Refill the cooling system.

15. Tighten the bleed screws to 14 Nm (10 lb.ft).

16. Fill the cooling system, keeping coolant to the upper level mark of the expansion tank, until a steady stream of coolant is seen returning to the tank.

17. NOTE: When the coolant bleed is complete and prior to installing the expansion tank cap, top up the expansion tank to 30mm above the maximum level.

Install the coolant expansion tank cap.

18. ⚠ WARNING: Release the cooling system pressure by slowly turning the expansion tank cap a quarter of a turn. Cover the expansion tank cap with a thick cloth to prevent the possibility of scalding. Failure to follow this instruction may result in personal injury.

Start and run the engine.

- Hold the engine speed at 3,000 RPM for one minute.
- Return the engine to idle for five minutes.
- Hold the engine speed at 3,000 RPM for one minute.
- Run the engine until the thermostat opens.
- Remove coolant expansion tank cap, allow float to settle and top-up coolant if required. Install cap.

19. Switch the engine off and allow to cool.

20. Install the engine cover.
For additional information, refer to: Engine Cover - TDV6 2.7L

Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

Lubricant

Item	Specification
Compressor oil	Denso ND-8 PAG oil
Total system capacity	130 cm³ (4.5 fluid ounces)
Additional amount of oil to be added to system if a component is replaced:	
Condenser	40 cm³ (1.4 fluid ounces)
Evaporator	40 cm³ (1.4 fluid ounces)
Pipe or hose	10 cm³ (0.35 fluid ounces)

System Refrigerant Specification / Capacity

Item	Specification
Refrigerant type	R134A
Total system capacity	600 grammes (21.16 ounces)

General Specification

Item	Description
Compressor:	
Make	Denso
Type	7SEU17
Sensor locations:	
Ambient temperature sensor	At the front of the vehicle
Smog sensor	At the front of the vehicle adjacent to the ambient temperature sensor
ICS/humidity sensor	On the instrument panel adjacent to the steering column
Solar sensor	On the vehicle centre line on top of the instrument panel
Pressure transducer	In A/C line - LH side of engine compartment

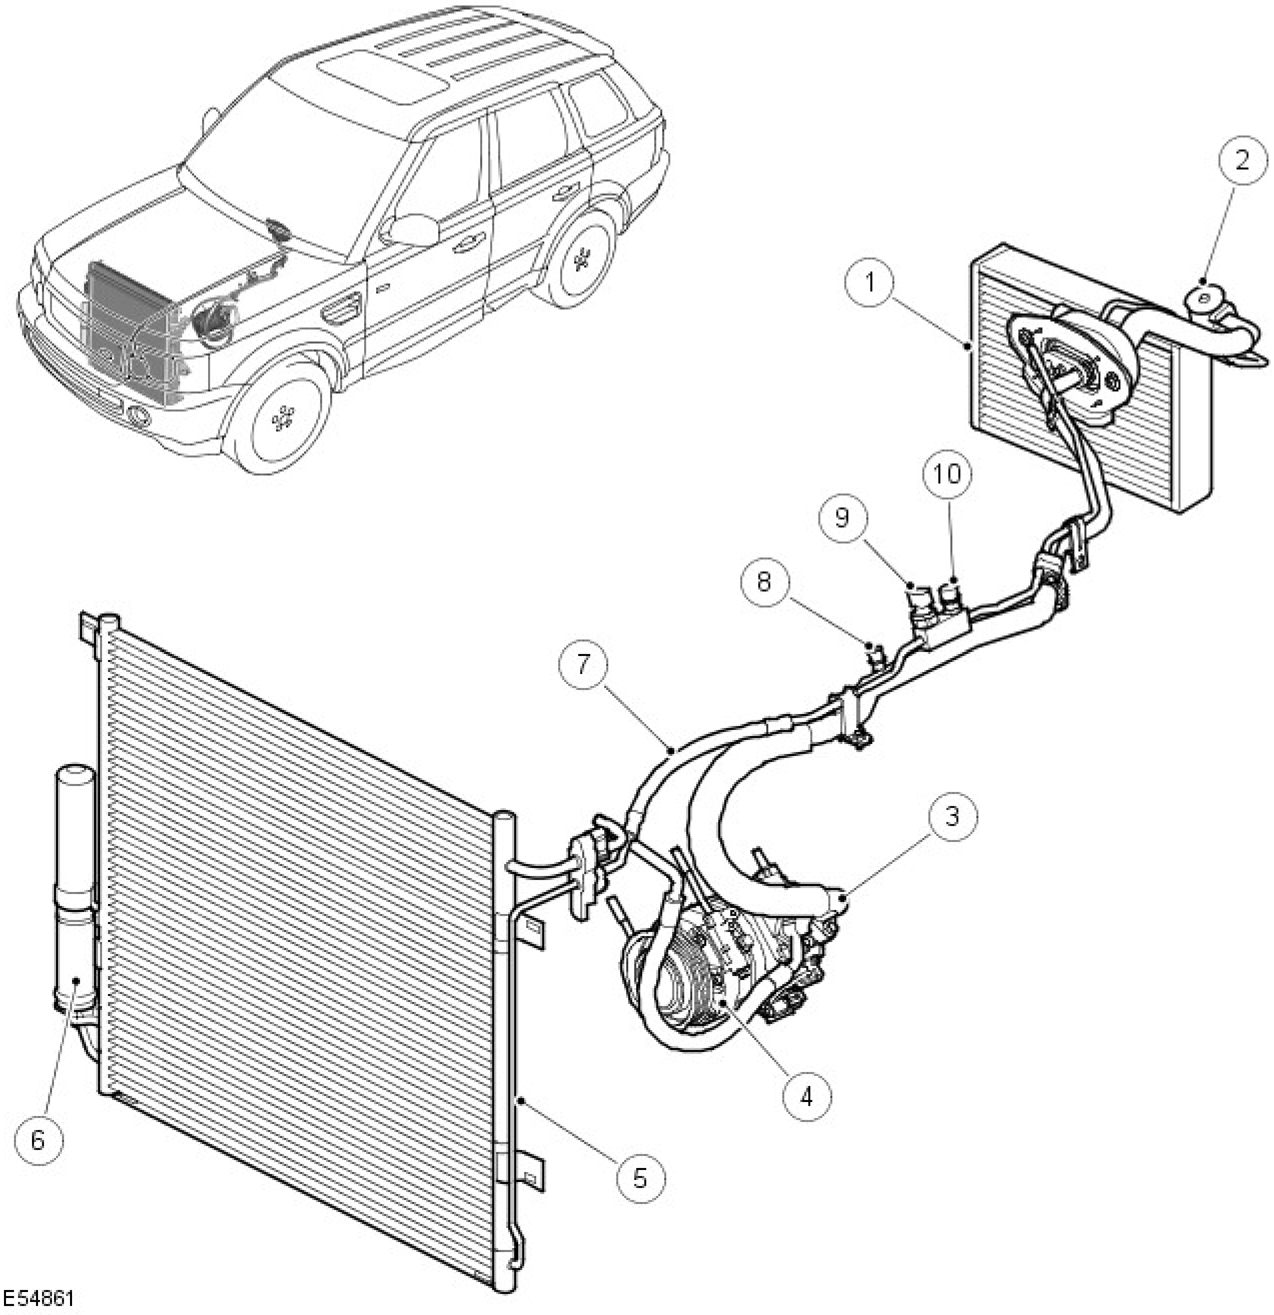
Air Conditioning - V8 S/C 4.2L Petrol - Air Conditioning

Description and Operation

COMPONENT LOCATIONS



Item	Part Number	Description
1	-	Evaporator
2	-	Thermostatic expansion valve
3	-	Low pressure line
4	-	air conditioning (A/C) compressor
5	-	Condenser
6	-	Receiver drier
7	-	High pressure line
8	-	Low pressure servicing connection
9	-	Refrigerant pressure sensor (reference)
10	-	High pressure servicing connection

GENERAL

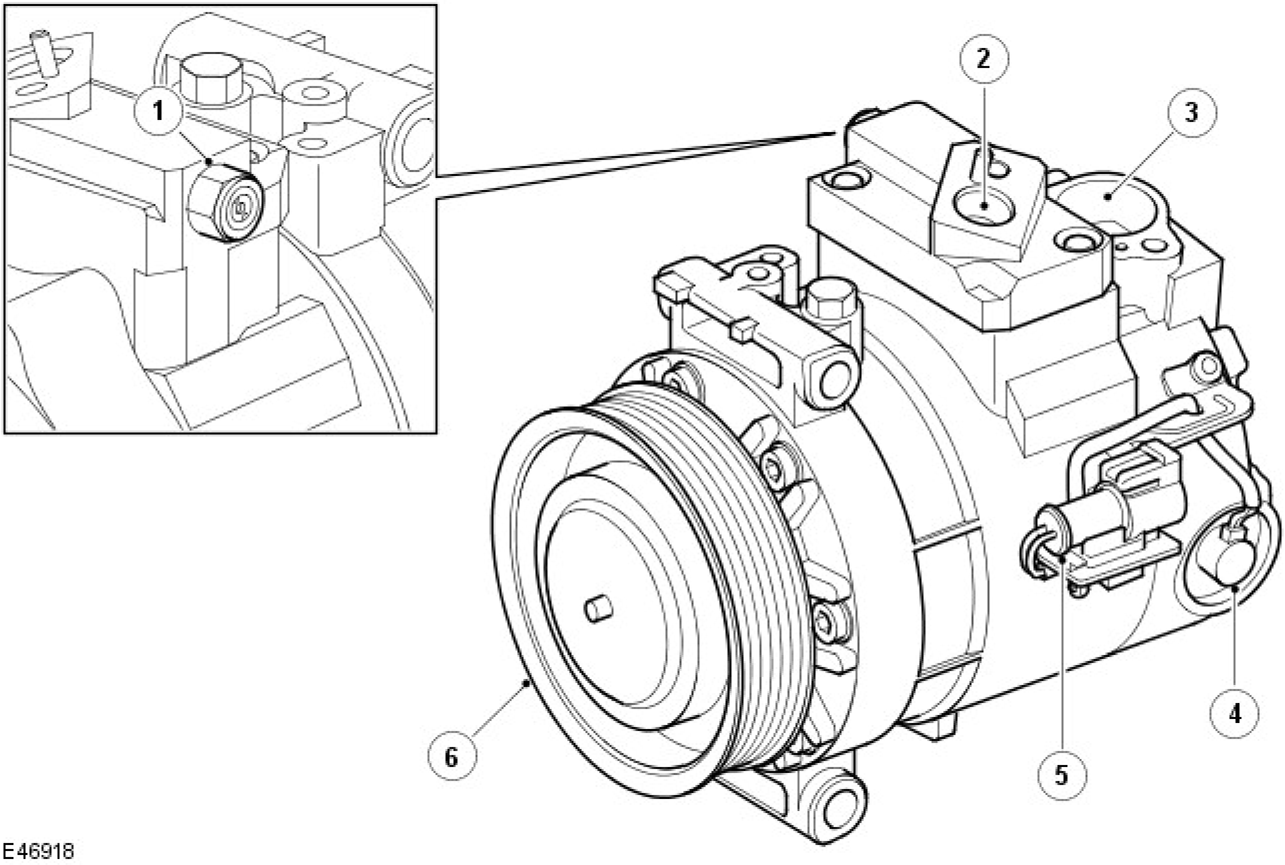
The A/C system transfers heat from the vehicle interior to the outside atmosphere to provide the heater assembly with dehumidified cool air. The system consists of:

- A compressor.
- A condenser.
- A receiver drier.
- A thermostatic expansion valve.
- An evaporator.
- Low and high pressure refrigerant lines.

The system is a sealed, closed loop, filled with a charge weight of R134a refrigerant as the heat transfer medium. Oil is added to the refrigerant to lubricate the internal components of the compressor.

Operation of the air conditioning system is controlled by the automatic temperature control (ATC) module.
For additional information, refer to: Control Components (412-04 Control Components, Description and Operation).

A/C COMPRESSOR

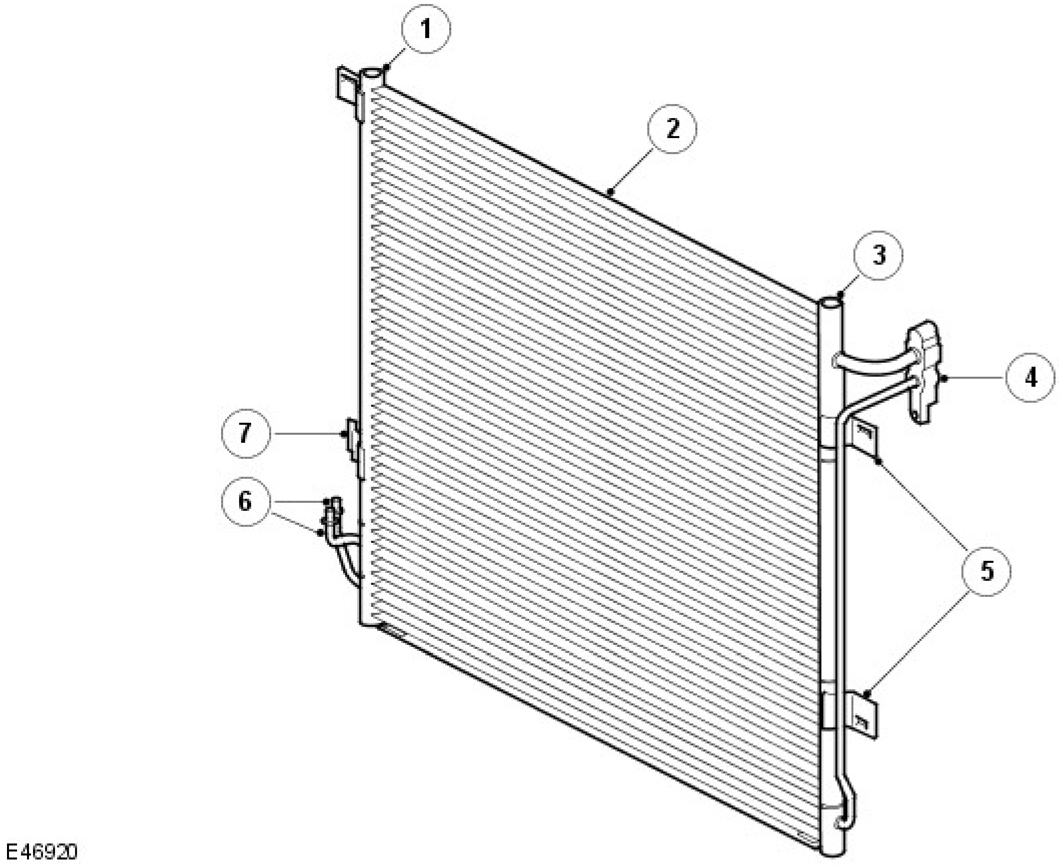


Item	Part Number	Description
1	-	Pressure relief valve
2	-	Outlet port
3	-	Inlet port
4	-	Solenoid valve
5	-	Electrical connector
6	-	Pulley

The A/C compressor circulates the refrigerant around the system by compressing low pressure, low temperature vapor from the evaporator and discharging the resultant high pressure, high temperature vapor to the condenser. The A/C compressors for the different engine types differ due to their individual installation requirements, but are otherwise the same.

The A/C compressor is a permanently engaged, variable displacement unit which is driven by the engine accessory drive belt. To protect the refrigerant system from excessive pressure, a pressure relief valve is installed in the outlet side of the A/C compressor. The pressure relief valve vents excess pressure into the engine compartment.

CONDENSER

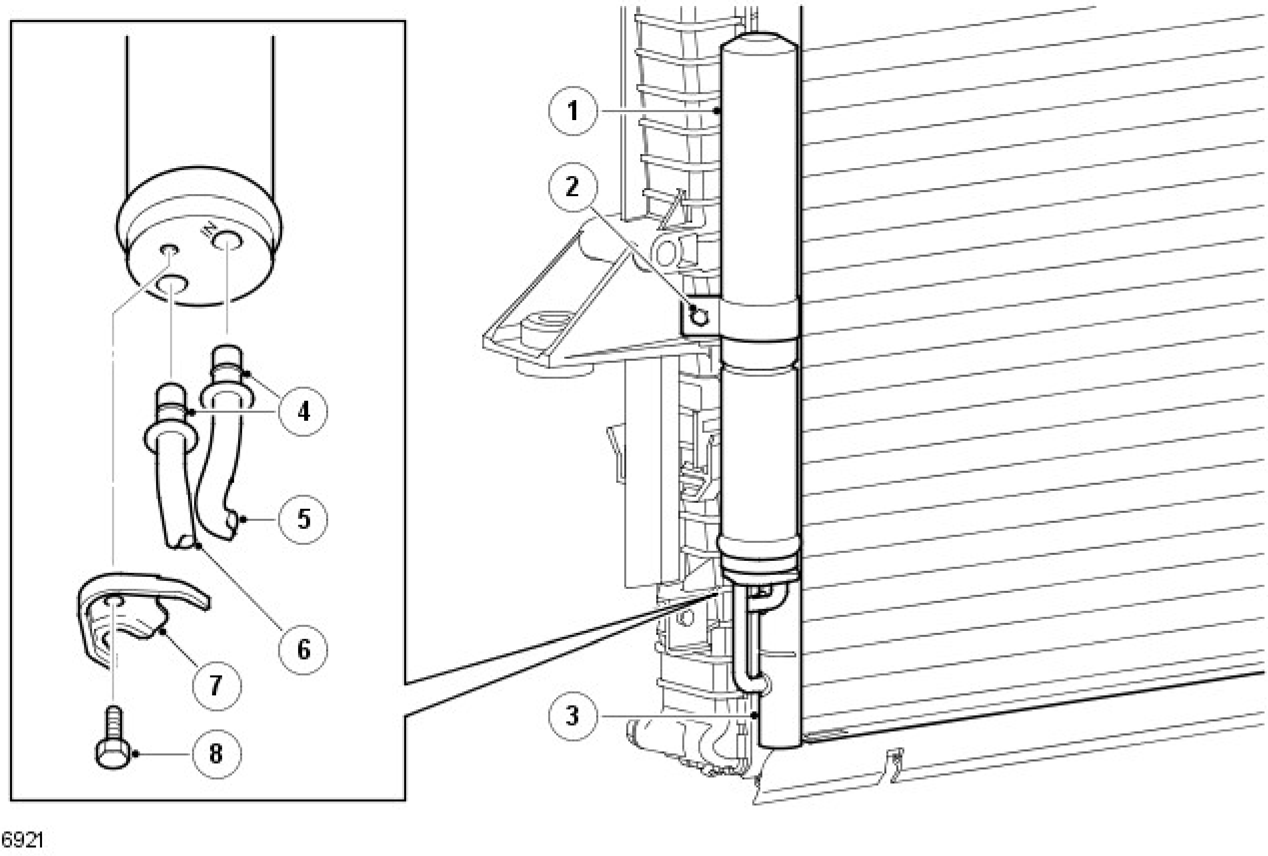


Item	Part Number	Description
1	-	right-hand (RH) end tank
2	-	Condenser core
3	-	left-hand (LH) end tank
4	-	High pressure line connector block
5	-	Condenser attachment brackets
6	-	Receiver drier pipes
7	-	Receiver drier attachment bracket

The condenser transfers heat from the refrigerant to the surrounding air to convert the high pressure vapor from the compressor into a liquid. The condenser is installed immediately in front of the radiator. Two brackets on each end tank of the condenser attach the condenser to clips on the end tanks of the radiator.

The condenser is classified as a sub-cooling condenser and consists of a fin and tube heat exchanger core installed between two end tanks. Divisions in the end tanks separate the heat exchanger into a four pass upper (condenser) section and a two pass lower (sub-cooler) section. A connector block on the left end tank of the condenser provides connections for the high pressure lines from the A/C compressor and the evaporator. Two pipes at the bottom of the right end tank of the condenser provide connections for the receiver drier.

RECEIVER DRIER



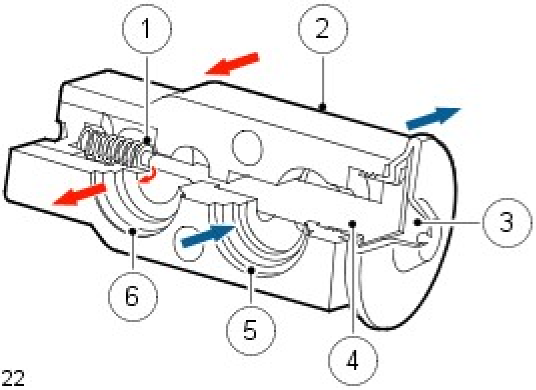
Item	Part Number	Description
1	-	Receiver drier
2	-	Clamp
3	-	Condenser RH end tank
4	-	O-ring seals
5	-	Inlet pipe
6	-	Outlet pipe
7	-	Collar
8	-	Bolt

The receiver drier removes solid impurities and moisture from the refrigerant, and provides a reservoir for liquid refrigerant to accommodate changes of heat load at the evaporator.

The receiver drier is attached to the two stub pipes on the right end tank of the condenser. A collar, located on lands on the stub pipes and secured with a bolt, attaches the stub pipes to the receiver drier. A clamp secures the body of the receiver drier to a bracket welded to the right end tank of the condenser. The inlet and outlet ports of the receiver drier are the same size, so care must be taken to install the receiver drier the correct way round on the stub pipes; to assist with installation, the inlet port is identified with the word IN etched into the receiver drier.

Refrigerant entering the receiver drier passes through a filter and a desiccant pack, then collects in the base of the unit before flowing through the outlet stub pipe back to the condenser. The desiccant and the filter are non-serviceable; the complete unit must be replaced when a change of desiccant is required.

THERMOSTATIC EXPANSION VALVE



E46922

Item	Part Number	Description
1	-	Metering valve
2	-	Housing
3	-	Diaphragm
4	-	Temperature sensitive tube
5	-	Outlet passage from evaporator
6	-	Inlet passage to evaporator

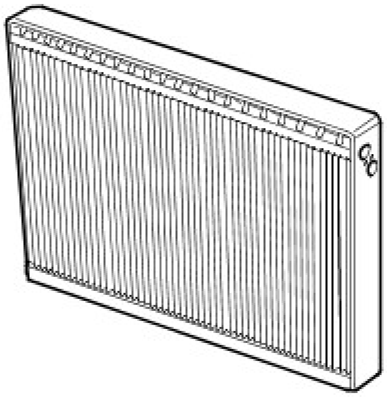
The thermostatic expansion valve meters the flow of refrigerant into the evaporator, to match the refrigerant flow with the heat load of the air passing through the evaporator.

The thermostatic expansion valve is a block type valve located behind the heater assembly, and attached to the inlet and outlet ports of the evaporator. The thermostatic expansion valve consists of an aluminum housing containing inlet and outlet passages. A ball and spring metering valve is installed in the inlet passage and a temperature sensor is installed in the outlet passage. The temperature sensor consists of a temperature sensitive tube connected to a diaphragm. The bottom end of the temperature sensitive tube acts on the ball of the metering valve. Pressure on top of the diaphragm is controlled by evaporator outlet temperature conducted through the temperature sensitive tube. The bottom of the diaphragm senses evaporator outlet pressure.

Liquid refrigerant flows through the metering valve into the evaporator. The restriction across the metering valve reduces the pressure and temperature of the refrigerant. The restriction also changes the liquid stream of refrigerant into a fine spray, to improve the evaporation process. As the refrigerant passes through the evaporator, it absorbs heat from the air flowing through the evaporator. The increase in temperature causes the refrigerant to vaporize and increase in pressure.

The temperature and pressure of the refrigerant leaving the evaporator act on the diaphragm and temperature sensitive tube, which regulate the metering valve opening and so control the volume of refrigerant flowing through the evaporator. The warmer the air flowing through the evaporator, the more heat available to evaporate refrigerant and thus the greater the volume of refrigerant allowed through the metering valve.

EVAPORATOR



E46923

The evaporator is installed in the heater assembly between the blower and the heater matrix, to absorb heat from the exterior or recirculated air. Low pressure, low temperature refrigerant changes from liquid to vapor in the evaporator, absorbing large quantities of heat as it changes state.

Most of the moisture in the air passing through the evaporator condenses into water, which drains out of the heater and through the floorpan, to the underside of the vehicle, through two drain tubes.

REFRIGERANT LINES

To maintain similar flow velocities around the system, the diameter of the refrigerant lines varies to suit the two pressure/temperature regimes. The larger diameters are installed in the low pressure/temperature regime and the smaller diameters are installed in the high pressure/temperature regime.

Low and high pressure charging connections are incorporated into the refrigerant lines for system servicing.

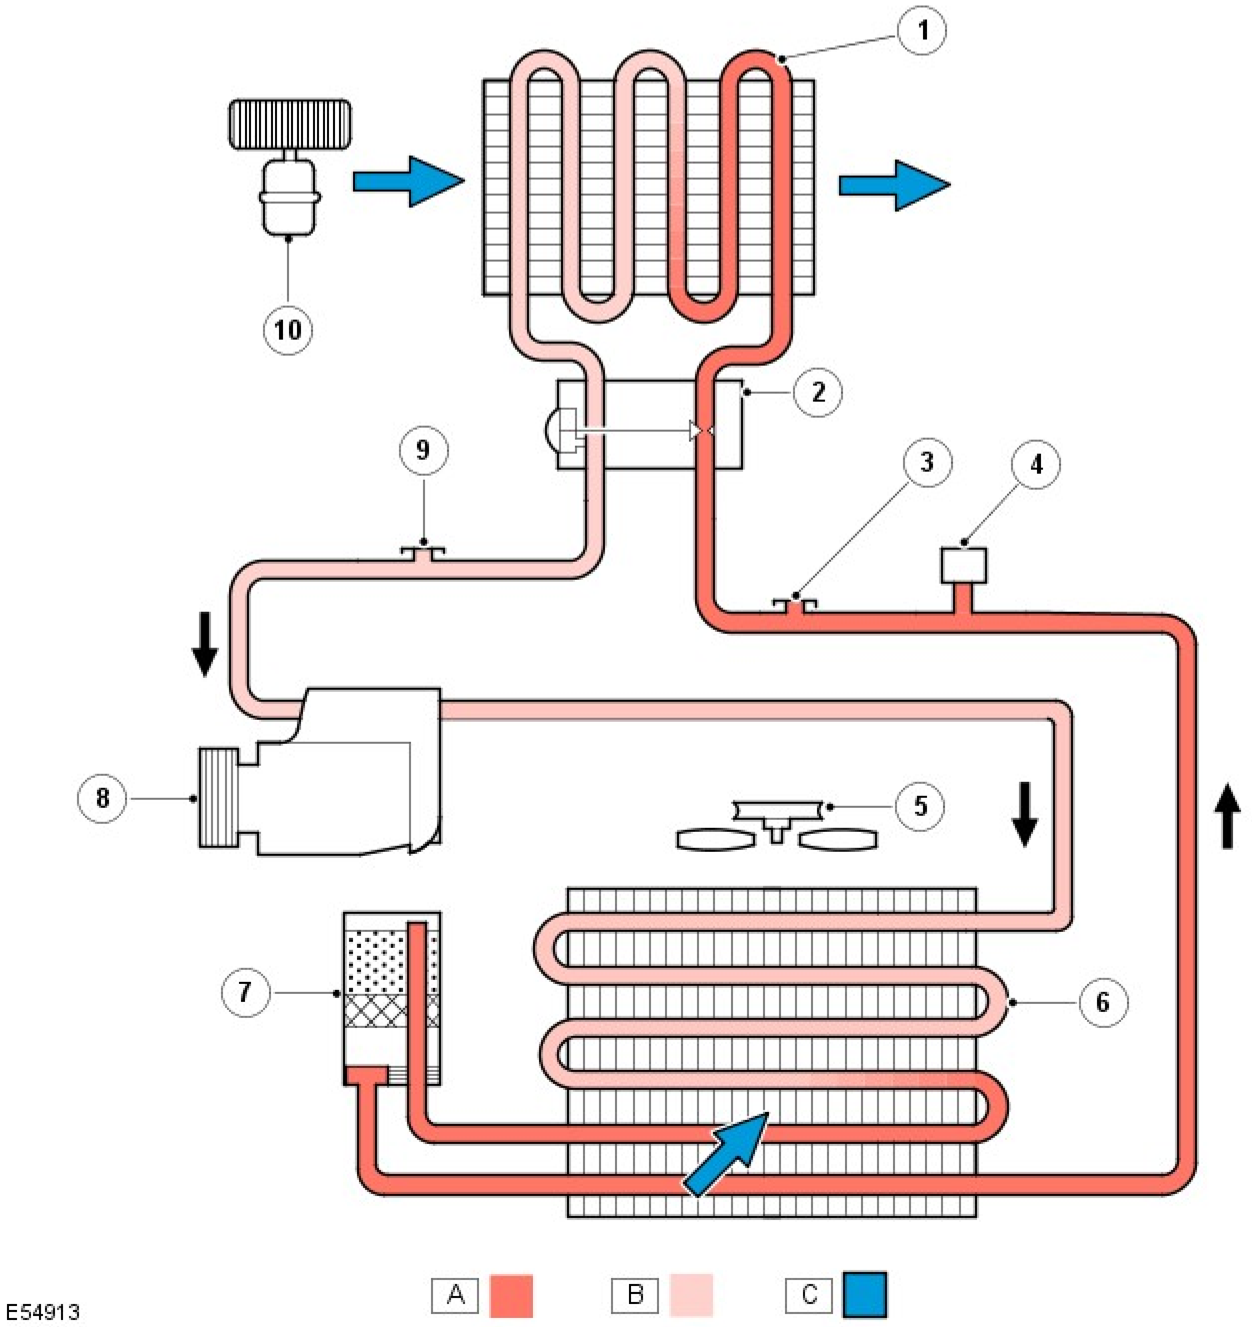
Under normal operating conditions, the smaller diameter pipes (A/C compressor discharge, liquid refrigerant) are hot to the touch and the larger diameter pipes (A/C compressor suction, gaseous refrigerant) are cold to the touch.

SYSTEM OPERATION

To accomplish the transfer of heat, the refrigerant is circulated around the system, where it passes through two pressure/temperature regimes. In each of the pressure/temperature regimes, the refrigerant changes state, during which process maximum heat absorption or release occurs. The low pressure/temperature regime is from the thermostatic expansion valve, through the evaporator to the compressor; the refrigerant decreases in pressure and temperature at the thermostatic expansion valve, then changes state from liquid to vapor in the evaporator, to absorb heat. The high pressure/temperature regime is from the compressor, through the condenser and receiver drier to the thermostatic expansion valve; the refrigerant increases in pressure and temperature as it passes through the compressor, then releases heat and changes state from vapor to liquid in the condenser.

A/C SYSTEM SCHEMATIC

- NOTE: A = Refrigerant liquid; B = Refrigerant vapor; C = Air flow



Item	Part Number	Description
1	-	Evaporator
2	-	Thermostatic expansion valve
3	-	High pressure servicing connection
4	-	Refrigerant pressure sensor
5	-	Cooling fan
6	-	Condenser
7	-	Receiver drier
8	-	A/C compressor
9	-	Low pressure servicing connection
10	-	Blower

Air Conditioning - V8 S/C 4.2L Petrol - Air Conditioning

Diagnosis and Testing

Overview

Due to the different equipment available in dealers, there are no specifics as to the connection of gauge sets or charging and recovery stations. Refer to the instructions for the equipment in use in your own workshop.

For information on the description and operation of the system, refer to section 412-03 - Air Conditioning in the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
● Auxiliary drive belt condition and tension ● Compressor condition and installation ● Condenser condition and installation/blockage ● Air conditioning hoses and pipes ● Receiver/drier condition and installation ● Cooling fan	● Fuses ● Harnesses ● Electrical connector(s) ● Relays ● Sensors ● Control panel(s) ● Air conditioning compressor

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom chart

Symptom chart

Symptom	Possible causes	Action
Poor or no cooling	● Drive belt fault ● Compressor fault ● Distribution motor/flap fault ● Refrigerant leak ● In-vehicle temperature sensor fault ● Refrigerant pressure sensor fault	Check the drive belt condition and tension (see visual inspection). Check the compressor operation (observe the compressor as the engine is idling with the air conditioning switched on. If the compressor runs erratically or does not run. Carry out the distribution motor self test. Refer to the relevant workshop manual section. Check for sensor DTCs. Refer to the DTC index. Check the refrigerant system using your charging station.
Noise	● Drive belt fault ● Compressor fault ● Compressor pulley fouling ● Refrigerant overcharged	Confirm the air conditioning as the source of the noise by listening for the noise with the air conditioning switched off. Refer to the relevant workshop manual section. Check the refrigerant system using your charging station.
Water entry into cabin	● Heater matrix leak ● Blocked evaporator drain tubes	Check for coolant loss. Pressure test the cooling system as necessary. Check and clear the evaporator drain tubes as necessary.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible cause	Action
B1A6111	Cabin Temperature Sensor	● Ambient air temperature sensor signal short circuit to ground	Refer to the electrical guides and check the ambient air temperature sensor circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A6115	In-Vehicle Temperature Sensor Signal	● Ambient air temperature sensor signal high resistance ● In-vehicle temperature sensor signal short circuit to power	Refer to the electrical guides and check the ambient air temperature sensor circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A6211	Pressure Sensor	● A/C refrigerant pressure sensor signal short circuit to ground	Refer to the electrical guides and check the pressure sensor circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A6215	Pressure Sensor	● A/C refrigerant pressure sensor signal short circuit to power	Refer to the electrical guides and check the pressure sensor circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A7001	Compressor Solenoid +ve Supply	● Refrigerant solenoid valve power circuit short circuit to ground ● Refrigerant solenoid valve power circuit short circuit to power ● Refrigerant solenoid valve over temperature	Refer to the electrical guides and check the refrigerant solenoid circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1B7884	System Pressure	● Pressure signal below allowable range ● Refrigerant leak	Check for pressure sensor DTcs. Check the refrigerant system using a suitable charging station.
B1B7885	System Pressure	● Pressure signal above allowable range ● Condenser fault ● Cooling fan fault	Check for pressure sensor DTcs. Check the condenser for damage/restriction and the cooling fan operation. Check the refrigerant system using a suitable charging station.

Air Conditioning - V8 S/C 4.2L Petrol - Air Conditioning (A/C) Compressor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Recover the A/C refrigerant.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

3. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the LH front wheel.

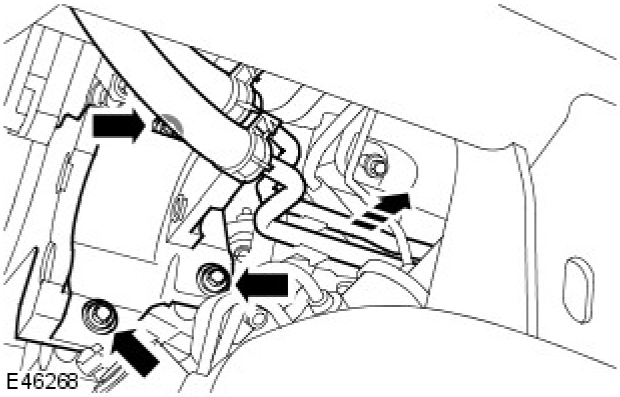
5. Remove the fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

6. Remove the power steering pump.
For additional information, refer to: Power Steering Pump - V8 S/C 4.2L Petrol (211-02 Power Steering, Removal and Installation).

7. Release the transmission cooler pipe clips.

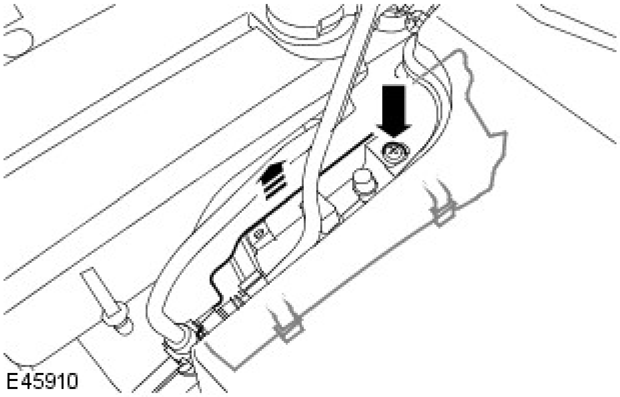
8. Remove the power steering pump mounting bracket.

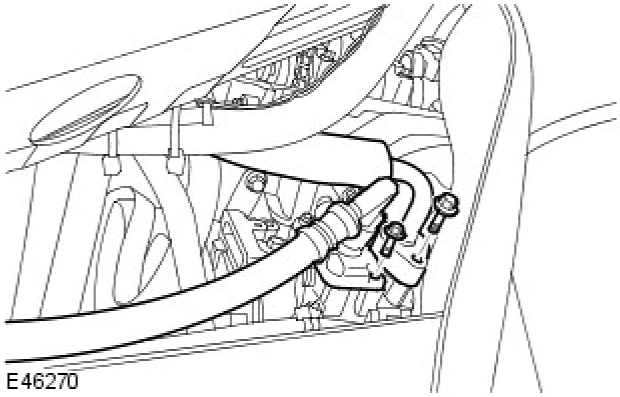
- Remove the 3 bolts.



9. Remove the engine compartment LH upper heat shield.

- Remove the screw.
- Release the 2 mounting clips.



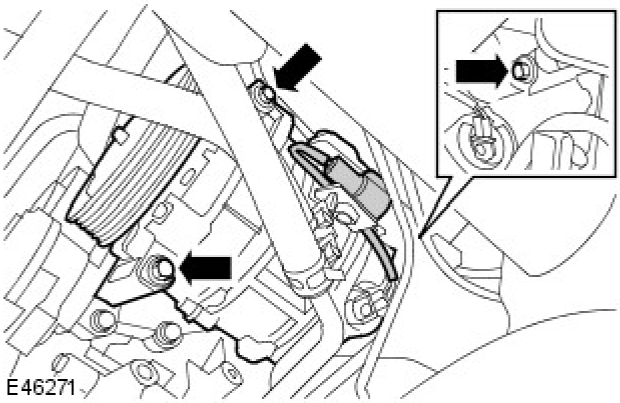


10. ⚠ CAUTION: Always plug any open connections to prevent contamination.

Disconnect the refrigerant lines from the A/C compressor.

- Remove the 2 bolts.
- Remove and discard the O-ring seal.

11. Disconnect the A/C clutch electrical connector.



12. ⚠ CAUTION: Always plug any open connections to prevent contamination.

Remove the A/C compressor.

- Remove the 3 bolts.

Installation

1. Install the A/C compressor.

- If a new compressor is being installed, the required amount of refrigerant oil must be drained from it.
- Tighten the bolts to 25 Nm (18 lb.ft).

2. Connect the A/C clutch electrical connector.

3. Connect the refrigerant lines.

- Clean the component mating faces.
- Install the new O-ring seals.

4. Install the engine compartment upper LH heat shield.

5. Install the power steering pump mounting bracket.

- Tighten the bolts to 25 Nm (18 lb.ft).

6. Install the power steering pump.
For additional information, refer to: Power Steering Pump - V8 S/C 4.2L Petrol (211-02 Power Steering, Removal and Installation).

7. Secure the transmission cooler pipes into clips.

8. Install the fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

9. Install the front wheel.

- Tighten the nuts to 115 Nm (85 lb.ft).

10. Fill the A/C system.
For additional information, refer to: Air Conditioning (A/C) System

Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

11. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Published: 11-May-2011

Air Conditioning - V8 S/C 4.2L Petrol - Evaporator Core

Removal and Installation

Removal

1. Remove the engine cover.
For additional information, refer to: Engine Cover - V8 S/C 4.2L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).

2. Evacuate the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

3. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

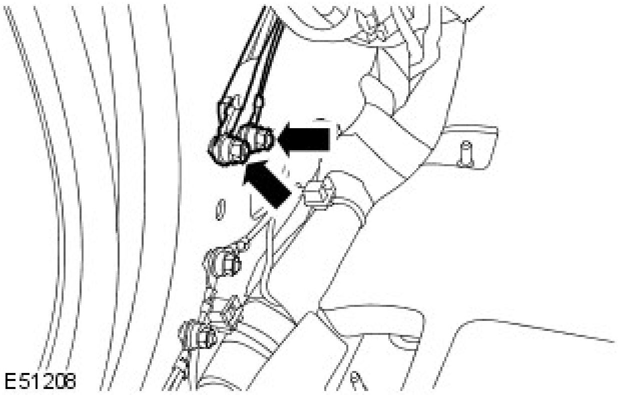
4. Drain the cooling system.
For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03A Engine Cooling - V8 S/C 4.2L Petrol, General Procedures).

5. Remove the driver side front seat.
For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).

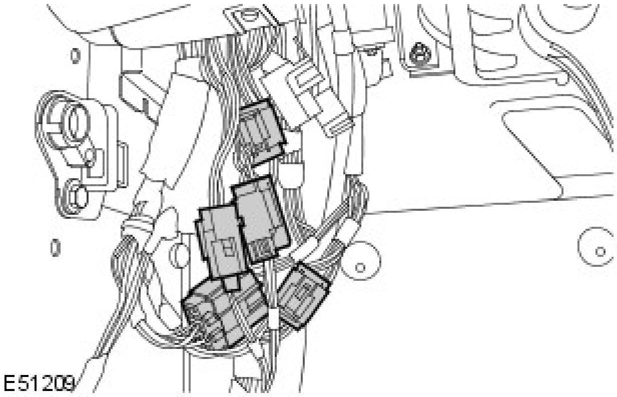
6. Remove the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).

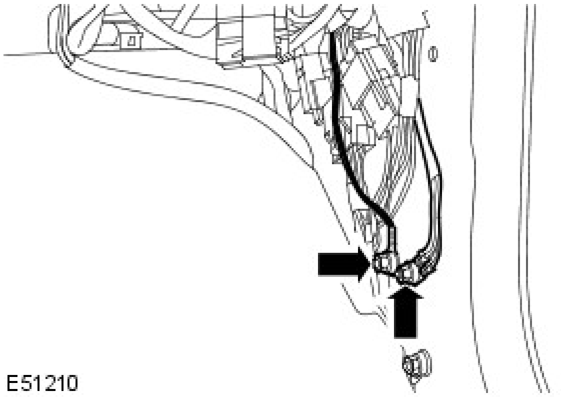
7. Release the 3 ground cables from the driver side lower A-pillar.

- Remove the 2 nuts.



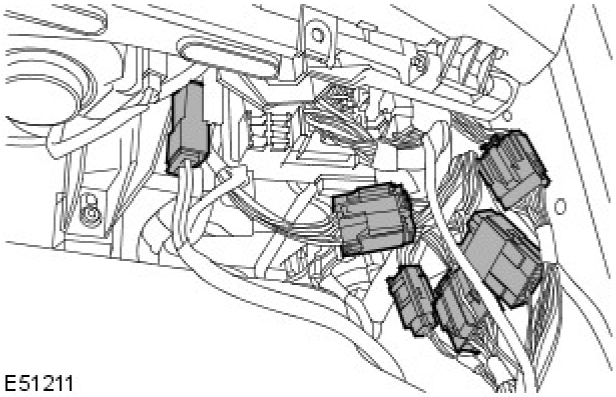
8. Disconnect the 5 electrical connectors from the driver side lower A-pillar.



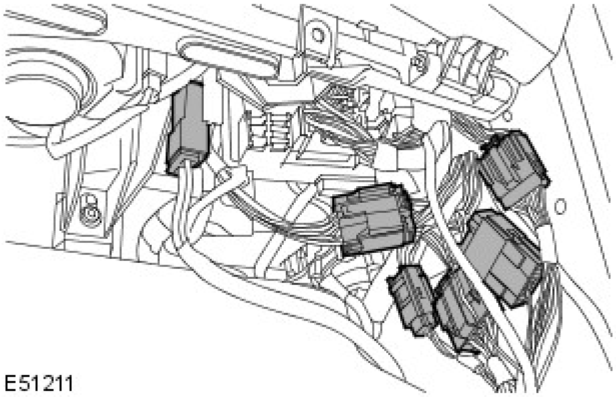


9. Release the 3 ground cables from the passenger side lower A-pillar.

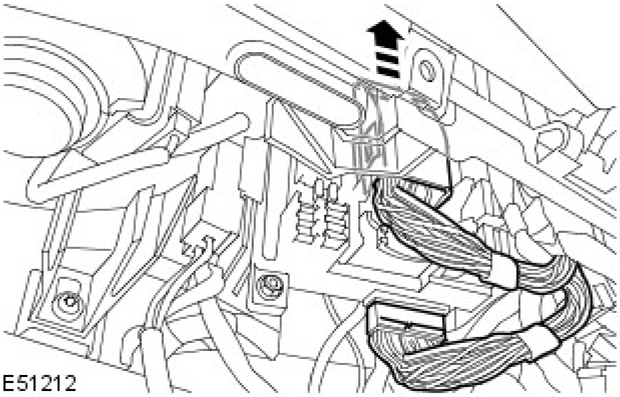
- Remove the 2 nuts.



10. Disconnect the 5 electrical connectors from the passenger side lower A-pillar.

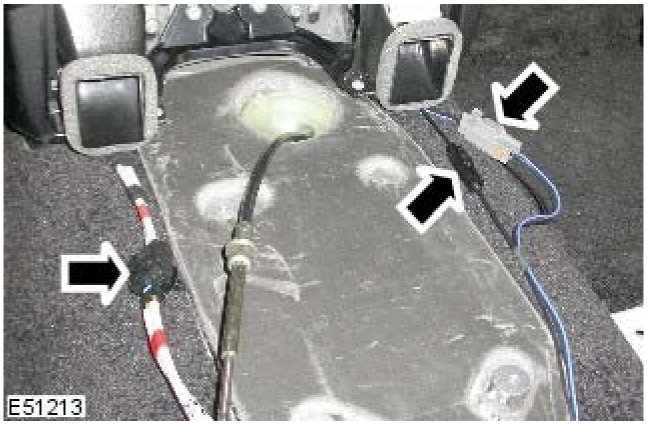


11. Disconnect the heater motor electrical connector.



12. Disconnect 2 central junction box (CJB) electrical connectors.

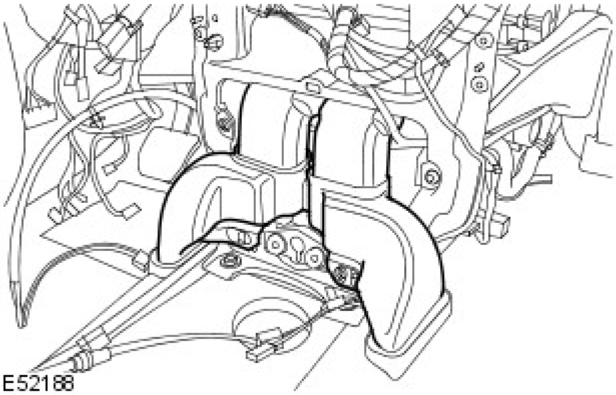
13. Disconnect 2 electrical connectors from the instrument panel center reinforcement.



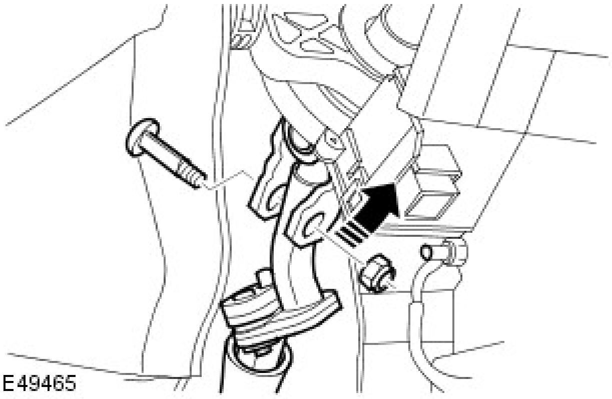
14. ⚠ CAUTION: Cover fibre optic cable connectors to minimise dust ingress and avoid bending the cables in a radius of less than 30 mm.

If installed, disconnect the instrument panel center reinforcement fibre optic cables.

- Disconnect the electrical connector.

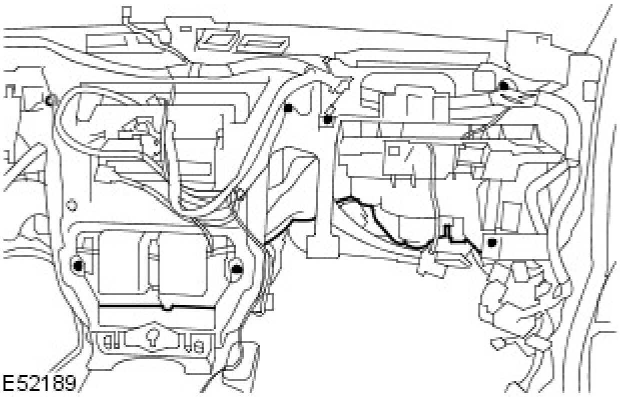


15. Remove the heater housing center ducts.



16. Disconnect the steering column intermediate shaft from the steering column.

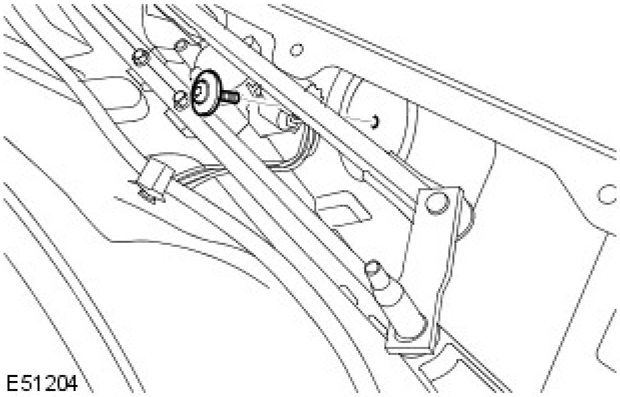
- Note the fitted position.
- Remove the special bolt and discard the nut.



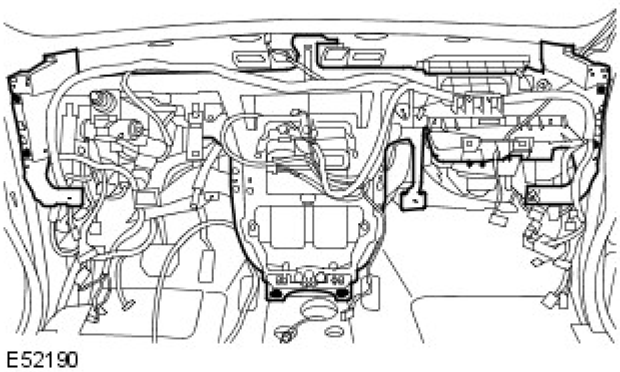
17. Release the heater housing from the instrument panel carrier.

- Remove the 7 Torx screws.

18. Remove the plenum chamber panel.
For additional information, refer to: Plenum Chamber (412-01 Air Distribution and Filtering, Removal and Installation).

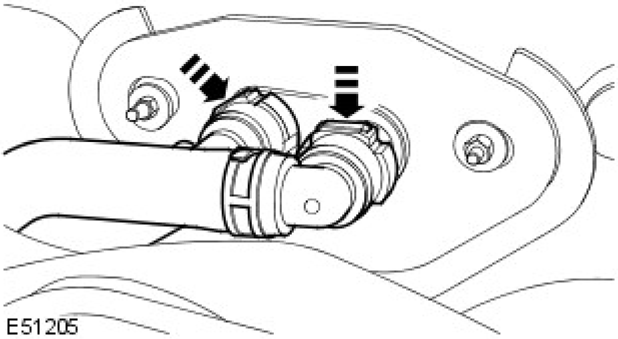


19. Remove the instrument panel carrier to bulkhead Torx bolt.



20. With assistance, remove the instrument panel.

- Remove the 6 Torx bolts.



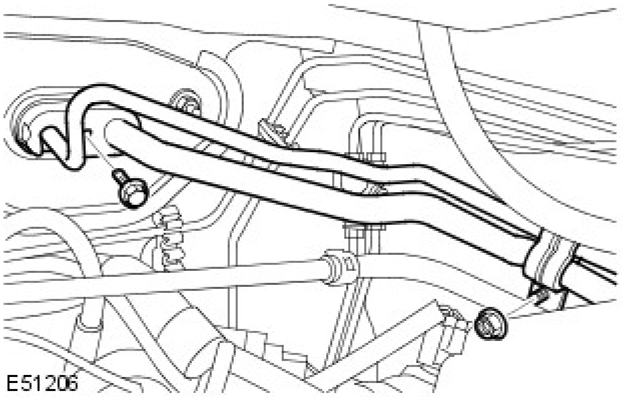
21. ⚠ CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect 2 heater hoses from the bulkhead.

- Release the clips.

22. Release 2 A/C lines from the body.

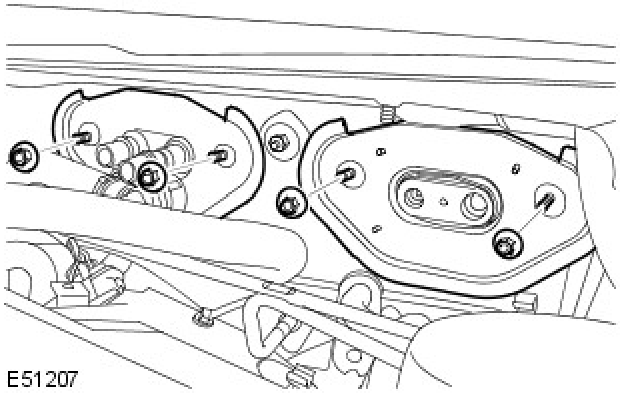
- Remove the nut.



23. ⚠ CAUTION: Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

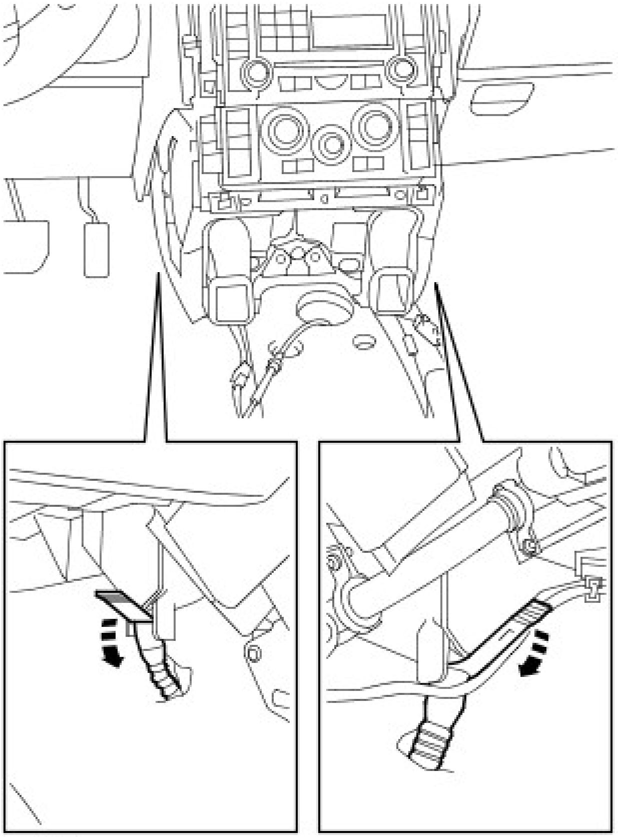
Release 2 A/C lines from the bulkhead.

- Remove the bolt.
- Remove and discard the O-ring seals.



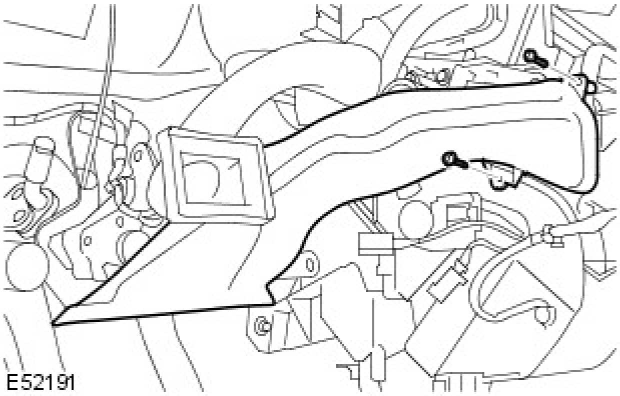
24. Remove the 2 adaptor panels.

- Remove the 4 nuts.



E51199

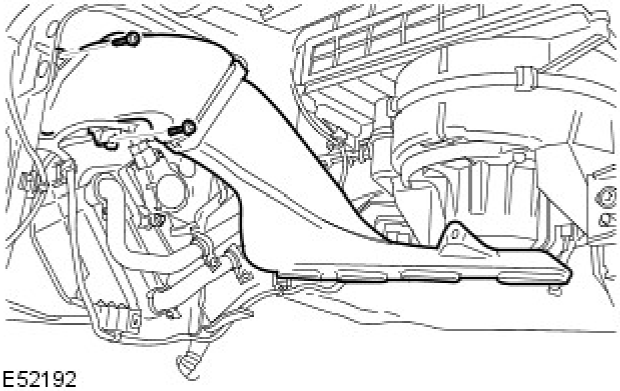
25. Disconnect 2 drain tubes from the heater housing.



E52191

26. Remove the driver side footwell duct.

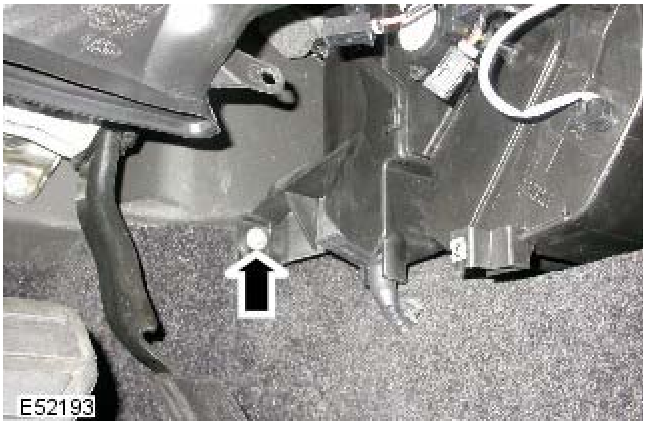
- Remove the 2 Torx screws.



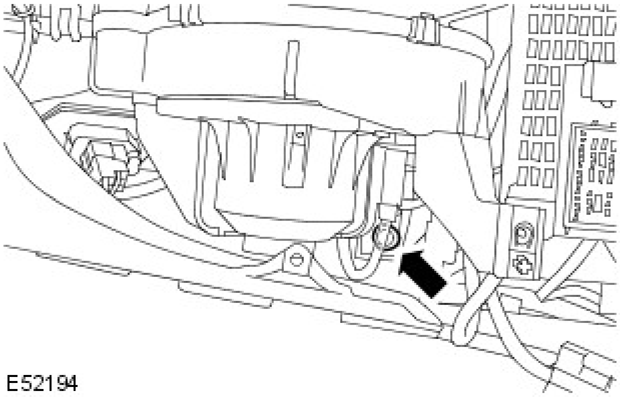
E52192

27. Remove the passenger side footwell duct.

- Remove the 2 Torx screws.



28. Driver side: Remove the heater housing to bulkhead Torx bolt.

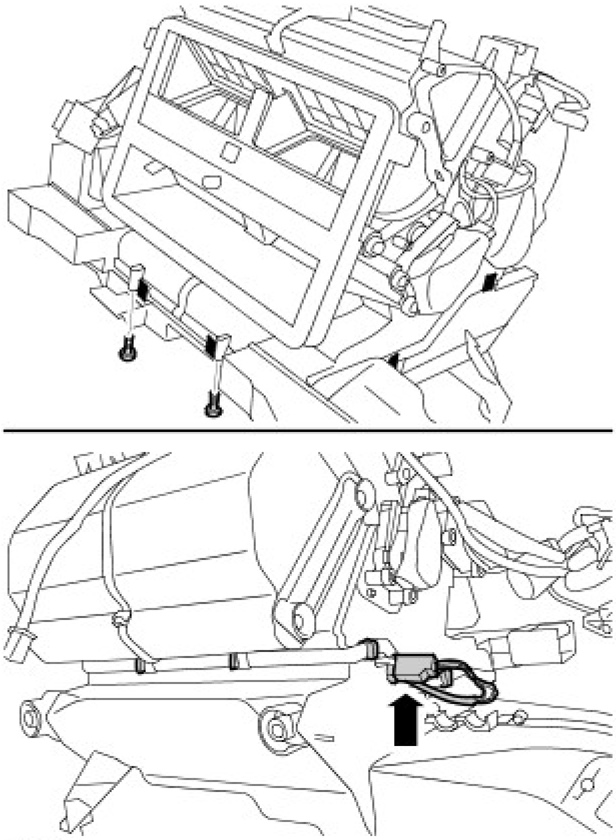


29. Passenger side: Remove the heater housing to bulkhead Torx bolt.

30. Remove the heater housing.

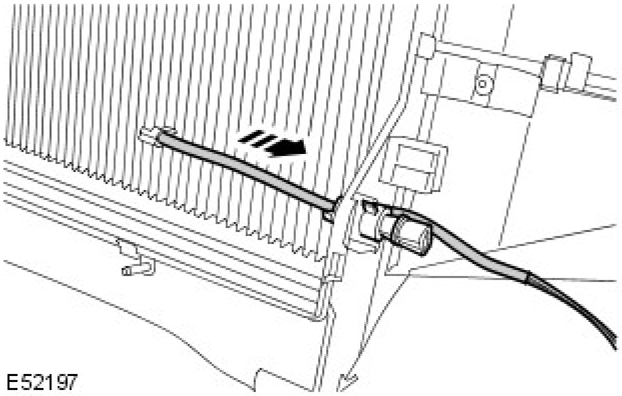
31. Disconnect the evaporator core temperature sensor electrical connector.

32. Release the heater core housing.
  - Remove the 2 screws.
  - Remove the 8 clips.



E52196

33. Remove the evaporator core.
  - Release the temperature sensor.



E52197

Installation

1. Install the evaporator core.
  - Secure the temperature sensor.
2. Secure the heater core housing.
  - Install the clips.
  - Tighten the screws.
3. Connect the temperature sensor electrical connector.
4. Install the heater housing.
5. Passenger side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).

6. Driver side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).

7. Install the footwell ducts.

- Tighten the Torx screws.

8. Connect the drain tubes to the heater housing.

9. Install the adaptor panels.

- Tighten the nuts to 6 Nm (4 lb.ft).

10. Secure the A/C lines to the bulkhead.

- Clean the components.
- Install new O-ring seals.
- Tighten the bolt to 6 Nm (4 lb.ft).

11. Secure the A/C lines to the body.

- Tighten the nut to 6 Nm (4 lb.ft).

12. Connect the bulkhead heater hoses.

13. With assistance, install the instrument panel.

- Tighten the Torx bolts to 25 Nm (18 lb.ft).

14. Install the instrument panel carrier to bulkhead Torx bolt and tighten to 25 Nm (18 lb.ft).

15. Install the plenum chamber panel.
For additional information, refer to: Plenum Chamber (412-01 Air Distribution and Filtering, Removal and Installation).

16. Secure the heater housing.

- Tighten the screws.

17. Connect the steering column intermediate shaft.

- Install the special bolt and tighten the new nut to 22 Nm (16 lb.ft).

18. Install the heater housing center ducts.

19. Connect the instrument panel center reinforcement fibre optic cables.

20. Connect the instrument panel center reinforcement electrical connectors.

21. Connect the CJB electrical connectors.

22. Connect the heater motor electrical connector.

23. Connect the electrical connectors to the passenger side lower A-pillar.

24. Connect the ground cables to the passenger side lower A-pillar.

- Tighten the nuts to 10 Nm (7 lb.ft).

25. Connect the electrical connectors to the driver side lower A-pillar.

26. Connect the ground cables to the driver side lower A-pillar.

- Tighten the nuts to 10 Nm (7 lb.ft).

27. Install the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper

Section (501-12 Instrument Panel and Console, Removal and Installation).

28. Install the front seat.
For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).

29. Recharge the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

30. Refill the cooling system.
For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03A Engine Cooling - V8 S/C 4.2L Petrol, General Procedures).

31. Install the engine cover.
For additional information, refer to: Engine Cover - V8 S/C 4.2L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).

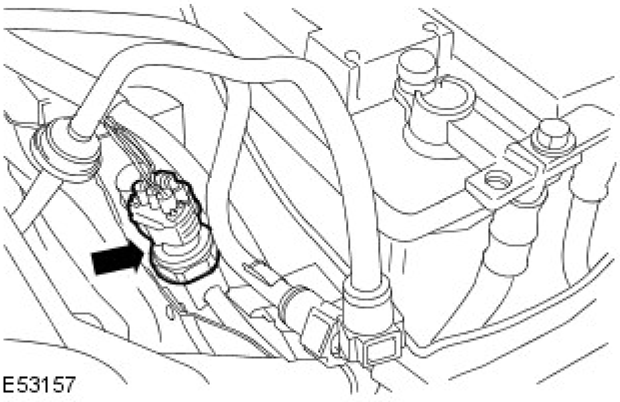
Air Conditioning - V8 S/C 4.2L Petrol - Air Conditioning (A/C) Pressure Transducer

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Recover the A/C refrigerant.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).



3. CAUTIONS:

⚠ Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

⚠ To prevent damage to components, use an additional wrench when loosening or tightening unions.

Remove the A/C pressure transducer.

- Disconnect the electrical connector.
- Remove and discard the seal.

Installation

1. Install the A/C pressure transducer.

- Clean the component mating faces.
- Install a new seal.
- Tighten the transducer to 10 Nm (7 lb.ft).
- Connect the electrical connector.

2. Recharge the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

3. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Removal and Installation

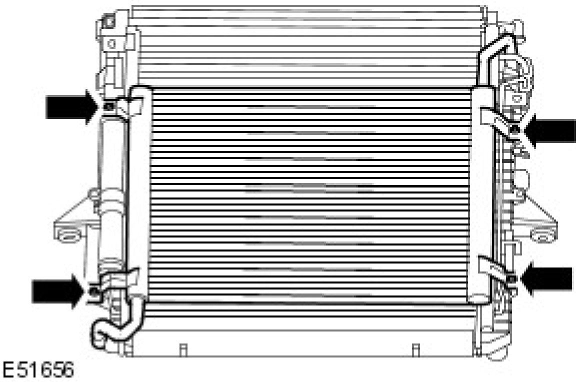
Removal

• NOTE: The receiver drier need only be changed under the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure). The system is leaking and refrigerant has been lost to atmosphere. Refrigerant circuit has been open more than 24 hours due to repair.

• NOTE: Always protect the cooling pack elements to prevent accidental damage.

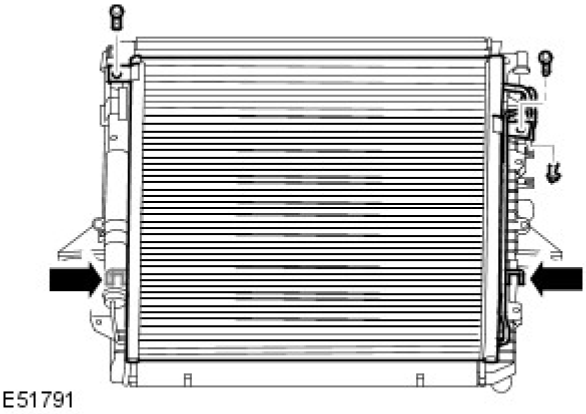
1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the radiator assembly.
For additional information, refer to: Radiator (303-03A Engine Cooling - V8 S/C 4.2L Petrol, Removal and Installation).



3. Remove the supercharger radiator.

- Remove the 4 bolts.



4. NOTE: The receiver drier need only be changed under the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure). The system is leaking and refrigerant has been lost to atmosphere. Refrigerant circuit has been open more than 24 hours due to repair.

Remove the condenser core.

- Remove the 2 screws.
- Release the 2 clips.
- Remove the bolt.

Installation

1. Install the condenser core.

- Align the condenser core.
- Secure the clips.
- Install the screws.
- Tighten the bolt to 6 Nm (4 lb.ft).

2. Install the supercharger radiator.

- Install the 4 bolts and tighten to 10 Nm (7 lb.ft).

3. Install the radiator assembly.
For additional information, refer to: Radiator (303-03A Engine Cooling - V8 S/C 4.2L Petrol, Removal and Installation).

4. Install the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Air Conditioning - V8 S/C 4.2L Petrol - Thermostatic Expansion Valve

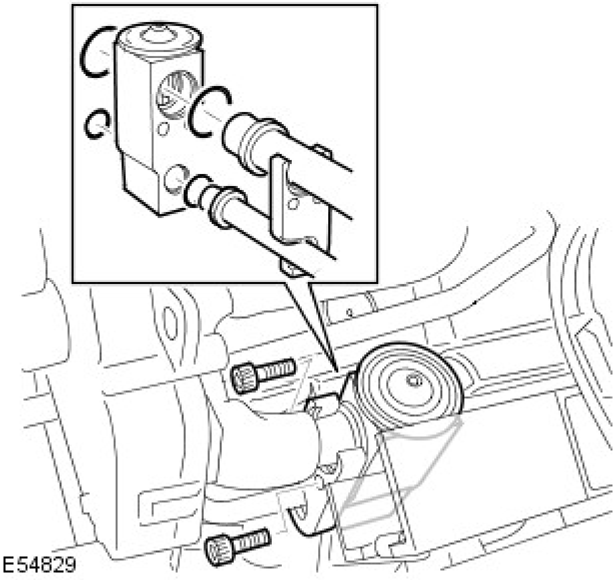
Removal and Installation

Removal

1. Evacuate the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

2. Remove the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).

3. ⚠ CAUTION: Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.



Remove the thermostatic expansion valve.

- Remove the cover.
- Remove the 2 Allen bolts.
- Remove and discard the 4 O-ring seals.

Installation

1. Install the thermostatic expansion valve.

- Clean the components.
- Install the new O-ring seals.
- Tighten the Allen bolts to 5 Nm (4 lb.ft).
- Install the cover.

2. Install the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).

Air Conditioning - V8 S/C 4.2L Petrol - Air Conditioning (A/C) Compressor Pulley

Removal and Installation

Removal

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

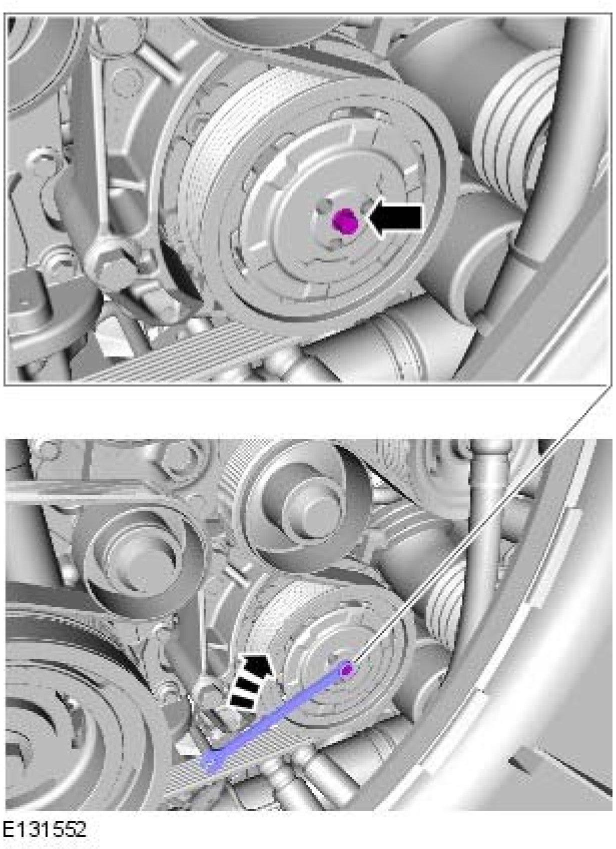
- NOTE: Components removed for clarity.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the cooling fan.
For additional information, refer to: Cooling Fan (303-03A Engine Cooling - V8 S/C 4.2L Petrol, Removal and Installation).

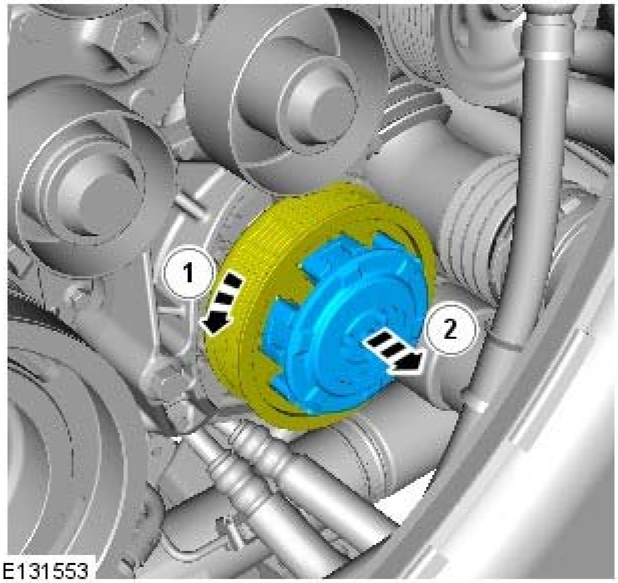
3. Using a suitable tool, release the hub locking stud.

- Rotate the fixing clockwise to release the hub.
- If required, use a suitable tool to prevent the hub from rotating.



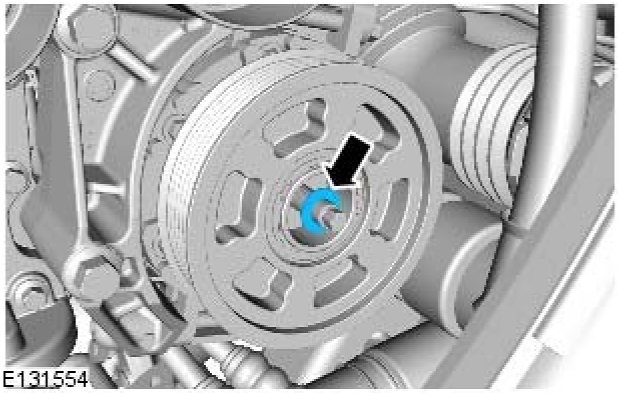
4. NOTE: Using a 3/8 square drive wrench, rotate the tensioner counter clockwise.

Release the accessory drive belt from the A/C compressor pulley.

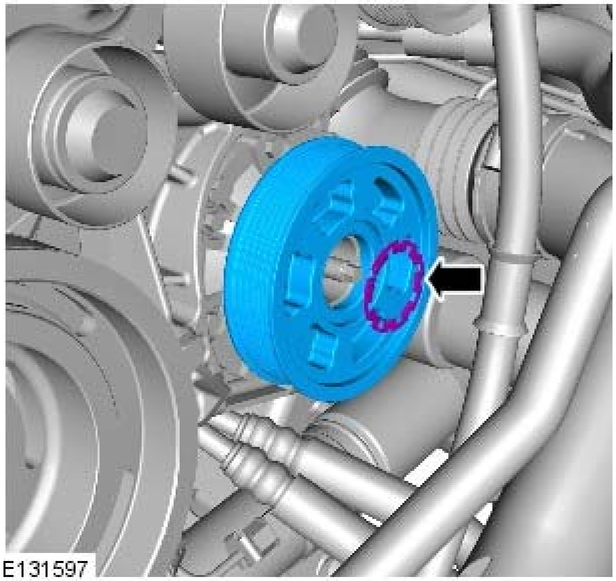


5. Remove and discard the hub assembly.

- Rotate the pulley counter-clockwise, until the hub is released from the pulley.
- Discard the rubber dampers.



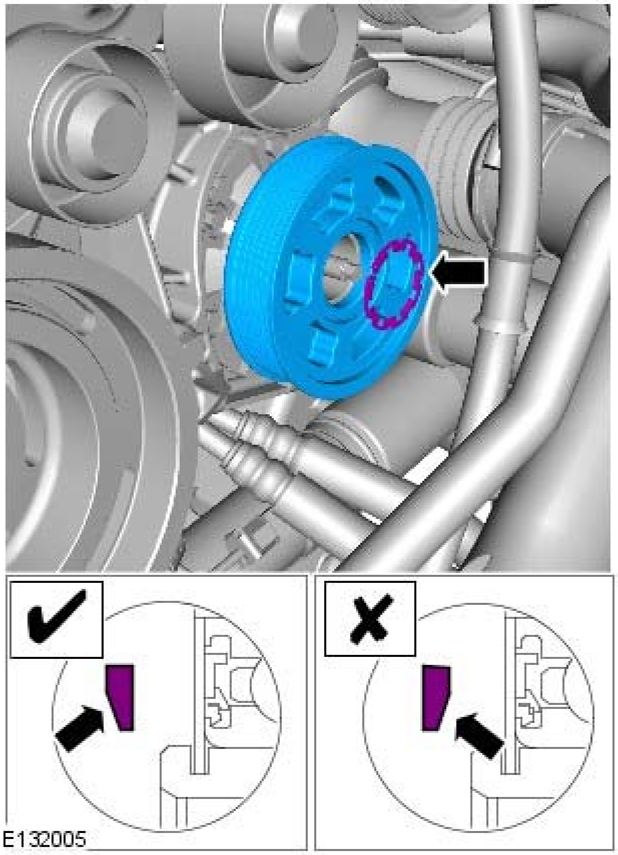
6. Remove and discard the spacer.



7. Remove and discard the drive pulley.

- Remove and discard the circlip.
- Clean the compressor mating surface.

Installation



E132005

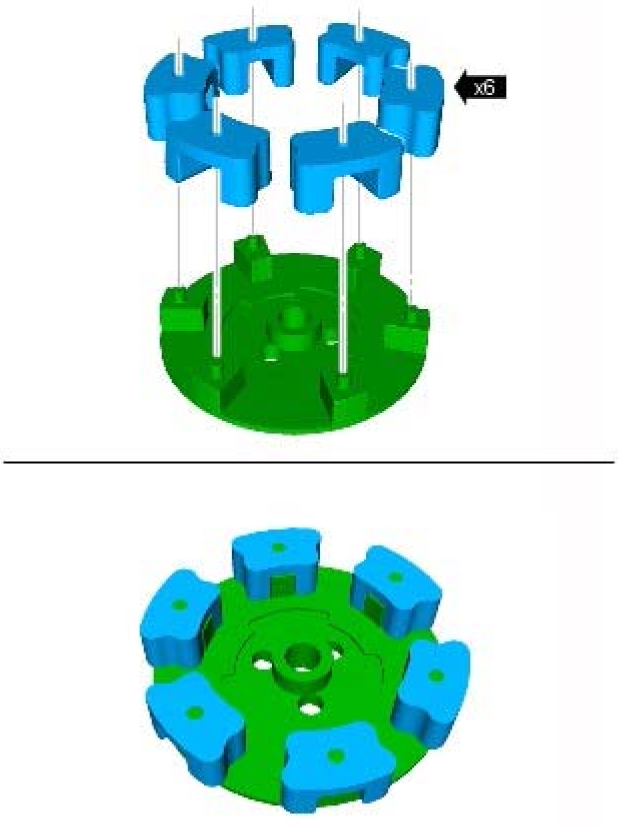
1. ⚠CAUTION: Make sure the circlip is fitted in the correct orientation.

Install the drive pulley.

- Install the circlip.

2. Install the spacer.

- Make sure the spacer is fully seated.



E131556

3. Install the 6 rubber dampers to the hub assembly.

- Make sure the dampers are installed in the correct orientation.

4. NOTE: Apply a suitable water based lubricant to the rubber dampers and to the mating surfaces on pulley.

Install the hub assembly.

- Push the hub assembly onto the pulley, and rotate clockwise to screw it onto the compressor shaft.

5. NOTE: Tighten counterclockwise.

Using a suitable tool, tighten the hub locking stud.

- Prevent the pulley rotating by hand.
- Tighten to 3.5 Nm (2.6 lb.ft)

6. Install the auxiliary drive belt.

7. Install the cooling fan.
For additional information, refer to: Cooling Fan (303-03A Engine Cooling - V8 S/C 4.2L Petrol, Removal and Installation).

8. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Air Conditioning - V8 4.4L Petrol -

Lubricant

Item	Specification
Compressor oil	Denso ND-8 PAG oil
Total system capacity	130 cm³ (4.5 fluid ounces)
Additional amount of oil to be added to system if a component is replaced:	
Condenser	40 cm³ (1.4 fluid ounces)
Evaporator	40 cm³ (1.4 fluid ounces)
Pipe or hose	10 cm³ (0.35 fluid ounces)

System Refrigerant Specification / Capacity

Item	Specification
Refrigerant type	R134A
Total system capacity	600 grammes (21.16 ounces)

General Specification

Item	Description
Compressor:	
Make	Denso
Type	7SEU17
Sensor locations:	
Ambient temperature sensor	At the front of the vehicle
Smog sensor	At the front of the vehicle adjacent to the ambient temperature sensor
ICS/humidity sensor	On the instrument panel adjacent to the steering column
Solar sensor	On the vehicle centre line on top of the instrument panel
Pressure transducer	In A/C line - LH side of engine compartment

Torque Specifications

Description	Nm	lb-ft
Compressor mounting bolts	25	18
Receiver/drier mounting bolts	10	7
Refrigerant line bolts	6	4
Condenser core bolts	6	4
A/C pipe to condenser bolts	6	4
Coolant expansion tank bolts	10	7
Heater housing to bulkhead Torx bolts	6	4
Adaptor panel nuts	6	4
Air conditioning lines to bulkhead bolt	6	4
Air conditioning lines to body nut	6	4
Instrument panel Torx bolts	25	18
Instrument panel carrier to bulkhead Torx bolt	25	18
* Steering column intermediate shaft nut	22	16
Ground cables to passenger side lower A-pillar nuts	10	7
Ground cables to driver side lower A-pillar nuts	10	7
Pressure transducer	10	7
Power steering pump mounting bracket bolts	25	18
Supercharger radiator bolts	10	7
Thermostatic expansion valve	5	4

*** New nut must be installed**

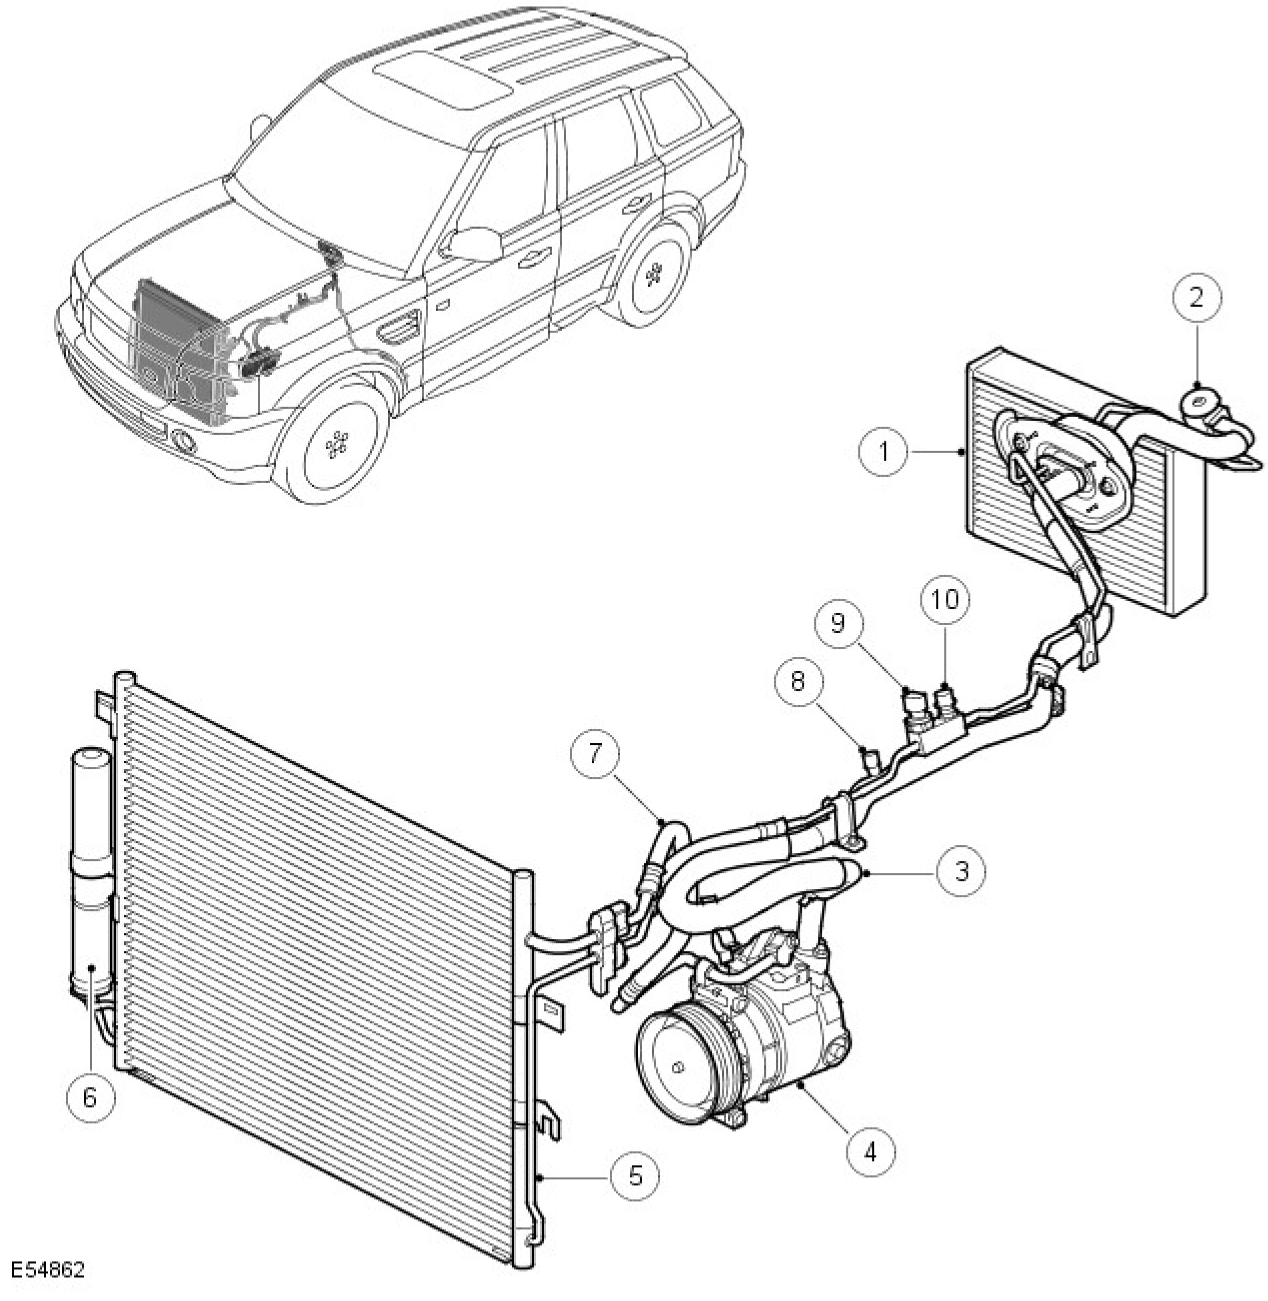
Air Conditioning - V8 4.4L Petrol - Air Conditioning

Description and Operation

COMPONENT LOCATIONS



Item	Part Number	Description
1	-	Evaporator
2	-	Thermostatic expansion valve
3	-	Low pressure line
4	-	air conditioning (A/C) compressor
5	-	Condenser
6	-	Receiver drier
7	-	High pressure line
8	-	Low pressure servicing connection
9	-	Refrigerant pressure sensor (reference)
10	-	High pressure servicing connection

For additional information, refer to: Air Conditioning (412-03A Air Conditioning - V8 S/C 4.2L Petrol, Description and Operation).

Published: 11-May-2011

Air Conditioning - V8 4.4L Petrol - Air Conditioning

Diagnosis and Testing

Overview

Due to the different equipment available in dealers, there are no specifics as to the connection of gauge sets or charging and recovery stations. Refer to the instructions for the equipment in use in your own workshop.

For information on the description and operation of the system, refer to section 412-03 - Air Conditioning in the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
Auxiliary drive belt condition and tension Compressor condition and installation Condenser condition and installation/blockage Air conditioning hoses and pipes Receiver/Drier condition and installation Cooling fan	Fuses Harnesses Electrical connector(s) Relays Sensors Control panel(s) Air conditioning compressor

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom chart

Symptom chart

Symptom	Possible causes	Action
Poor or no cooling	Drive belt fault Compressor fault Distribution motor/flap fault Refrigerant leak In-vehicle temperature sensor fault Refrigerant pressure sensor fault	Check the drive belt condition and tension (see visual inspection). Check the compressor operation (observe the compressor as the engine is idling with the air conditioning switched on. If the compressor runs erratically or does not run. Carry out the distribution motor self test. Refer to the relevant workshop manual section. Check for sensor DTCs. Refer to the DTC index. Check the refrigerant system using your charging station.
Noise	Drive belt fault Compressor fault Compressor pulley fouling Refrigerant overcharged	Confirm the air conditioning as the source of the noise by listening for the noise with the air conditioning switched off. Refer to the relevant workshop manual section. Check the refrigerant system using your charging station.
Water entry into cabin	Heater matrix leak Blocked evaporator drain tubes	Check for coolant loss. Pressure test the cooling system as necessary. Check and clear the evaporator drain tubes as necessary.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible cause	Action
B1A6111	Cabin Temperature Sensor	● Ambient air temperature sensor signal short circuit to ground	Refer to the electrical guides and check the ambient air temperature sensor circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A6115	In-Vehicle Temperature Sensor Signal	● Ambient air temperature sensor signal high resistance ● In-vehicle temperature sensor signal short circuit to power	Refer to the electrical guides and check the ambient air temperature sensor circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A6211	Pressure Sensor	● A/C refrigerant pressure sensor signal short circuit to ground	Refer to the electrical guides and check the pressure sensor circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A6215	Pressure Sensor	● A/C refrigerant pressure sensor signal short circuit to power	Refer to the electrical guides and check the pressure sensor circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A7001	Compressor Solenoid +ve Supply	● Refrigerant solenoid valve power circuit short circuit to ground ● Refrigerant solenoid valve power circuit short circuit to power ● Refrigerant solenoid valve over temperature	Refer to the electrical guides and check the refrigerant solenoid circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1B7884	System Pressure	● Pressure signal below allowable range ● Refrigerant leak	Check for pressure sensor DTcs. Check the refrigerant system using a suitable charging station.
B1B7885	System Pressure	● Pressure signal above allowable range ● Condenser fault ● Cooling fan fault	Check for pressure sensor DTcs. Check the condenser for damage/restriction and the cooling fan operation. Check the refrigerant system using a suitable charging station.

Air Conditioning - V8 4.4L Petrol - Air Conditioning (A/C) Compressor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

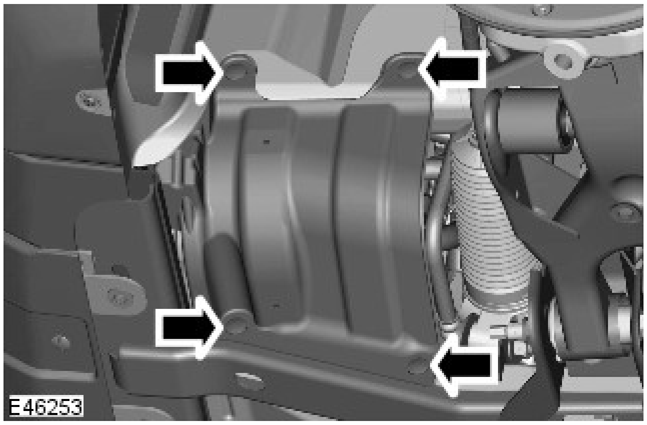
2. Recover the A/C refrigerant.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

3. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the front wheel.

5. Remove the fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

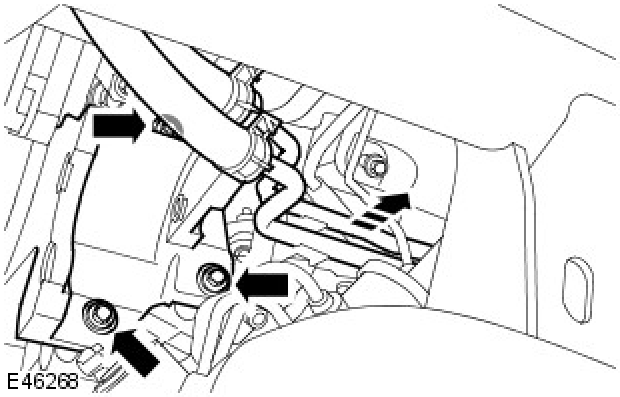


6. Remove the splash shield.

- Remove the 4 screws.

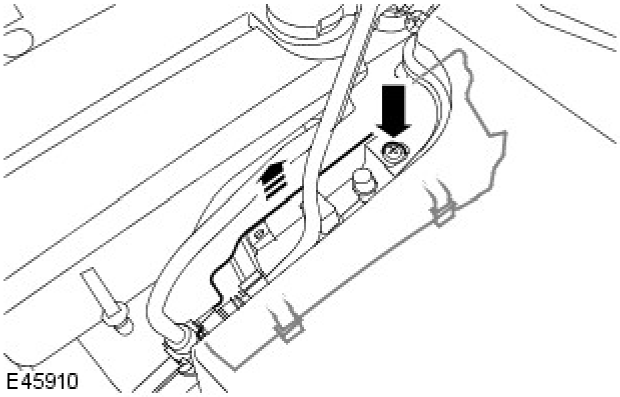
7. Remove the power steering pump.
For additional information, refer to: Power Steering Pump - V8 4.4L Petrol (211-02 Power Steering, Removal and Installation).

8. Release the transmission cooler pipe clips.

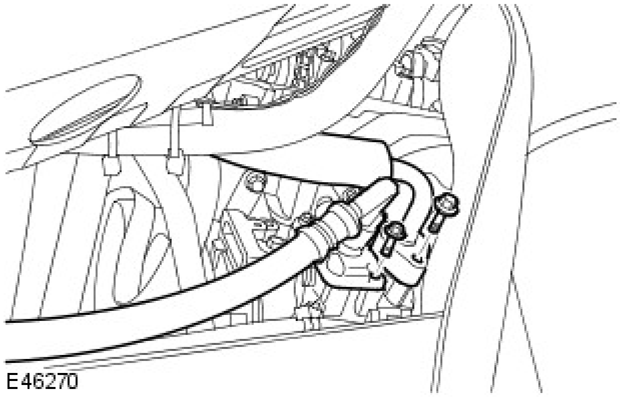


9. Remove the power steering pump mounting bracket.

- Remove the 3 bolts.



10. Remove the engine compartment LH upper heat shield.

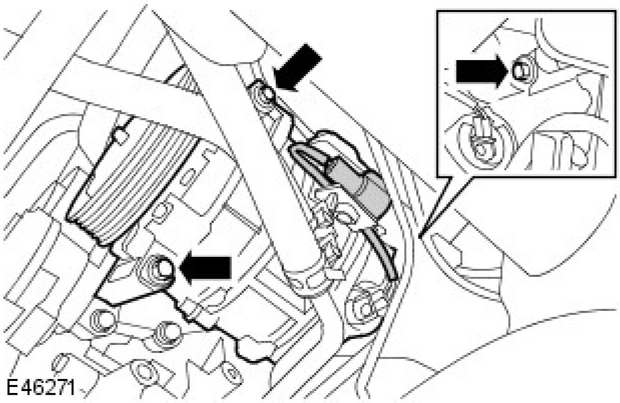


11. ⚠CAUTION: Always plug any open connections to prevent contamination.

Disconnect the refrigerant lines from the A/C compressor.

- Remove the 2 bolts.
- Remove and discard the O-ring seal.

12. Disconnect the A/C clutch electrical connector.



13. ⚠CAUTION: Always plug any open connections to prevent contamination.

Remove the A/C compressor.

- Remove the 3 bolts.

Installation

1. Install the new A/C compressor.

- If a new compressor is being installed, drain the required amount of refigerant oil from the new compressor.
- Tighten the bolts to 25 Nm (18 lb.ft).

2. Connect the A/C clutch electrical connector.

3. Connect the refrigerant lines.

- Clean the component mating faces.
- Install the new O-ring seals.

- Tighten the bolts to 10 Nm (7 lb.ft).

4. Install the engine compartment upper LH heat shield.

5. Install the power steering pump mounting bracket.

- Clean the component mating faces.
- Tighten the bolts to 25 Nm (18 lb.ft).

6. Install the power steering pump.
For additional information, refer to: Power Steering Pump - V8 4.4L Petrol (211-02 Power Steering, Removal and Installation).

7. Secure the transmission cooler pipes into clips.

8. Install the fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

9. Install the splash shield.

10. Install the front wheel.

- Tighten the nuts to 115 Nm (85 lb.ft).

11. Lower the vehicle.

12. Fill the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

13. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Published: 11-May-2011

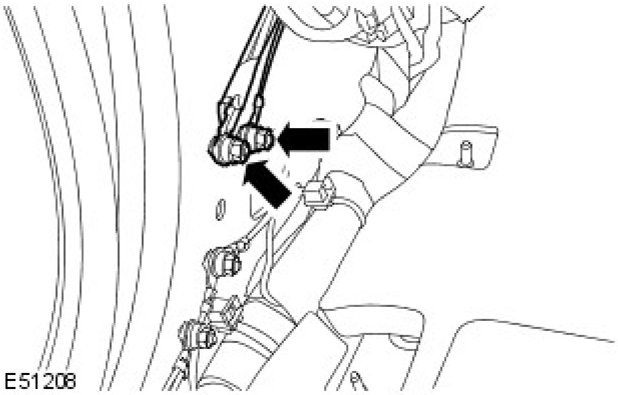
Air Conditioning - V8 4.4L Petrol - Evaporator Core Orifice

Removal and Installation

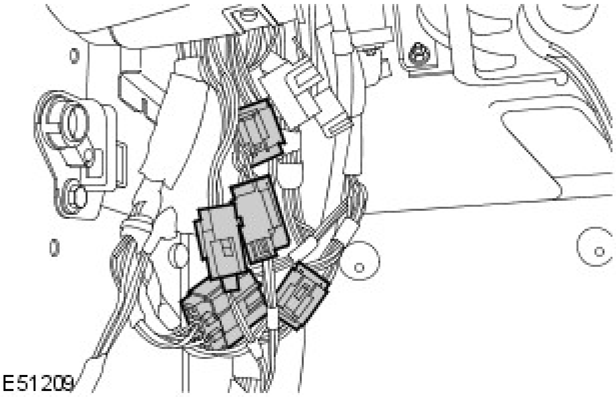
Removal

1. Remove the engine cover.
   For additional information, refer to: Engine Cover - V8 4.4L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).
2. Evacuate the A/C system.
   For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).
3. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.
4. Drain the cooling system.
   For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03B Engine Cooling - V8 4.4L Petrol, General Procedures).
5. Remove the driver side front seat.
   For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).
6. Remove the instrument panel upper section.
   For additional information, refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).
7. Release the 3 ground cables from the driver side lower A-pillar.
   - Remove the 2 nuts.

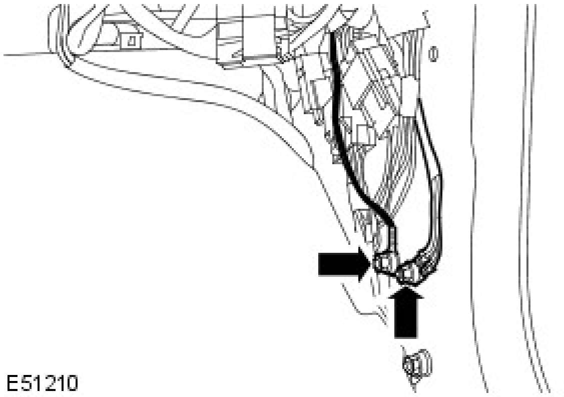


8. Disconnect the 5 electrical connectors from the driver side lower A-pillar.



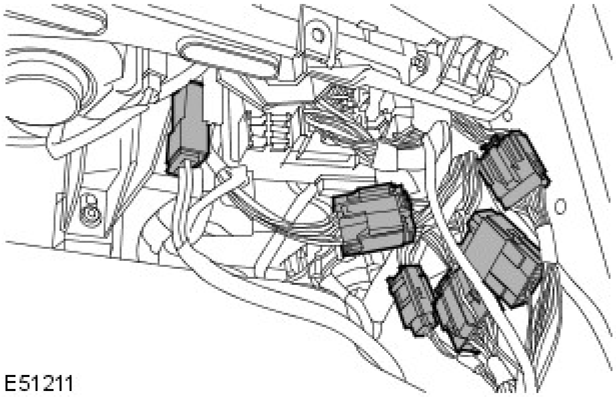
9. Release the 3 ground cables from the passenger side lower A-pillar.

   - Remove the 2 nuts.

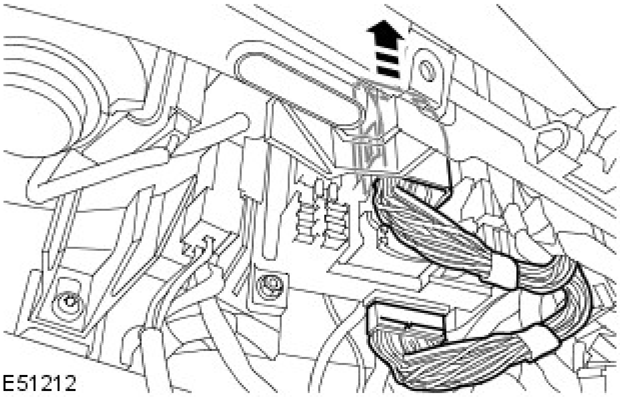


10. Disconnect the 5 electrical connectors from the passenger side lower A-pillar.

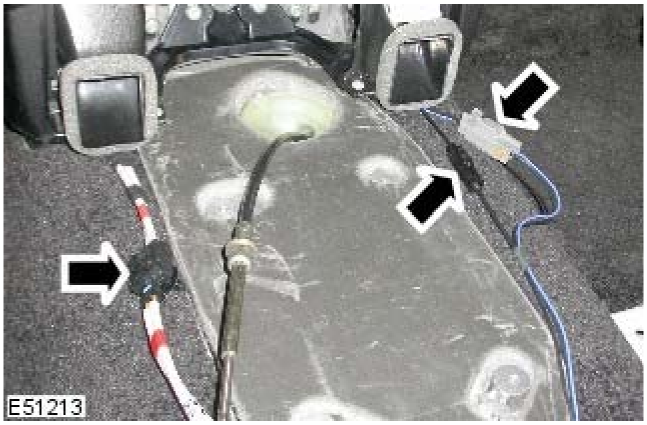
11. Disconnect the heater motor electrical connector.



12. Disconnect 2 central junction box (CJB) electrical connectors.



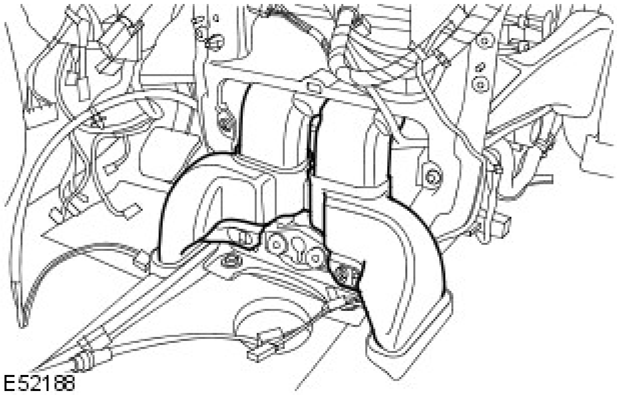
13. Disconnect 2 electrical connectors from the instrument panel center reinforcement.



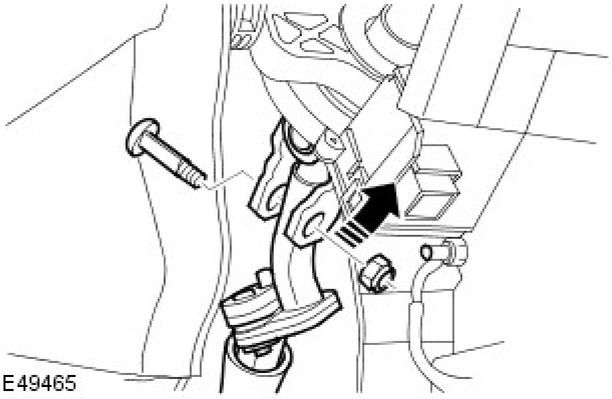
14. ⚠ CAUTION: Cover fibre optic cable connectors to minimise dust ingress and avoid bending the cables in a radius of less than 30 mm.

If installed, disconnect the instrument panel center reinforcement fibre optic cables.

- Disconnect the electrical connector.

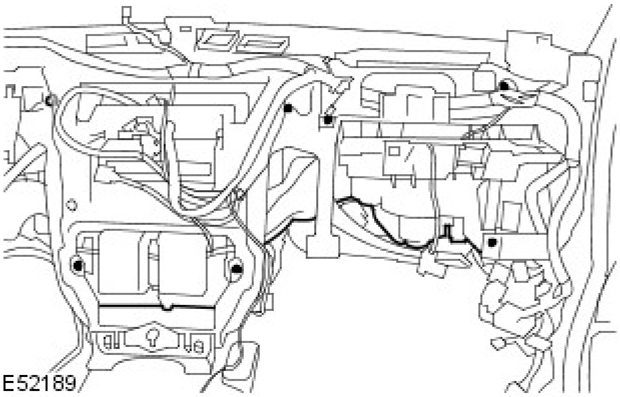


15. Remove the heater housing center ducts.



16. Disconnect the steering column intermediate shaft from the steering column.

- Note the fitted position.
- Remove the special bolt and discard the nut.



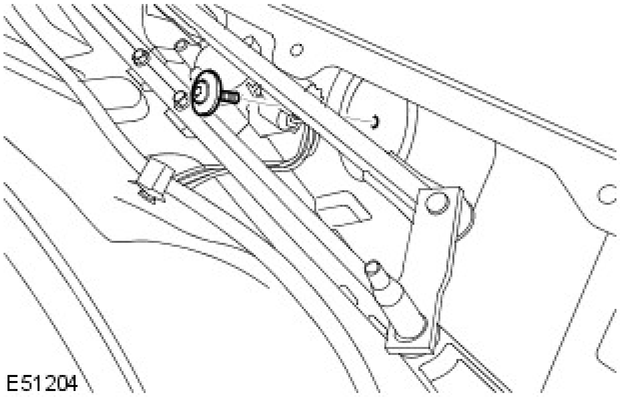
17. Release the heater housing from the instrument panel carrier.

- Remove the 7 Torx screws.

18. Remove the plenum chamber panel.

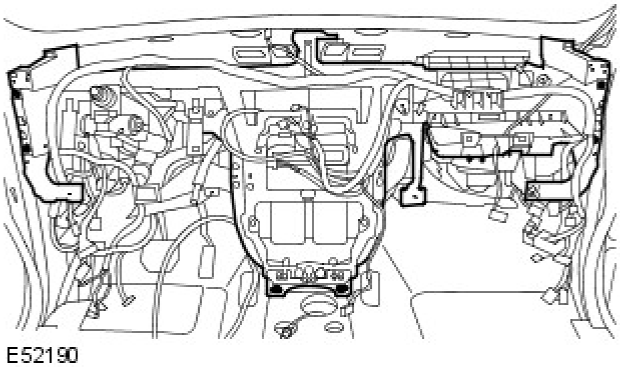
For additional information, refer to: Plenum Chamber (412-01 Air Distribution and Filtering, Removal and Installation).

19. Remove the instrument panel carrier to bulkhead Torx bolt.



20. With assistance, remove the instrument panel.

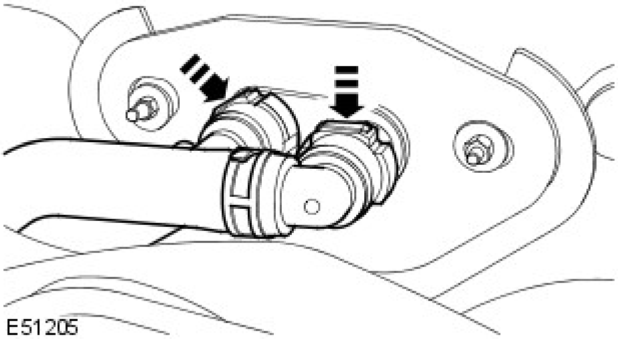
- Remove the 6 Torx bolts.



21. ⚠ CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

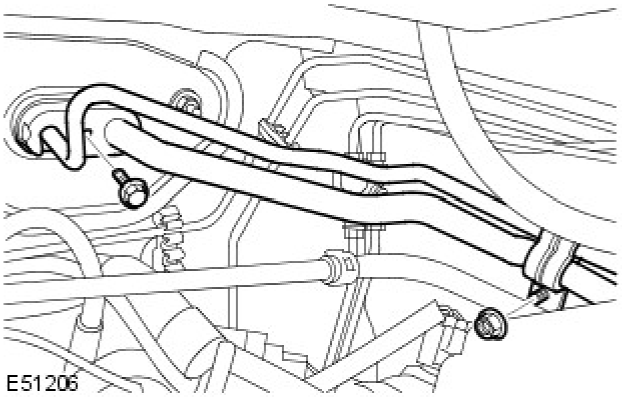
Disconnect 2 heater hoses from the bulkhead.

- Release the 2 clips.



22. Release 2 A/C lines from the body.

- Remove the nut.

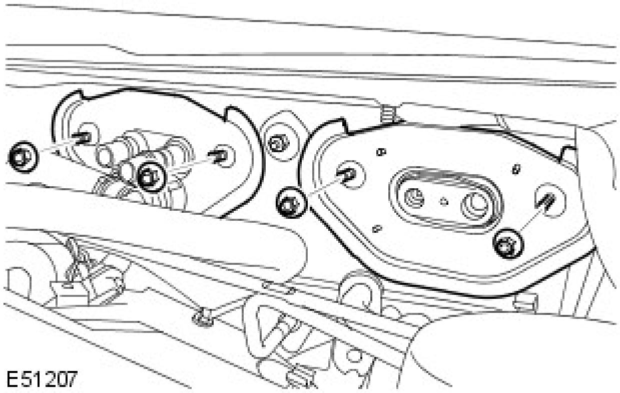


E51206

23. ⚠ CAUTION: Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Release 2 A/C lines from the bulkhead.

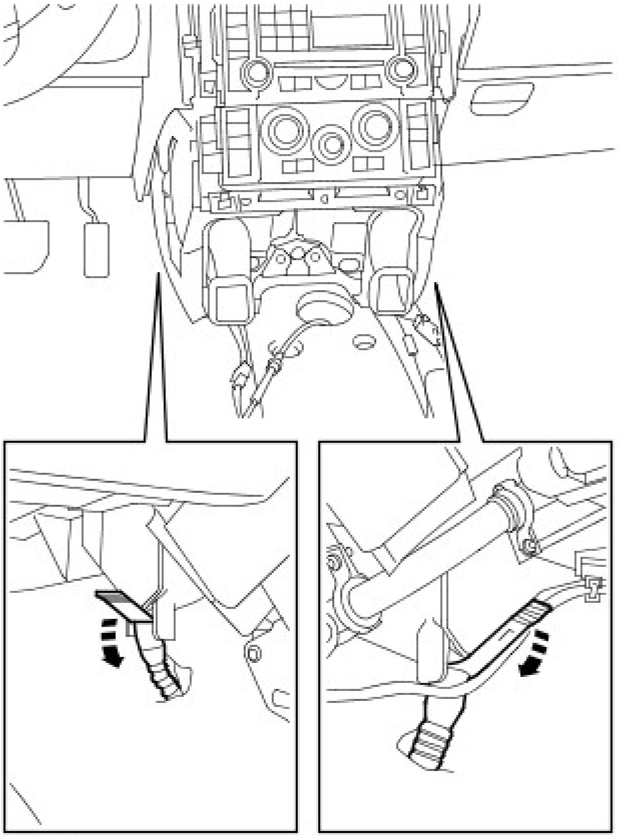
- Remove the bolt.
- Remove and discard the O-ring seals.



E51207

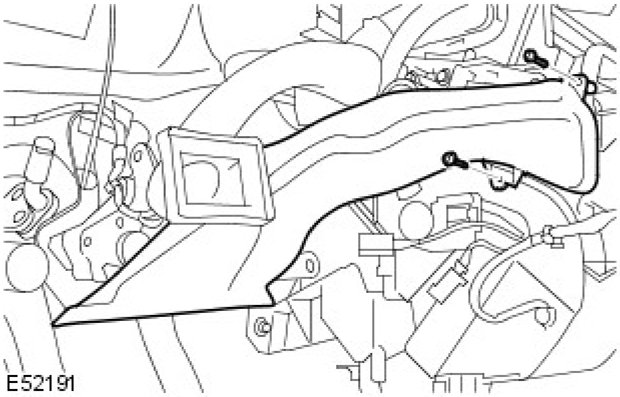
24. Remove the 2 adapter panels.

- Remove the 4 nuts.



E51199

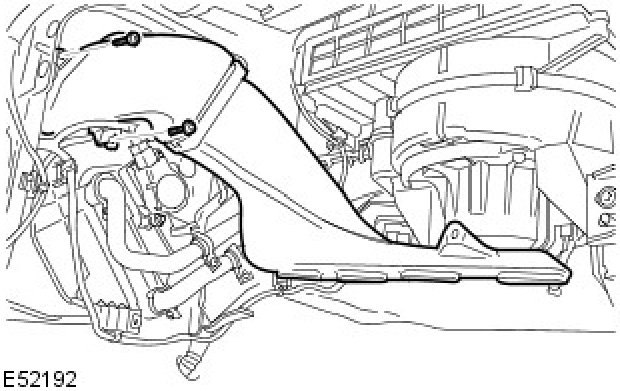
25. Disconnect 2 drain tubes from the heater housing.



E52191

26. Remove the driver side footwell duct.

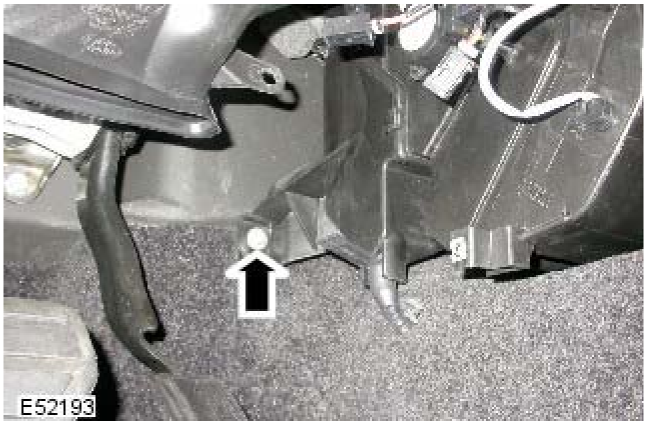
- Remove the 2 Torx screws.



E52192

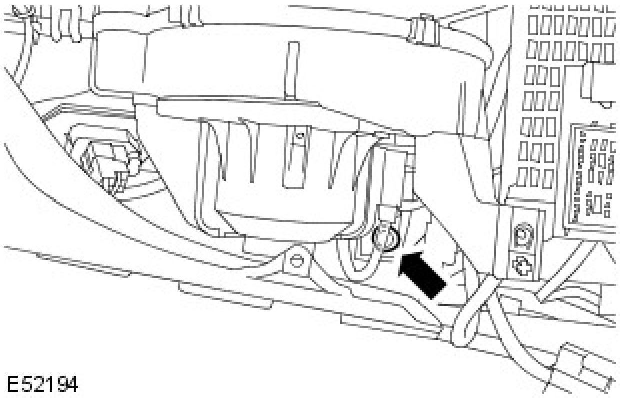
27. Remove the passenger side footwell duct.

- Remove the 2 Torx screws.



E52193

28. Driver side: Remove the heater housing to bulkhead Torx bolt.



E52194

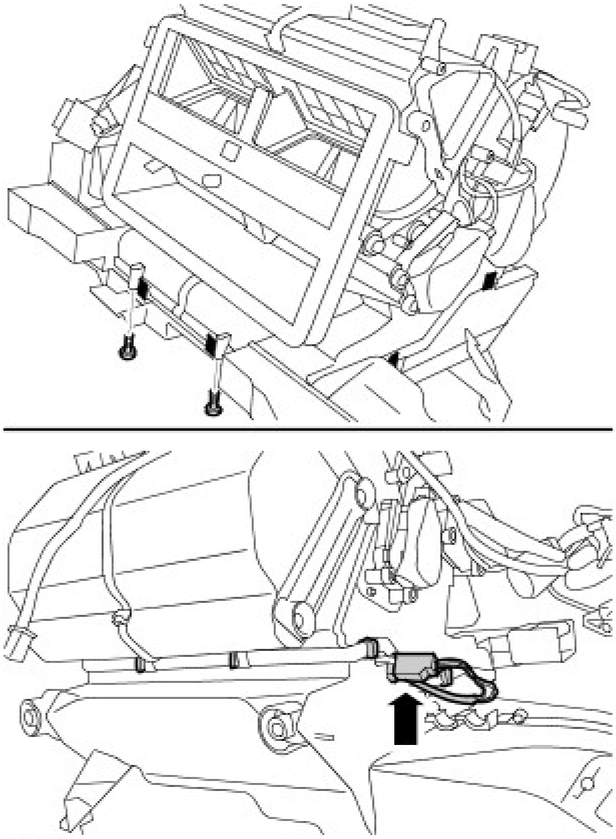
29. Passenger side: Remove the heater housing to bulkhead Torx bolt.

30. Remove the heater housing.

31. Disconnect the evaporator core temperature sensor electrical connector.

32. Release the heater core housing.

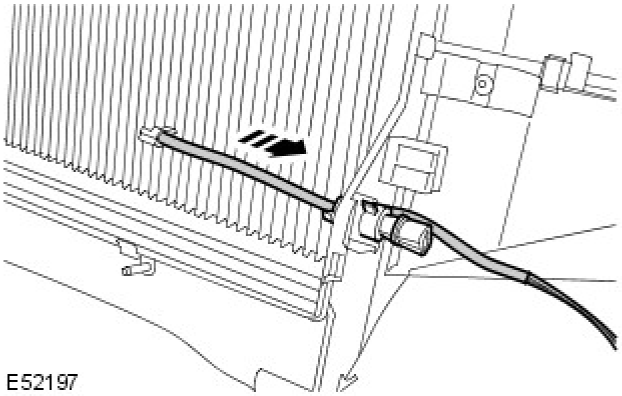
- Remove the 2 screws.
- Remove the 8 clips.



E52196

33. Remove the evaporator core.

- Release the temperature sensor.



E52197

Installation

1. Install the evaporator core.

- Secure the temperature sensor.

2. Secure the heater core housing.

- Install the clips.
- Tighten the screws.

3. Connect the temperature sensor electrical connector.

4. Install the heater housing.

5. Passenger side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).

6. Driver side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).

7. Install the footwell ducts.

- Tighten the Torx screws.

8. Connect the drain tubes to the heater housing.

9. Install the adapter panels.

- Tighten the nuts to 6 Nm (4 lb.ft).

10. Secure the A/C lines to the bulkhead.

- Clean the components.
- Install new O-ring seals.
- Tighten the bolt to 6 Nm (4 lb.ft).

11. Secure the A/C lines to the body.

- Tighten the nut to 6 Nm (4 lb.ft).

12. Connect the bulkhead heater hoses.

13. With assistance, install the instrument panel.

- Tighten the Torx bolts to 25 Nm (18 lb.ft).

14. Install the instrument panel carrier to bulkhead Torx bolt and tighten to 25 Nm (18 lb.ft).

15. Install the plenum chamber panel.
For additional information, refer to: Plenum Chamber (412-01 Air Distribution and Filtering, Removal and Installation).

16. Secure the heater housing.

- Tighten the screws.

17. Connect the steering column intermediate shaft.

- Install the special bolt and tighten the new nut to 22 Nm (16 lb.ft).

18. Install the heater housing center ducts.

19. Connect the instrument panel center reinforcement fibre optic cables.

20. Connect the instrument panel center reinforcement electrical connectors.

21. Connect the CJB electrical connectors.

22. Connect the heater motor electrical connector.

23. Connect the electrical connectors to the passenger side lower A-pillar.

24. Connect the ground cables to the passenger side lower A-pillar.

- Tighten the nuts to 10 Nm (7 lb.ft).

25. Connect the electrical connectors to the driver side lower A-pillar.

26. Connect the ground cables to the driver side lower A-pillar.

- Tighten the nuts to 10 Nm (7 lb.ft).

27. Install the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper

Section (501-12 Instrument Panel and Console, Removal and Installation).

28. Install the front seat.
For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).

29. Recharge the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

30. Refill the cooling system.
For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03B Engine Cooling - V8 4.4L Petrol, General Procedures).

31. Install the engine cover.
For additional information, refer to: Engine Cover - V8 4.4L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).

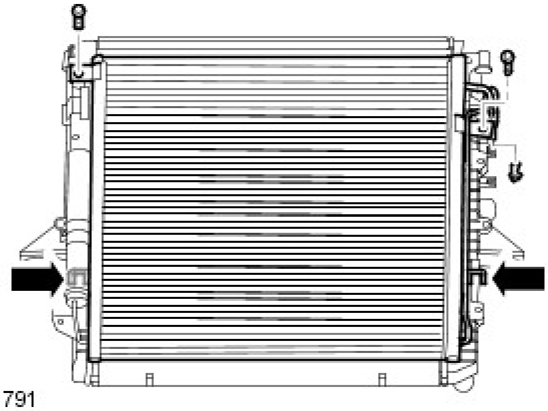
Removal and Installation

Removal

• NOTE: The receiver drier need only be changed under the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure). The system is leaking and refrigerant has been lost to atmosphere. Refrigerant circuit has been open more than 24 hours due to repair.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the radiator assembly.
For additional information, refer to: Radiator (303-03B Engine Cooling - V8 4.4L Petrol, Removal and Installation).



E51791

3. NOTE: The receiver drier need only be changed under the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure). The system is leaking and refrigerant has been lost to atmosphere. Refrigerant circuit has been open more than 24 hours due to repair.

Remove the condenser core.

- Remove the 2 screws.
- Release the 2 clips.
- Remove the bolt.

Installation

1. Install the condenser core.

- Align the condenser core.
- Secure the clips.
- Install the screws.
- Tighten the bolt to 6 Nm (4 lb.ft).

2. Install the radiator assembly.
For additional information, refer to: Radiator (303-03B Engine Cooling - V8 4.4L Petrol, Removal and Installation).

3. Install the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Removal and Installation

Removal

• NOTE: The receiver drier need only be changed under the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure). The system is leaking and refrigerant has been lost to atmosphere. Refrigerant circuit has been open more than 24 hours due to repair.

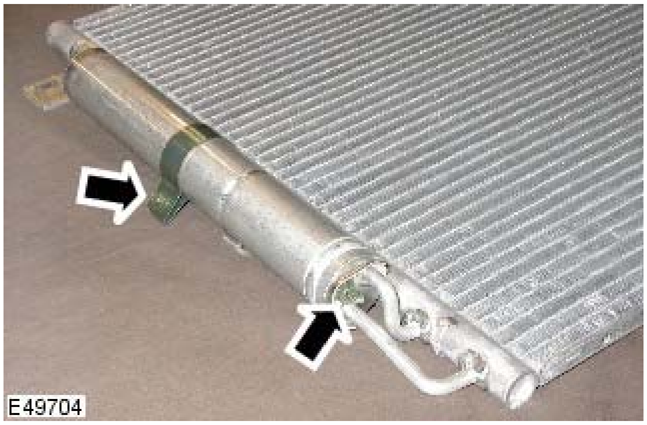
1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the condenser core.
For additional information, refer to: Condenser Core (412-03B Air Conditioning - V8 4.4L Petrol, Removal and Installation).

3. Remove the receiver drier support bracket clamp.

- Loosen the screw.



4. ⚠ CAUTION: Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Remove the receiver drier.

- Remove the bolt.
- Remove the clamp.
- Remove and discard the 2 O-ring seals.

Installation

1. Install the receiver drier.

- Clean the component mating faces.
- Install new O-ring seals.
- Install the clamp.
- Tighten the bolt to 10 Nm (7 lb.ft).

2. Install the condenser core.
For additional information, refer to: Condenser Core (412-03B Air Conditioning - V8 4.4L Petrol, Removal and Installation).

3. Connect the battery ground cable.

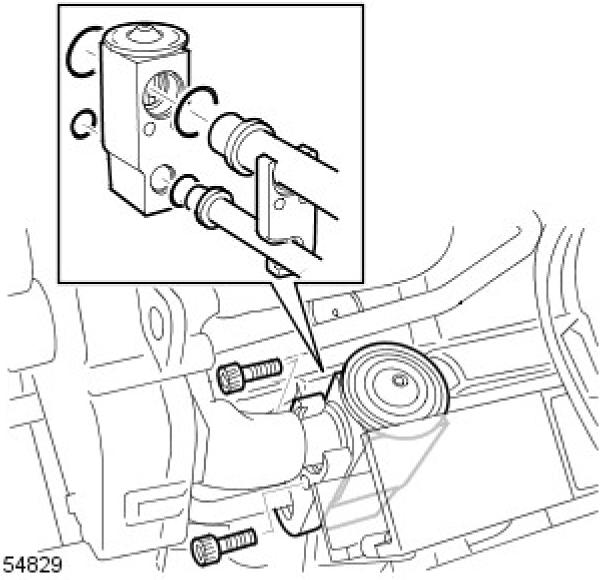
Air Conditioning - V8 4.4L Petrol - Thermostatic Expansion Valve

Removal and Installation

Removal

1. Evacuate the A/C system.
   For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).
2. Remove the instrument panel upper section.
   For additional information, refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).



E54829

3. CAUTION: Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Remove the thermostatic expansion valve.

- Remove the cover.
- Remove the 2 Allen bolts.
- Remove and discard the 4 O-ring seals.

Installation

1. Install the thermostatic expansion valve.
   - Clean the components.
   - Install the new O-ring seals.
   - Tighten the Allen bolts to 5 Nm (4 lb.ft).
   - Install the cover.
2. Install the instrument panel upper section.
   For additional information, refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).
3. Recharge the A/C system.
   For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

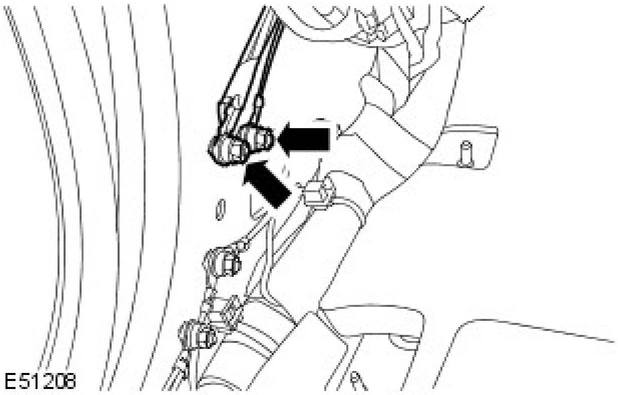
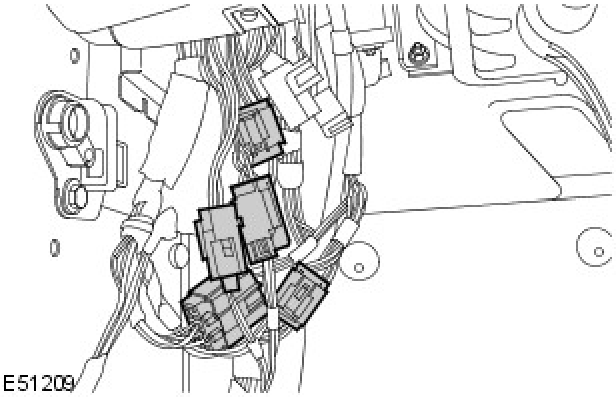
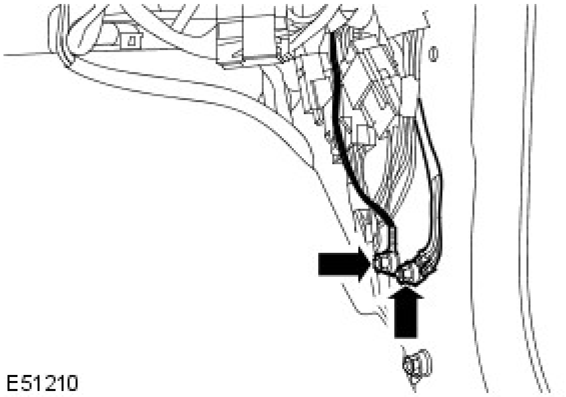
5. Remove the driver side front seat.
   For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).
6. Remove the instrument panel upper section.
7. Release the 3 ground cables from the driver side lower A-pillar.
   - Remove the 2 nuts.



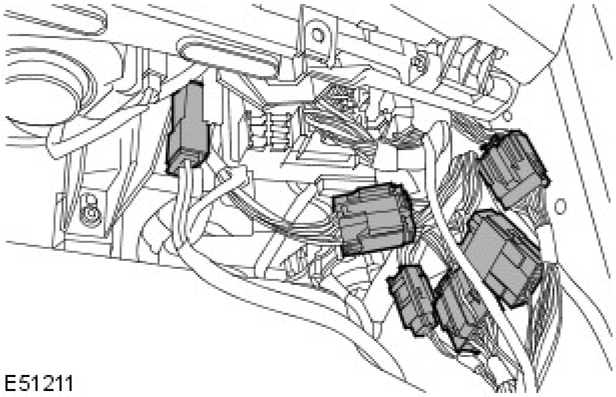
8. Disconnect the 5 electrical connectors from the driver side lower A-pillar.



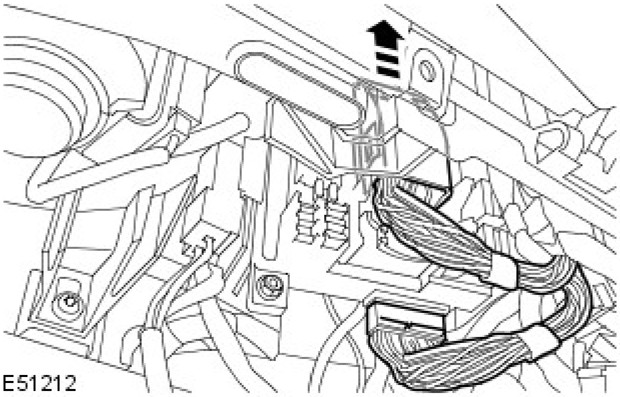


9. Release the 3 ground cables from the passenger side lower A-pillar.
    - Remove the 2 nuts.

10. Disconnect the heater motor electrical connector.

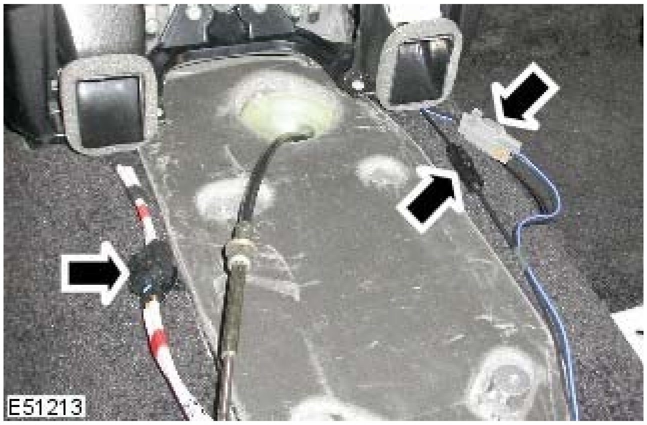


11. Disconnect the 5 electrical connectors from the passenger side lower A-pillar.



12. Disconnect 2 central junction box (CJB) electrical connectors.

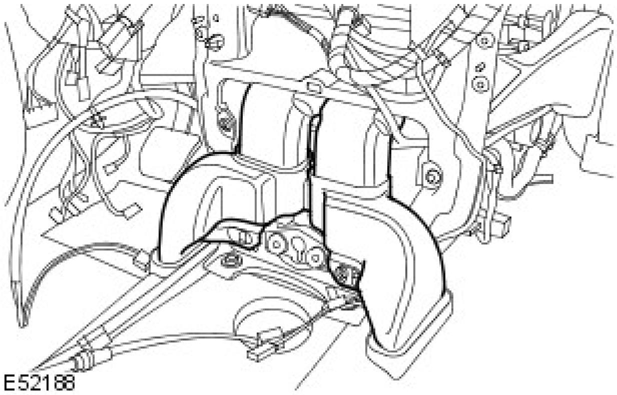
13. Disconnect 2 electrical connectors from the instrument panel center reinforcement.



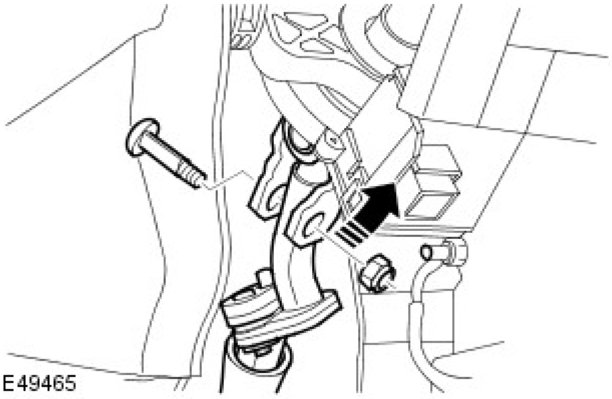
14. ⚠ CAUTION: Cover fibre optic cable connectors to minimise dust ingress and avoid bending the cables in a radius of less than 30 mm.

If installed, disconnect the instrument panel center reinforcement fibre optic cables.

- Disconnect the electrical connector.

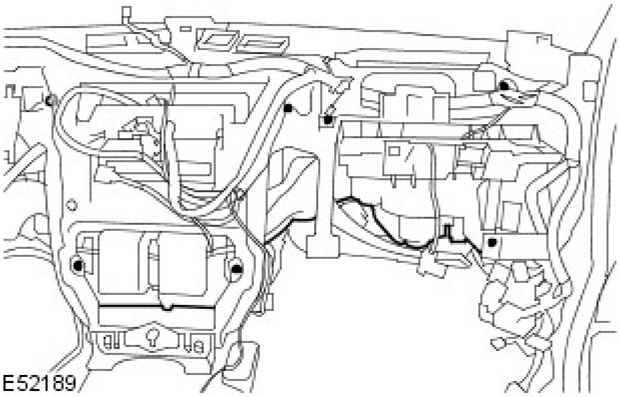


15. Remove the heater housing center ducts.



16. Disconnect the steering column intermediate shaft from the steering column.

- Note the fitted position.
- Remove the special bolt and discard the nut.

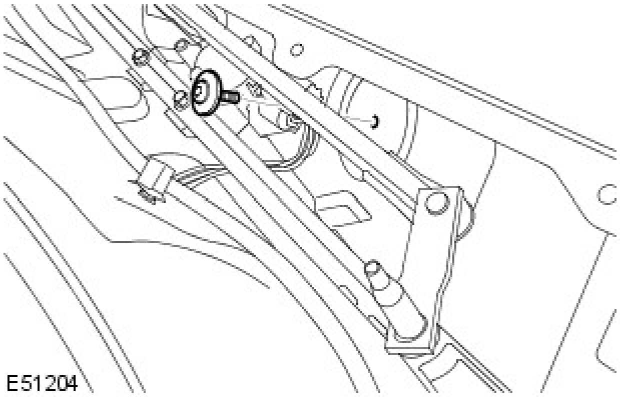


17. Release the heater housing from the instrument panel carrier.

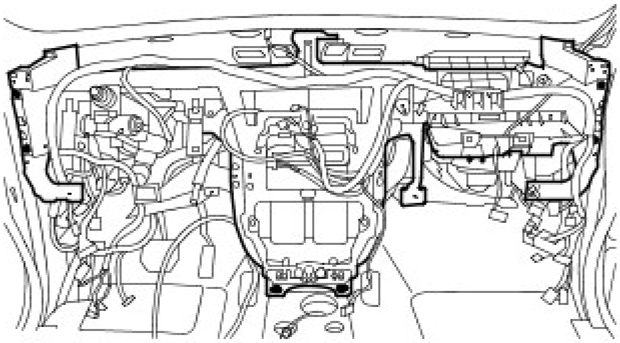
- Remove the 7 Torx screws.

18. Remove the plenum chamber panel.

For additional information, refer to: Plenum Chamber (412-01 Air Distribution and Filtering, Removal and Installation).

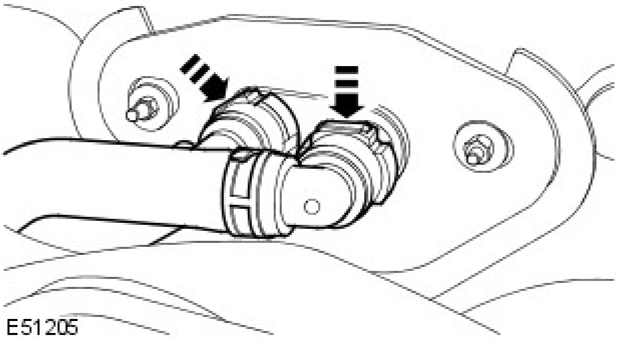


19. Remove the instrument panel carrier to bulkhead Torx bolt.



20. With assistance, remove the instrument panel.

- Remove the 6 Torx bolts.



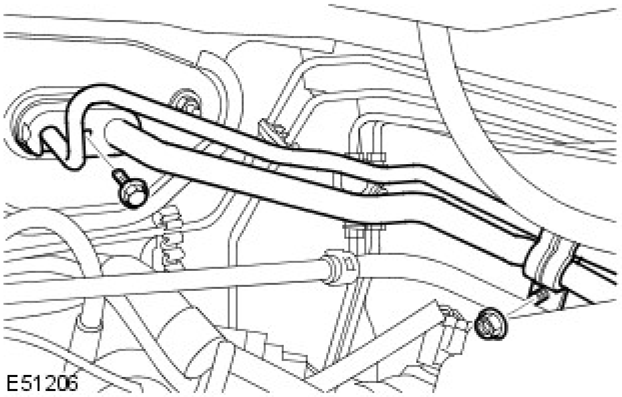
21. ⚠ CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect 2 heater hoses from the bulkhead.

- Release the 2 clips.

22. Release 2 A/C lines from the body.

- Remove the nut.

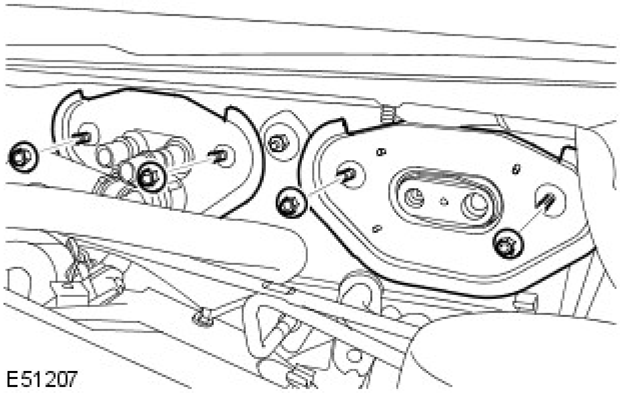


E51206

23. ⚠CAUTION: Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Release 2 A/C lines from the bulkhead.

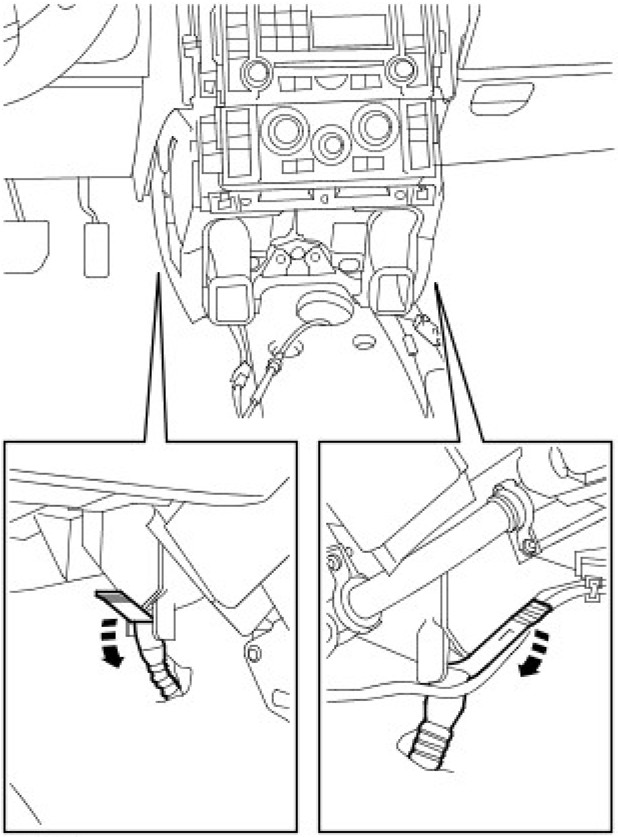
- Remove the bolt.
- Remove and discard the O-ring seals.



E51207

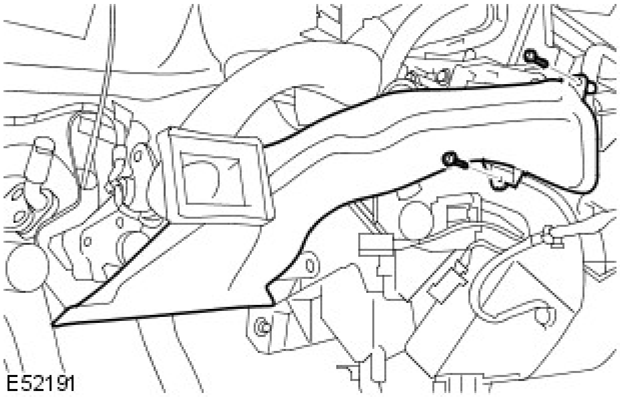
24. Remove the 2 adaptor panels.

- Remove the 4 nuts.



E51199

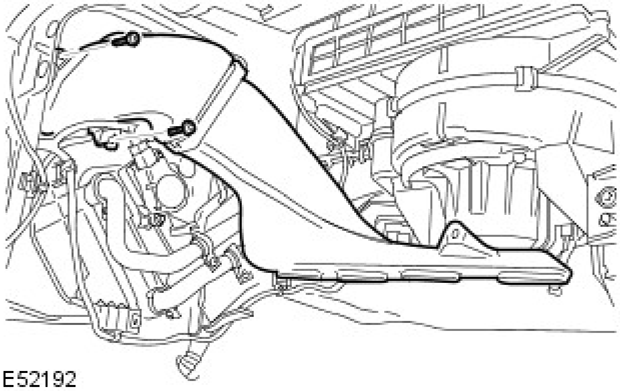
25. Disconnect 2 drain tubes from the heater housing.



E52191

26. Remove the driver side footwell duct.

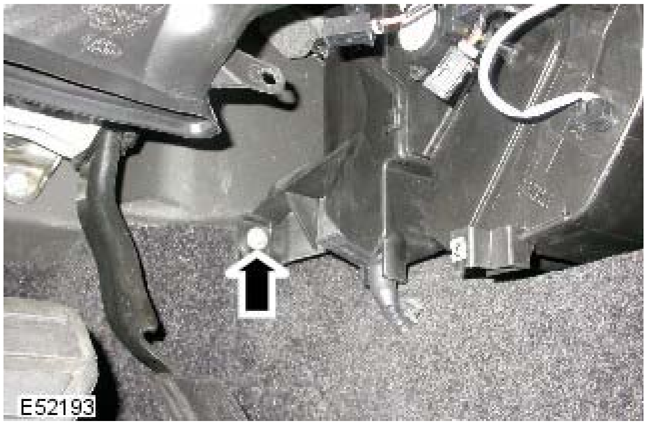
- Remove the 2 Torx screws.



E52192

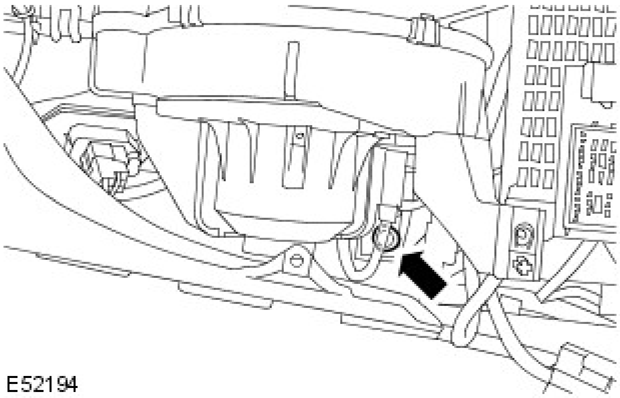
27. Remove the passenger side footwell duct.

- Remove the 2 Torx screws.



E52193

28. Driver side: Remove the heater housing to bulkhead Torx bolt.



E52194

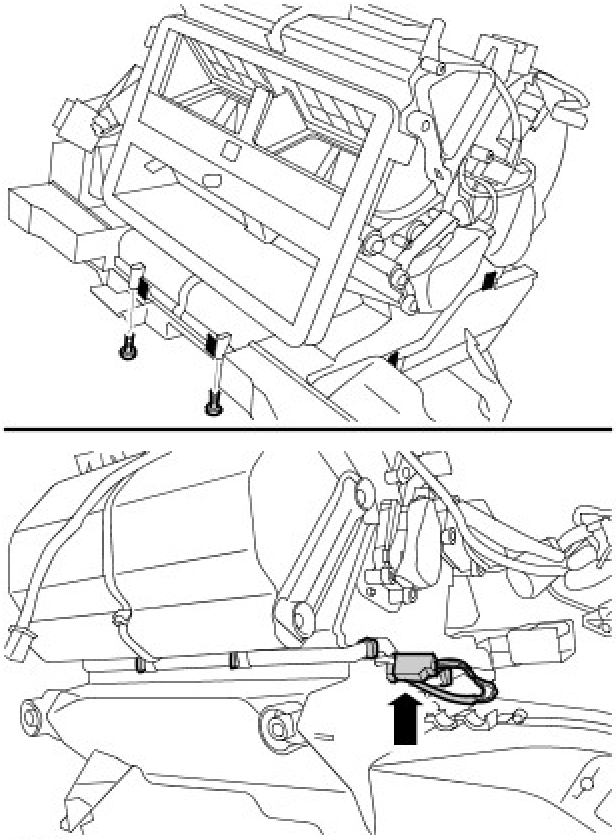
29. Passenger side: Remove the heater housing to bulkhead Torx bolt.

30. Remove the heater housing.

31. Disconnect the evaporator core temperature sensor electrical connector.

32. Release the heater core housing.

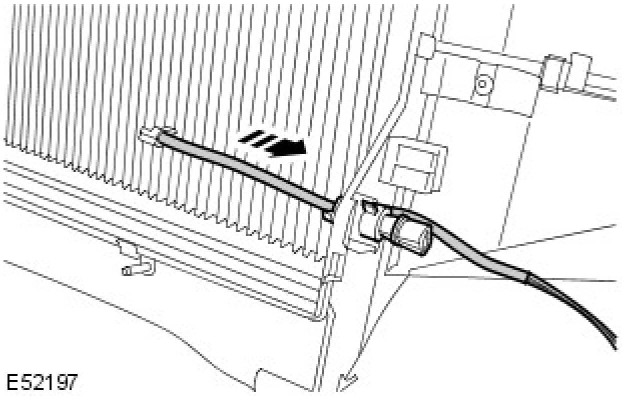
- Remove the 2 screws.
- Remove the 8 clips.



E52196

33. Remove the evaporator core.

- Release the temperature sensor.



E52197

Installation

1. Install the evaporator core.

- Secure the temperature sensor.

2. Secure the heater core housing.

- Install the clips.
- Tighten the screws.

3. Connect the temperature sensor electrical connector.

4. Install the heater housing.

5. Passenger side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).

6. Driver side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).

7. Install the footwell ducts.

- Tighten the Torx screws.

8. Connect the drain tubes to the heater housing.

9. Install the adaptor panels.

- Tighten the nuts to 6 Nm (4 lb.ft).

10. Secure the A/C lines to the bulkhead.

- Clean the components.
- Install new O-ring seals.
- Tighten the bolt to 6 Nm (4 lb.ft).

11. Secure the A/C lines to the body.

- Tighten the nut to 6 Nm (4 lb.ft).

12. Connect the bulkhead heater hoses.

13. With assistance, install the instrument panel.

- Tighten the Torx bolts to 25 Nm (18 lb.ft).

14. Install the instrument panel carrier to bulkhead Torx bolt and tighten to 25 Nm (18 lb.ft).

15. Install the plenum chamber panel.
For additional information, refer to: Plenum Chamber (412-01 Air Distribution and Filtering, Removal and Installation).

16. Secure the heater housing.

- Tighten the screws.

17. Connect the steering column intermediate shaft.

- Install the special bolt and tighten the new nut to 22 Nm (16 lb.ft).

18. Install the heater housing center ducts.

19. Connect the instrument panel center reinforcement fibre optic cables.

20. Connect the instrument panel center reinforcement electrical connectors.

21. Connect the CJB electrical connectors.

22. Connect the heater motor electrical connector.

23. Connect the electrical connectors to the passenger side lower A-pillar.

24. Connect the ground cables to the passenger side lower A-pillar.

- Tighten the nuts to 10 Nm (7 lb.ft).

25. Connect the electrical connectors to the driver side lower A-pillar.

26. Connect the ground cables to the driver side lower A-pillar.

- Tighten the nuts to 10 Nm (7 lb.ft).

27. Install the instrument panel upper section.

28. Install the front seat.

For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).

29. Recharge the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

30. Refill the cooling system.
For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03B Engine Cooling - V8 4.4L Petrol, General Procedures).

31. Install the engine cover.
For additional information, refer to: Engine Cover - V8 4.4L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).

Published: 22-Jun-2011

Air Conditioning - V8 4.4L Petrol - Air Conditioning (A/C) Compressor Pulley

Removal and Installation

Removal

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

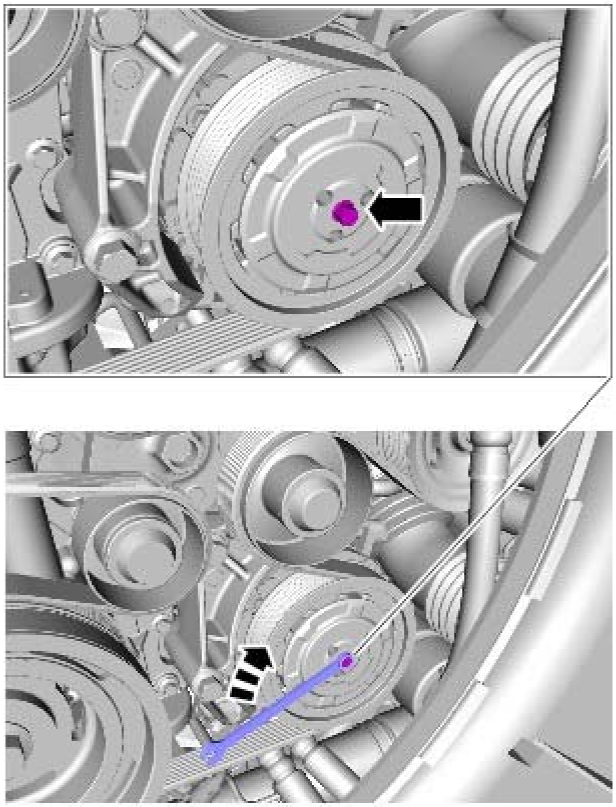
- NOTE: Components removed for clarity.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the cooling fan.
For additional information, refer to: Cooling Fan (303-03A Engine Cooling - V8 S/C 4.2L Petrol, Removal and Installation).

3. Using a suitable tool, release the hub locking stud.

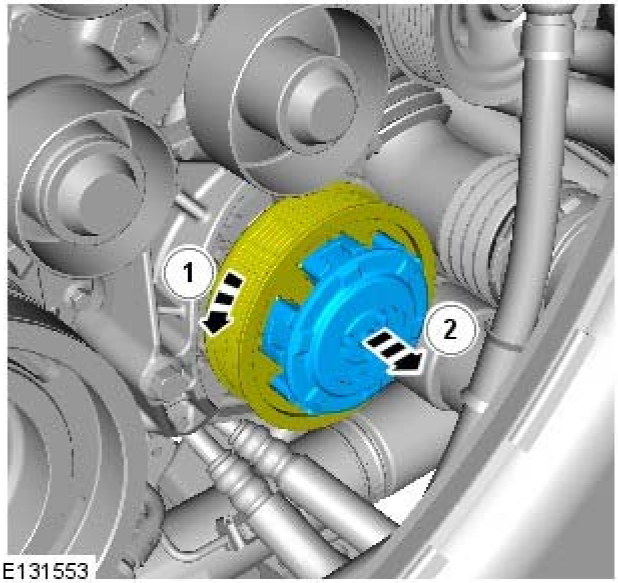
- Rotate the fixing clockwise to release the hub.
- If required, use a suitable tool to prevent the hub from rotating.



E131552

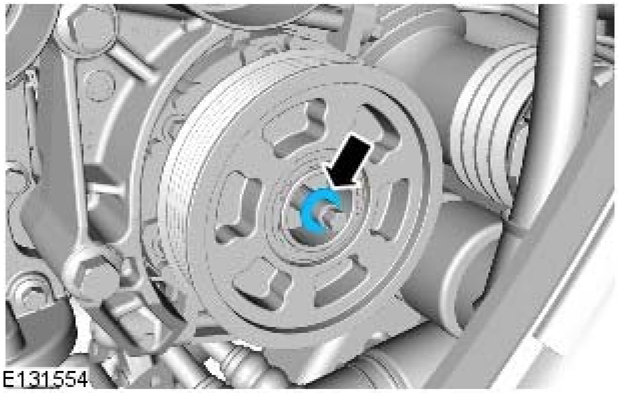
4. NOTE: Using a 3/8 square drive wrench, rotate the tensioner counter clockwise.

Release the accessory drive belt from the A/C compressor pulley.

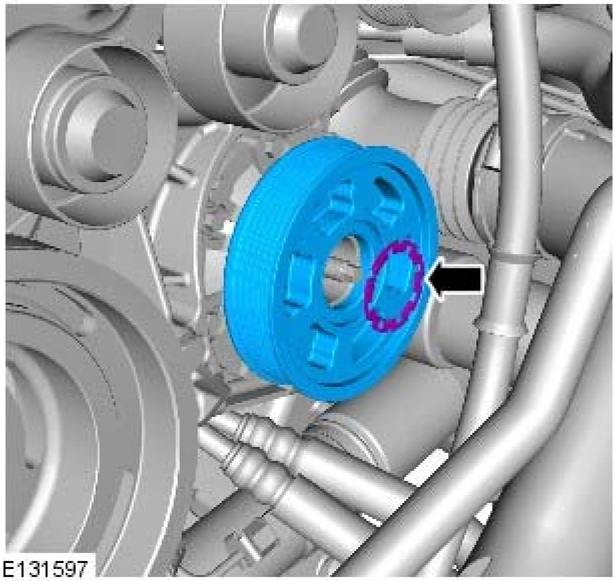


5. Remove and discard the hub assembly.

- Rotate the pulley counter-clockwise, until the hub is released from the pulley.
- Discard the rubber dampers.



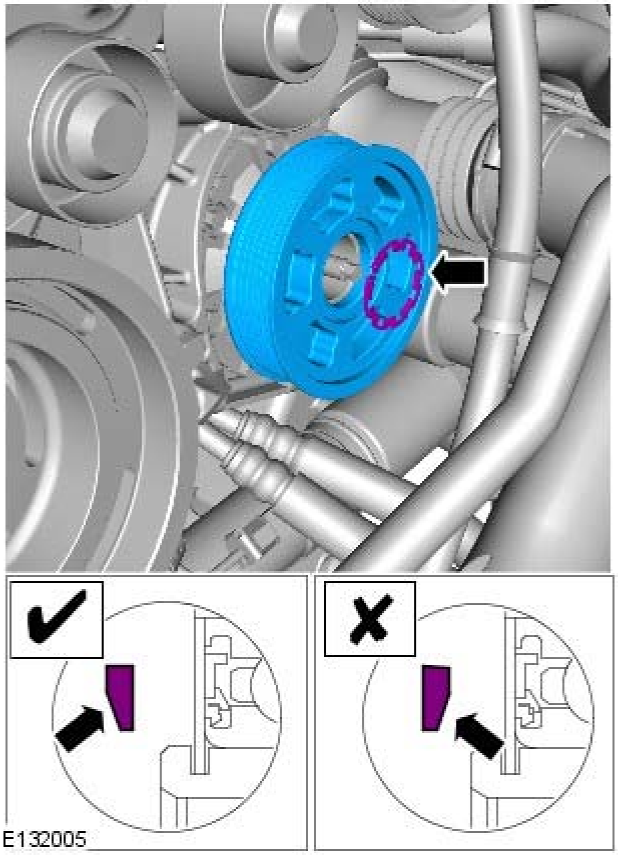
6. Remove and discard the spacer.



7. Remove and discard the drive pulley.

- Remove and discard the circlip.
- Clean the compressor mating surface.

Installation



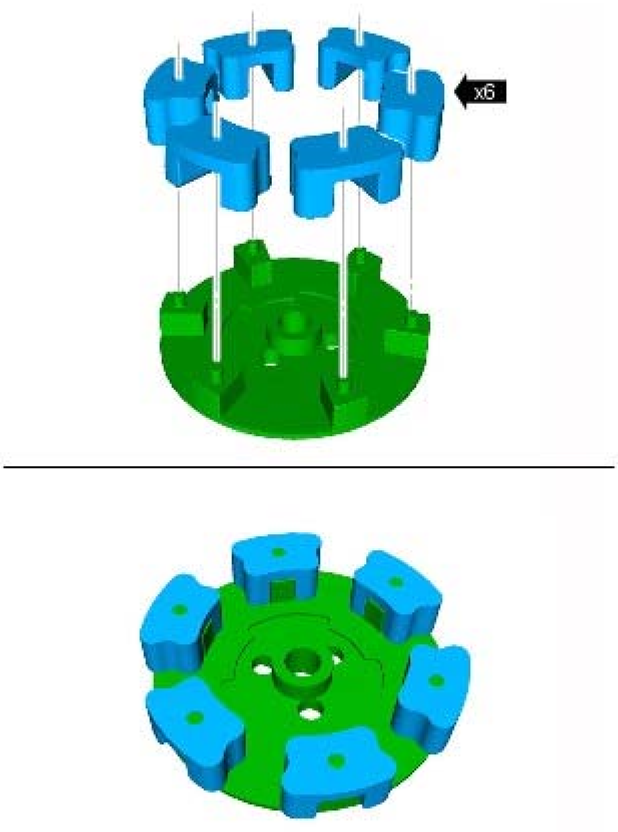
1. ⚠CAUTION: Make sure the circlip is fitted in the correct orientation.

   Install the drive pulley.

   - Install the circlip.

2. Install the spacer.

   - Make sure the spacer is fully seated.



E131556

3. Install the 6 rubber dampers to the hub assembly.

- Make sure the dampers are installed in the correct orientation.

4. NOTE: Apply a suitable water based lubricant to the rubber dampers and to the mating surfaces on pulley.

Install the hub assembly.

- Push the hub assembly onto the pulley, and rotate clockwise to screw it onto the compressor shaft.

5. NOTE: Tighten counterclockwise.

Using a suitable tool, tighten the hub locking stud.

- Prevent the pulley rotating by hand.
- Tighten to 3.5 Nm (2.6 lb.ft)

6. Install the auxiliary drive belt.

7. Install the cooling fan.
For additional information, refer to: Cooling Fan (303-03A Engine Cooling - V8 S/C 4.2L Petrol, Removal and Installation).

8. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Lubricant

Item	Specification
Compressor oil	Denso ND-8 PAG oil
Total system capacity	130 cm³ (4.5 fluid ounces)
Additional amount of oil to be added to system if a component is replaced:	
Condenser	40 cm³ (1.4 fluid ounces)
Evaporator	40 cm³ (1.4 fluid ounces)
Pipe or hose	10 cm³ (0.35 fluid ounces)

System Refrigerant Specification / Capacity

Item	Specification
Refrigerant type	R134A
Total system capacity	550 grammes (19.4 ounces)

General Specification

Item	Description
Compressor:	
Make	Denso
Type	7SEU17
Sensor locations:	
Ambient temperature sensor	At the front of the vehicle
Smog sensor	At the front of the vehicle adjacent to the ambient temperature sensor
ICS/humidity sensor	On the instrument panel adjacent to the steering column
Solar sensor	On the vehicle centre line on top of the instrument panel
Pressure transducer	In A/C line - LH side of engine compartment

Torque Specifications

Description	Nm	lb-ft
Compressor mounting bolts	23	17
Receiver/drier mounting bolts	10	7
Refrigerant line bolts	6	4
Radiator bolts	25	18
A/C pipe to condenser bolts	6	4
Coolant expansion tank bolts	10	7
Heater housing to bulkhead Torx bolts	6	4
Adaptor panel nuts	6	4
Air conditioning lines to bulkhead bolt	6	4
Air conditioning lines to body nut	6	4
Instrument panel Torx bolts	25	18
Instrument panel carrier to bulkhead Torx bolt	25	18
* Steering column intermediate shaft nut	22	16
Ground cables to passenger side lower A-pillar nuts	10	7
Ground cables to driver side lower A-pillar nuts	10	7
Pressure transducer	10	7
Power steering pump mounting bracket bolts	25	18
Supercharger radiator bolts	10	7
Thermostatic expansion valve	5	4
High pressure pipe to compressor bolt	9	7
Low pressure pipe to compressor	9	7

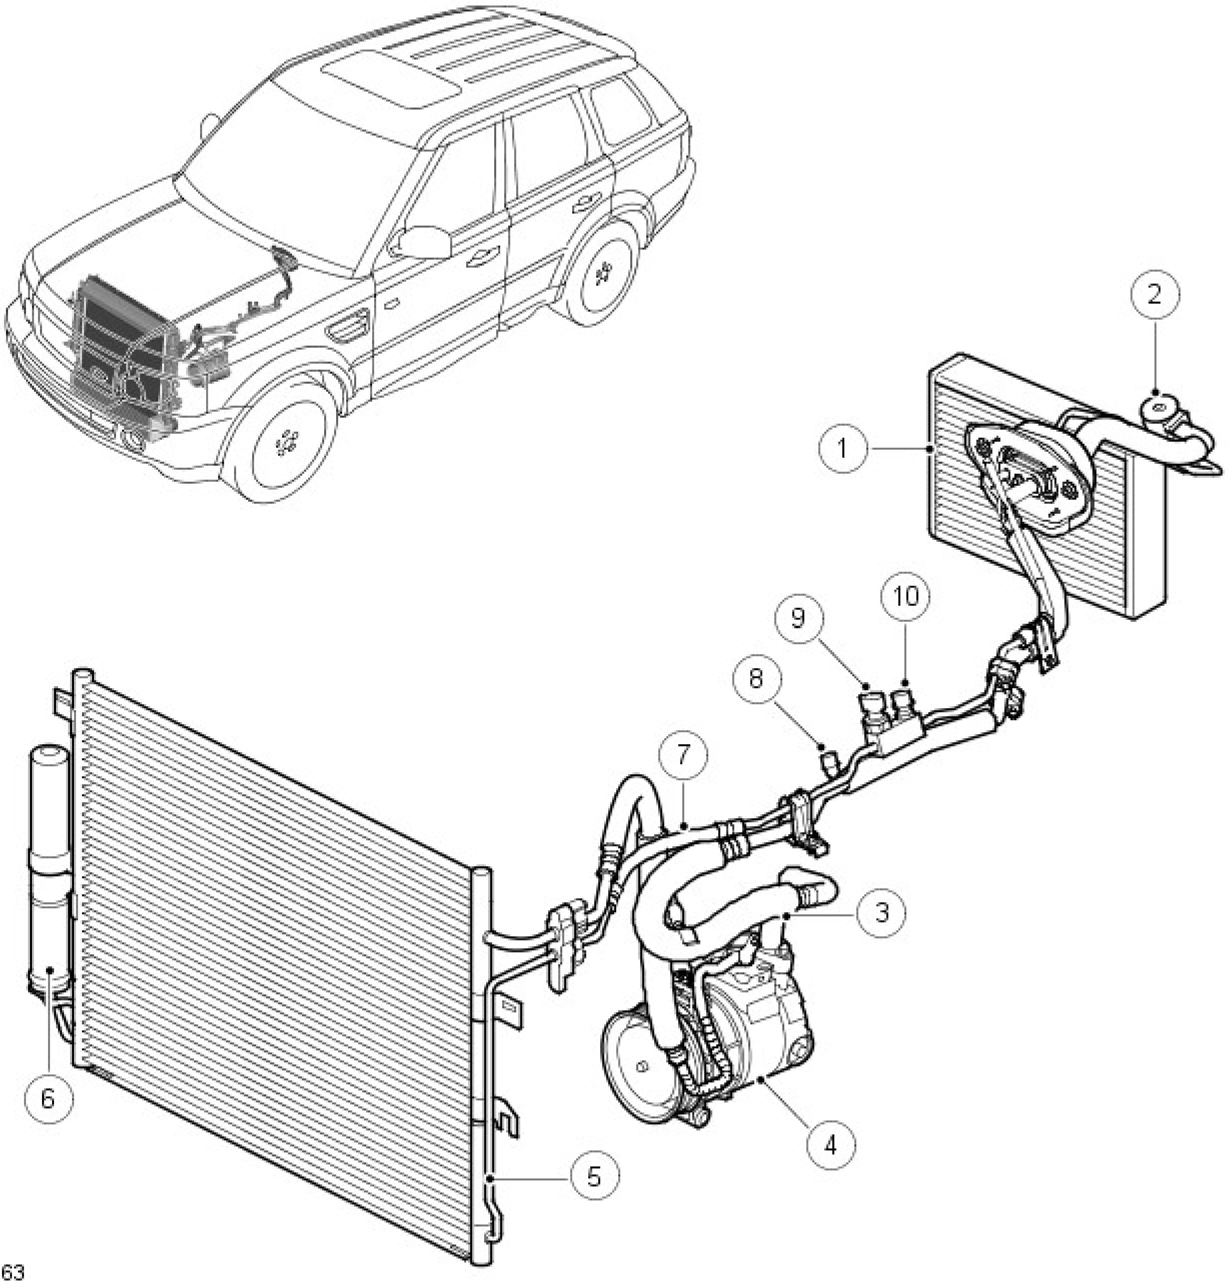
Air Conditioning - TDV6 2.7L Diesel - Air Conditioning

Description and Operation

COMPONENT LOCATIONS



Item	Part Number	Description
1	-	Evaporator
2	-	Thermostatic expansion valve
3	-	Low pressure line
4	-	air conditioning (A/C) compressor
5	-	Condenser
6	-	Receiver drier
7	-	High pressure line
8	-	Low pressure servicing connection
9	-	Refrigerant pressure sensor (reference)
10	-	High pressure servicing connection

For additional information, refer to: Air Conditioning (412-03A Air Conditioning - V8 S/C 4.2L Petrol, Description and Operation).

Published: 11-May-2011

Air Conditioning - TDV6 2.7L Diesel - Air Conditioning

Diagnosis and Testing

Overview

Due to the different equipment available in dealers, there are no specifics as to the connection of gauge sets or charging and recovery stations. Refer to the instructions for the equipment in use in your own workshop.

For information on the description and operation of the system, refer to section 412-03 - Air Conditioning in the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
• Auxiliary drive belt condition and tension • Compressor condition and installation • Condenser condition and installation/blockage • Air conditioning hoses and pipes • Receiver/drier condition and installation • Cooling fan	• Fuses • Harnesses • Electrical connector(s) • Relays • Sensors • Control panel(s) • Air conditioning compressor

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom chart

Symptom chart

Symptom	Possible causes	Action
Poor or no cooling	• Drive belt fault • Compressor fault • Distribution motor/flap fault • Refrigerant leak • In-vehicle temperature sensor fault • Refrigerant pressure sensor fault	Check the drive belt condition and tension (see visual inspection). Check the compressor operation (observe the compressor as the engine is idling with the air conditioning switched on. If the compressor runs erratically or does not run. Carry out the distribution motor self test. Refer to the relevant workshop manual section. Check for sensor DTCs. Refer to the DTC index. Check the refrigerant system using your charging station.
Noise	• Drive belt fault • Compressor fault • Compressor pulley fouling • Refrigerant overcharged	Confirm the air conditioning as the source of the noise by listening for the noise with the air conditioning switched off. Refer to the relevant workshop manual section. Check the refrigerant system using your charging station.
Water entry into cabin	• Heater matrix leak • Blocked evaporator drain tubes	Check for coolant loss. Pressure test the cooling system as necessary. Check and clear the evaporator drain tubes as necessary.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible cause	Action
B1A6111	Cabin Temperature Sensor	● Ambient air temperature sensor signal short circuit to ground	Refer to the electrical guides and check the ambient air temperature sensor circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A6115	In-vehicle Temperature Sensor Signal	● Ambient air temperature sensor signal high resistance ● In-vehicle temperature sensor signal short circuit to power	Refer to the electrical guides and check the ambient air temperature sensor circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A6211	Pressure Sensor	● A/C refrigerant pressure sensor signal short circuit to ground	Refer to the electrical guides and check the pressure sensor circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A6215	Pressure Sensor	● A/C refrigerant pressure sensor signal short circuit to power	Refer to the electrical guides and check the pressure sensor circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A7001	Compressor Solenoid +ve Supply	● Refrigerant solenoid valve power circuit short circuit to ground ● Refrigerant solenoid valve power circuit short circuit to power ● Refrigerant solenoid valve over temperature	Refer to the electrical guides and check the refrigerant solenoid circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1B7884	System Pressure	● Pressure signal below allowable range ● Refrigerant leak	Check for pressure sensor DTcs. Check the refrigerant system using a suitable charging station.
B1B7885	System Pressure	● Pressure signal above allowable range ● Condenser fault ● Cooling fan fault	Check for pressure sensor DTcs. Check the condenser for damage/restriction and the cooling fan operation. Check the refrigerant system using a suitable charging station.

Air Conditioning - TDV6 2.7L Diesel - Air Conditioning (A/C) Compressor

Removal and Installation

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.
   For additional information, refer to: Jacking (100-02, Description and Operation).

2. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

3. Remove the engine cover.
   For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

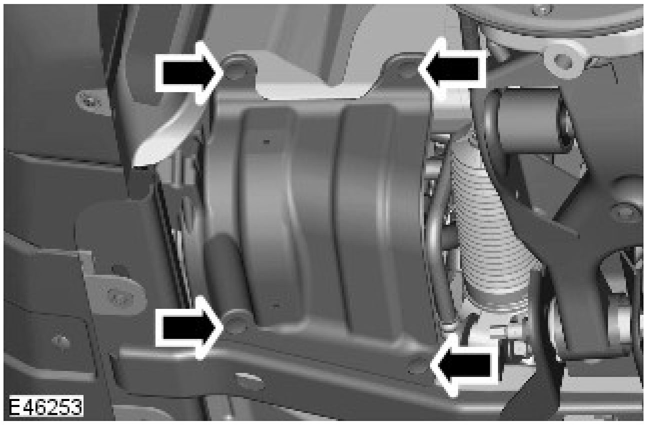
4. Recover the air conditioning (A/C) refrigerant.
   For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

5. Remove the auxiliary battery tray.
   For additional information, refer to: Auxiliary Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).

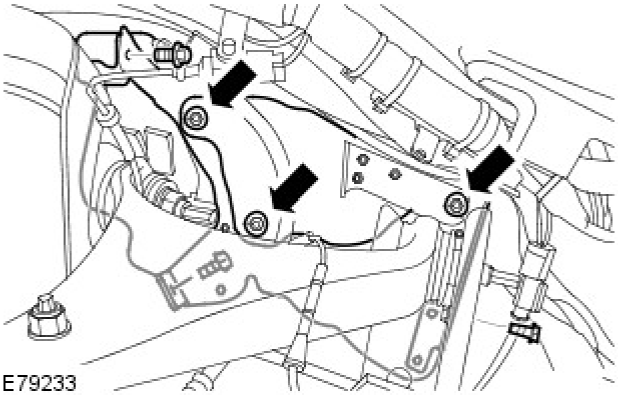
6. Remove the accessory drive belt.
   For additional information, refer to: Accessory Drive Belt (303-05C Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

7. Remove the LH front wheel and tire.

8. Remove the front LH fender splash shield.
   For additional information, refer to: Fender Splash Shield (501-02, Removal and Installation).



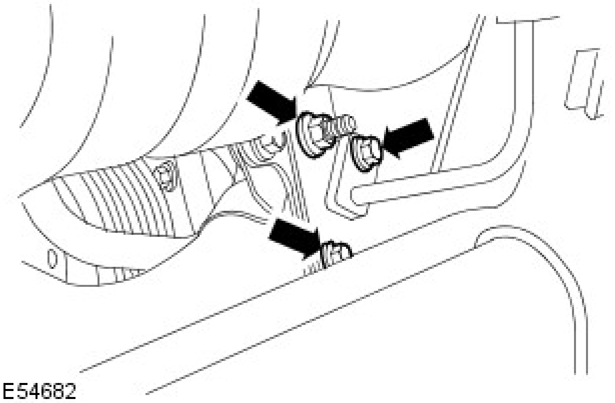
9. Remove the fender splash shield lower trim panel.
   - Remove the 4 clips.



E79233

10. Remove the upper arm and brake line heat shields for access.

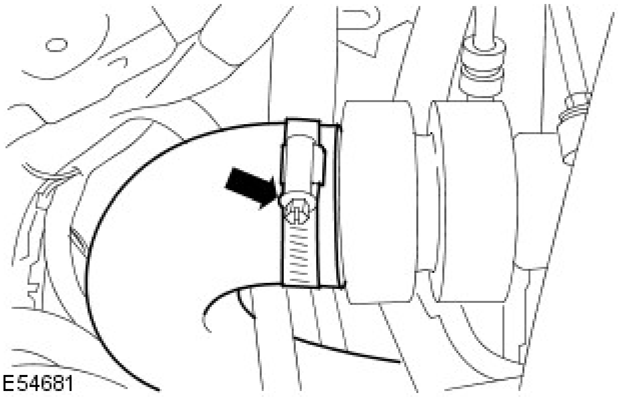
- Remove the 3 nuts.
- Remove the 3 bolts.



E54682

11. Release the charge air cooler inlet pipe.

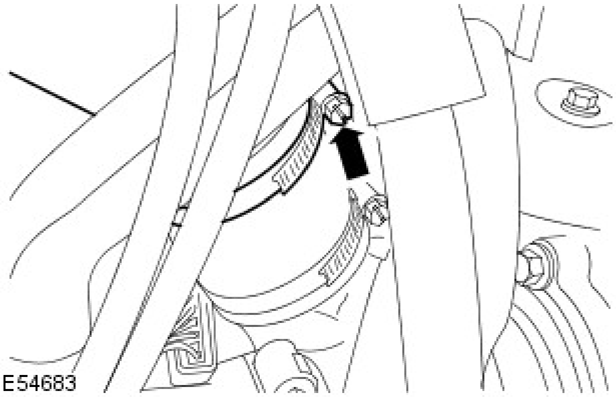
- Remove the two retaining bolts.
- Remove the retaining nut.



E54681

12. Disconnect the charge air cooler inlet hose.

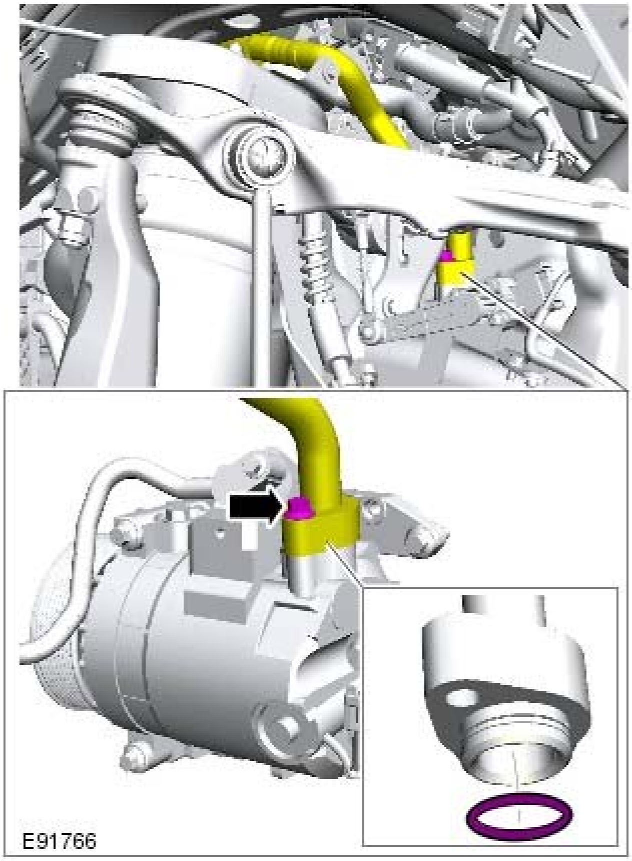
- Loosen the clip.



E54683

13. Disconnect the charge air cooler inlet hose.

- Loosen the clip.



E91766

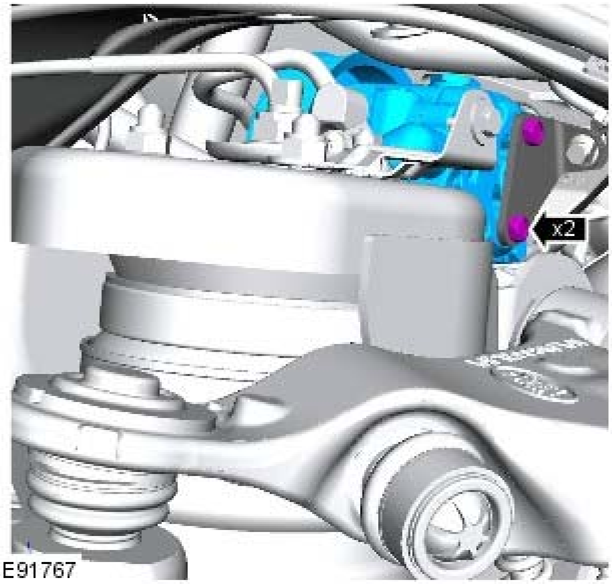
14. CAUTIONS:

⚠ Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

⚠ Care must be taken to avoid damage to the mating surfaces.

Release the A/C low-pressure pipe from the compressor.

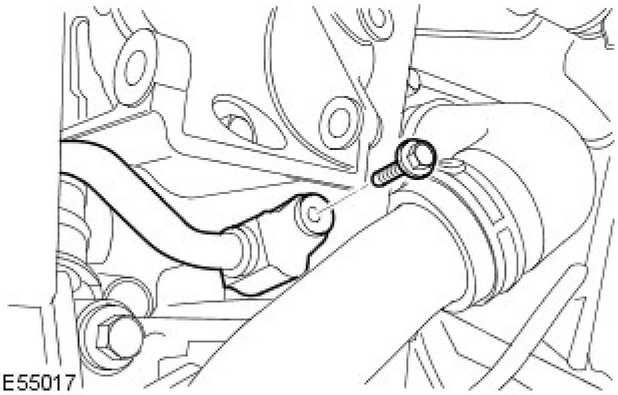
- Remove and discard the O-ring seal.
- Using a suitable tie strap, secure the A/C low-pressure pipe aside.



E91767

15. Release the power steering pump support bracket.

- Reposition the charge air cooler inlet pipe to gain access to the power steering pump retaining bolts.
- Remove the 2 bolts.



16. CAUTIONS:

⚠ Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

⚠ Care must be taken to avoid damage to the mating surfaces.

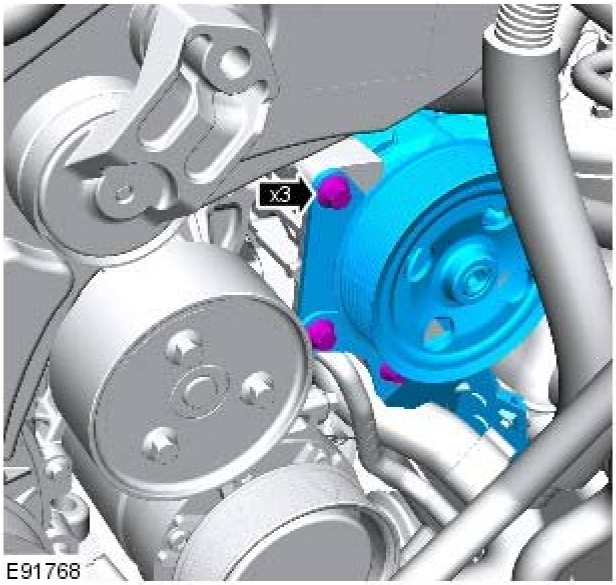
Disconnect the A/C compressor high-pressure pipe.

- Remove the LH retaining bolt.
- Remove and discard the O-ring seal.

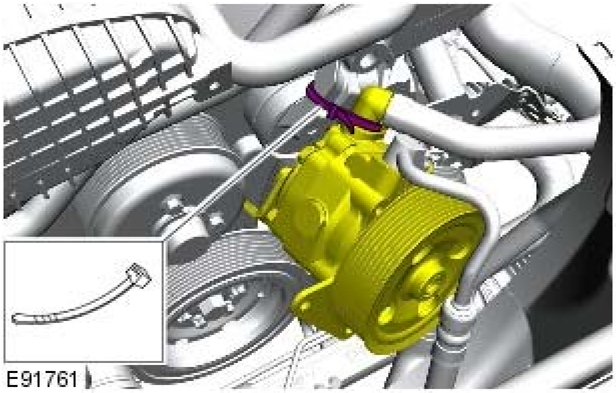
17. Reposition the A/C compressor high-pressure pipe.

18. Release the power steering pump.

- Collect the support bracket.

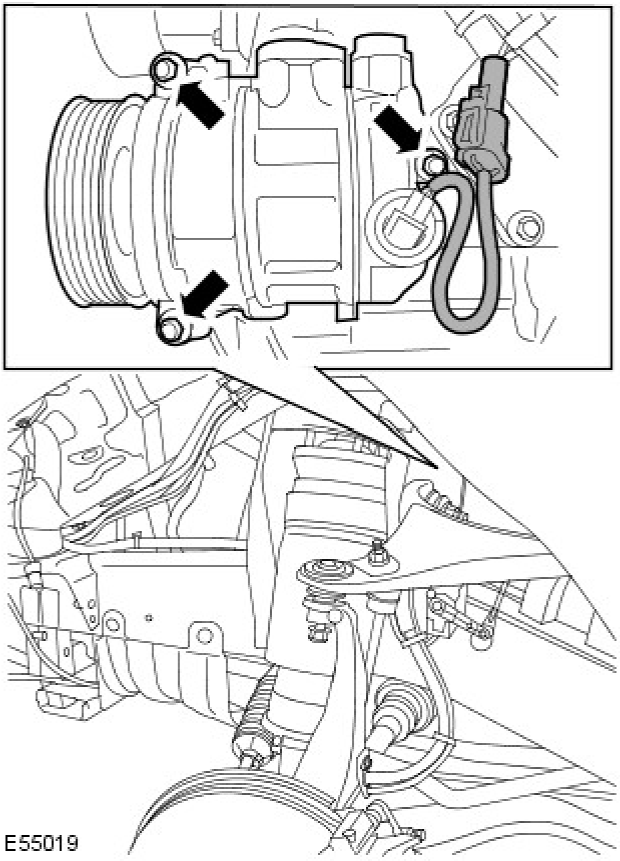


19. Using a suitable tie strap, secure the power steering pump.



20. Remove the A/C compressor.

- Disconnect the A/C compressor electrical connector.
- Remove the three retaining bolts.



Installation

1. ⚠ CAUTION: Lubricate the new seals with clean refrigerant oil.

Install the A/C compressor.

- Install the three retaining bolts.
- Tighten the bolts to 23 Nm (17 lb.ft).
- Connect the A/C compressor electrical connector.

2. Secure the power steering pump.

- Remove and discard the tie strap.
- Install the support bracket.

3. Reposition the A/C compressor high-pressure pipe.

4. Connect the A/C compressor high-pressure pipe.

- Remove the blanking caps from the ports.
- Install a new O-ring seal.
- Tighten the retaining bolt to 9 Nm (7 lb.ft).

5. Install the power steering pump rear bolts.

- Reposition the charge air cooler inlet pipe to gain access to the power steering pump retaining bolts.
- Tighten the bolts to 22 Nm (16 lb.ft).

6. Connect the A/C compressor low-pressure pipe.

- Remove the blanking caps from the ports.
- Install a new O-ring seal.
- Tighten the retaining bolt to 9 Nm (7 lb.ft).

7. Connect the charge air cooler inlet hose.

- Tighten the clips.

8. Secure the charge air cooler inlet pipe.

- Install the two retaining bolts.
- Install the retaining nut.
- Tighten to 10 Nm (7 lb.ft).

9. Install the upper arm and brake line heat shields.

- Install the 3 bolts.
- Install the 3 nuts.

10. Install the fender splash shield lower trim panel.

- Install the 4 clips.

11. Install the front LH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02, Removal and Installation).

12. Install the wheel and tire.

- Tighten nuts to 140 Nm (103 lb.ft).

13. Install the accessory drive belt.
For additional information, refer to: Accessory Drive Belt (303-05C Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

14. Install the auxiliary battery tray.
For additional information, refer to: Auxiliary Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).

15. Recharge the A/C system
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

16. Install the engine cover.
For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

17. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Air Conditioning - TDV6 2.7L Diesel - Evaporator Core

Removal and Installation

Removal

1. Evacuate the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

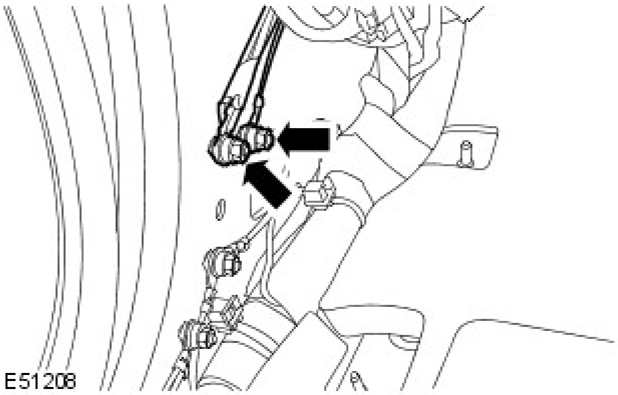
3. Drain the cooling system.
For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03C Engine Cooling - TDV6 2.7L Diesel, General Procedures).

4. Remove the driver side front seat.
For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).

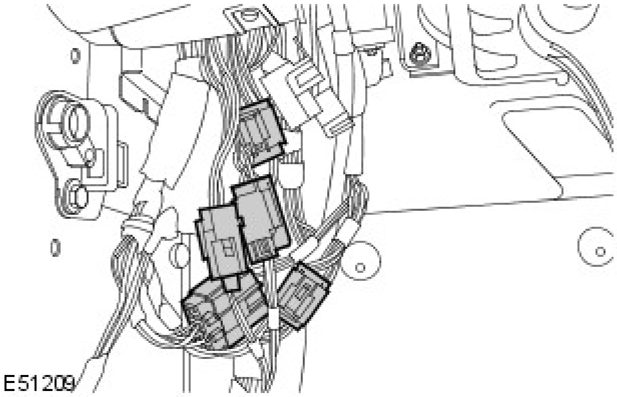
5. Remove the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).

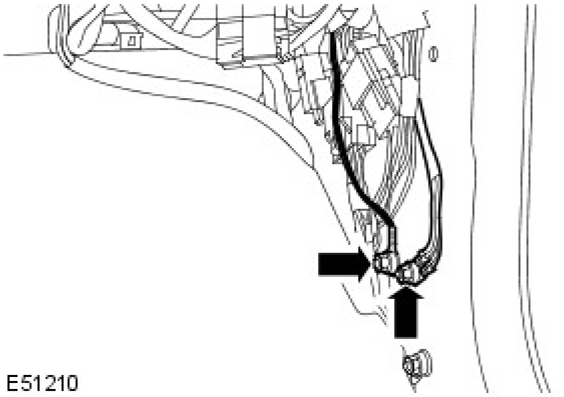
6. Release the 3 ground cables from the driver side lower A-pillar.

- Remove the 2 nuts.



7. Disconnect the 5 electrical connectors from the driver side lower A-pillar.



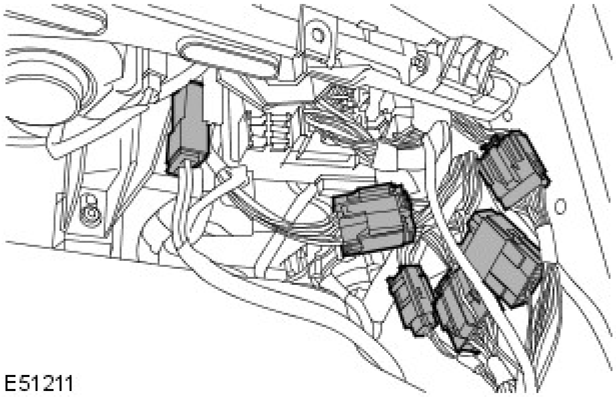


E51210

8. Release the 3 ground cables from the passenger side lower A-pillar.

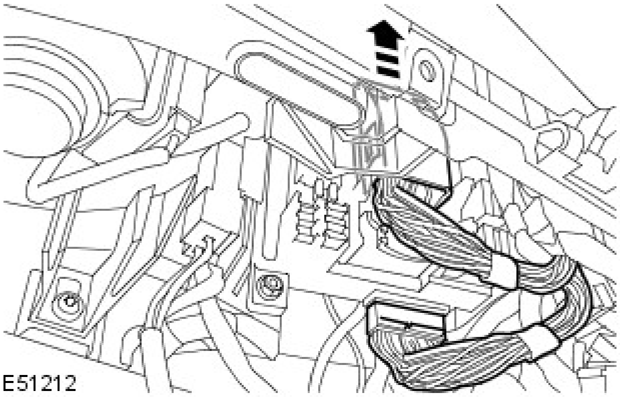
- Remove the 2 nuts.

9. Disconnect the heater motor electrical connector.



E51211

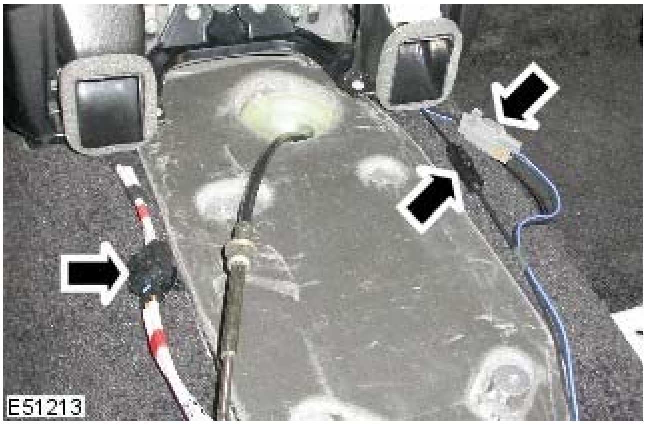
10. Disconnect the 5 electrical connectors from the passenger side lower A-pillar.



E51212

11. Disconnect 2 central junction box (CJB) electrical connectors.

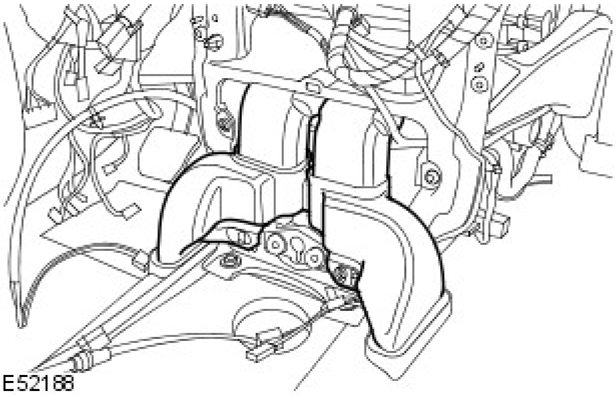
12. Disconnect 2 electrical connectors from the instrument panel center reinforcement.



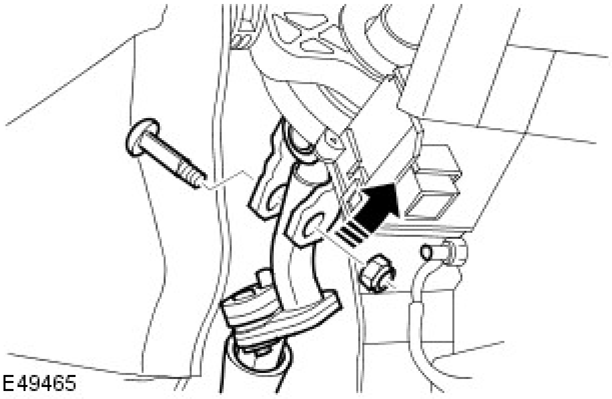
13. ⚠CAUTION: Cover fibre optic cable connectors to minimise dust ingress and avoid bending the cables in a radius of less than 30 mm.

If installed, disconnect the instrument panel center reinforcement fibre optic cables.

- Disconnect the electrical connector.

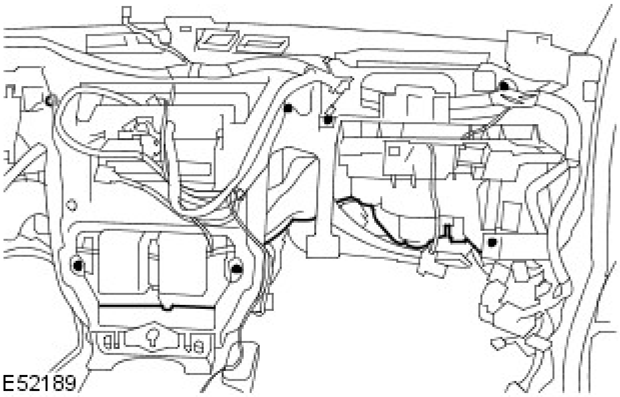


14. Remove the heater housing center ducts.



15. Disconnect the steering column intermediate shaft from the steering column.

- Note the fitted position.
- Remove the special bolt and discard the nut.

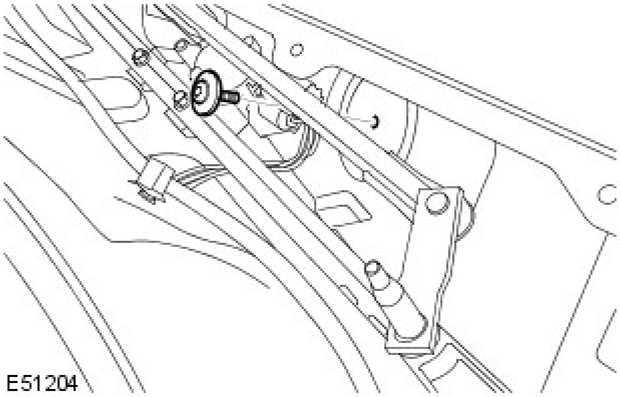


16. Release the heater housing from the instrument panel carrier.

- Remove the 7 Torx screws.

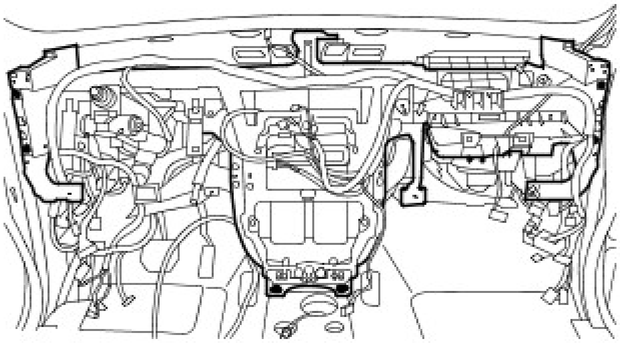
17. Remove the plenum chamber panel.
For additional information, refer to: Plenum Chamber (412-01 Air Distribution and Filtering, Removal and Installation).

18. Remove the instrument panel carrier to bulkhead Torx bolt.



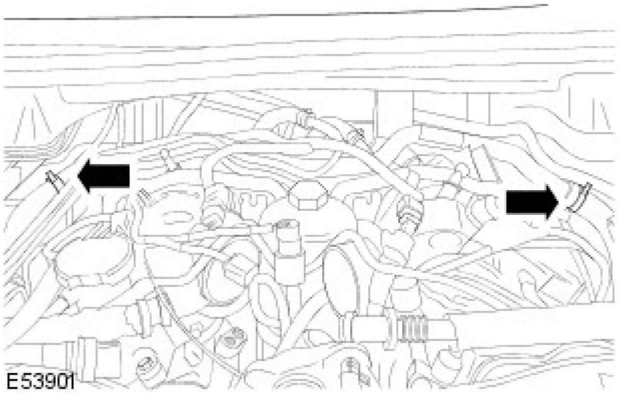
19. With assistance, remove the instrument panel.

- Remove the 6 Torx bolts.



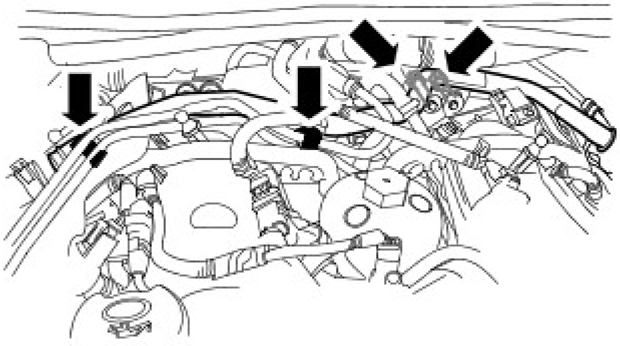
20. Disconnect both exhaust gas recirculation (EGR) coolant cross-over pipe hoses.

- Release the 2 clips.



21. Remove the EGR coolant cross-over pipe.

- Remove the 2 bolts.
- Release the 2 clips.

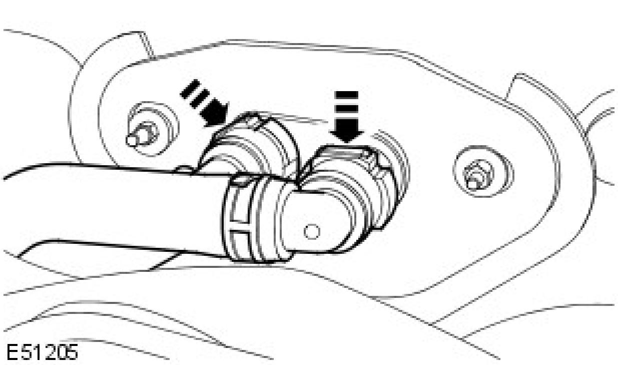


E55561

22. CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect 2 heater hoses from the bulkhead.

- Release the 2 clips.



E51205

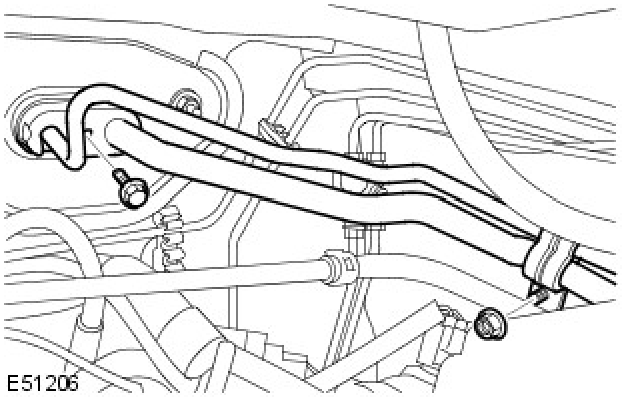
23. Release 2 A/C lines from the body.

- Remove the nut.

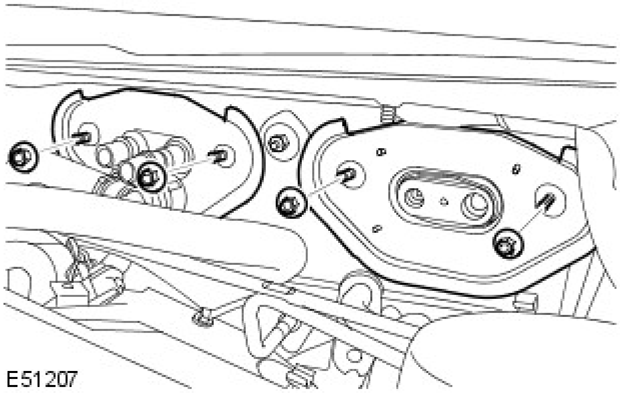
24. CAUTION: Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Release 2 A/C lines from the bulkhead.

- Remove the bolt.
- Remove and discard the O-ring seals.

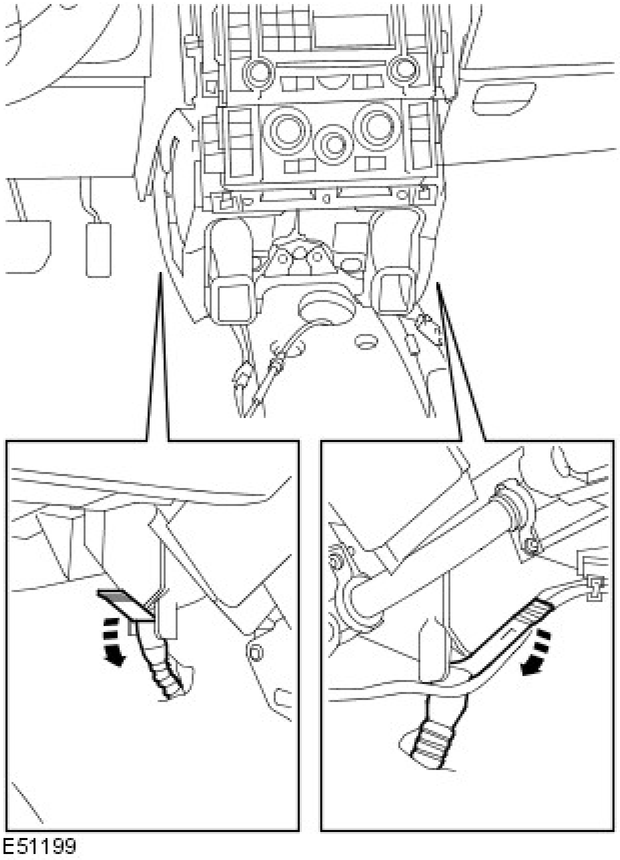


E51206

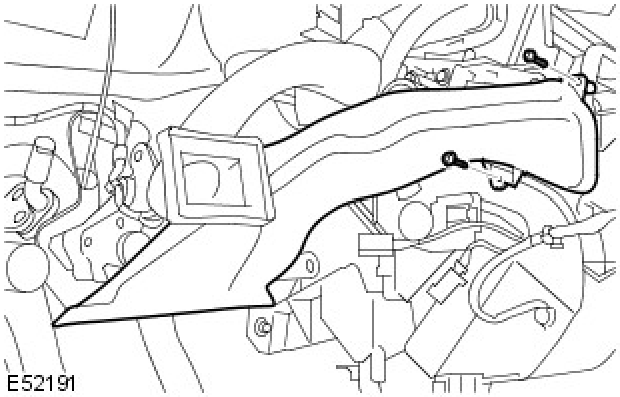


25. Remove the 2 adapter panels.

- Remove the 4 nuts.

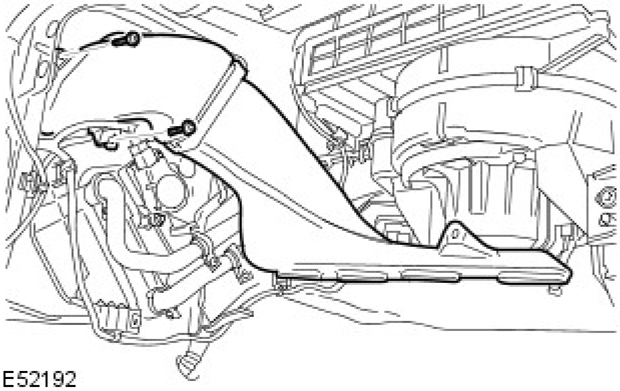


26. Disconnect 2 drain tubes from the heater housing.



27. Remove the driver side footwell duct.

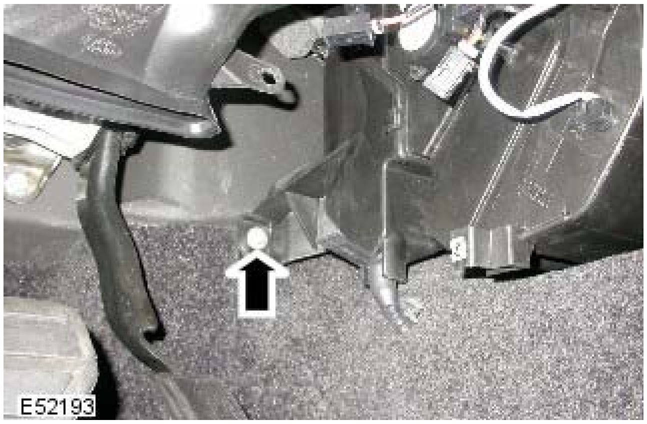
- Remove the 2 Torx screws.



E52192

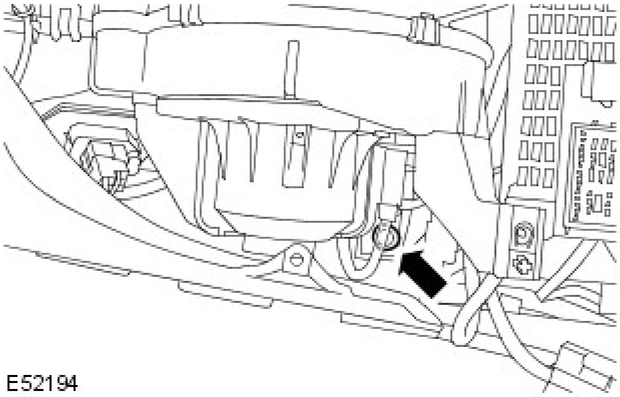
28. Remove the passenger side footwell duct.

- Remove the 2 Torx screws.



E52193

29. Driver side: Remove the heater housing to bulkhead Torx bolt.



E52194

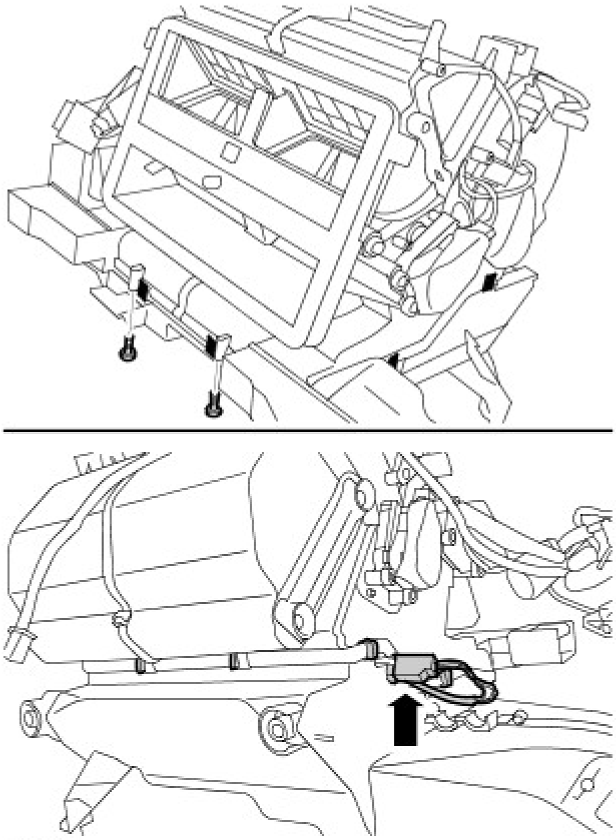
30. Passenger side: Remove the heater housing to bulkhead Torx bolt.

31. Remove the heater housing.

32. Disconnect the evaporator core temperature sensor electrical connector.

33. Release the heater core housing.

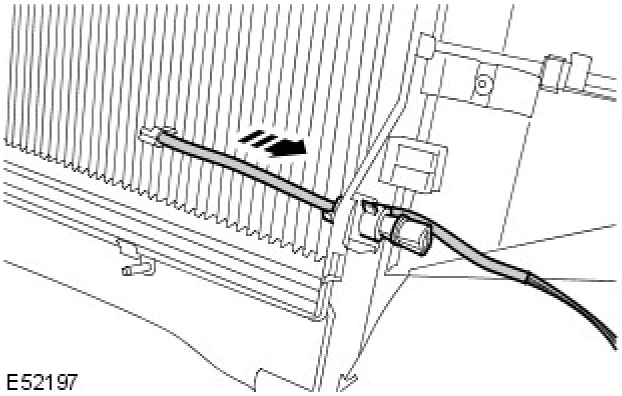
- Remove the 2 screws.
- Remove the 8 clips.



E52196

34. Remove the evaporator core.

- Release the temperature sensor.



E52197

Installation

1. Install the evaporator core.
    - Secure the temperature sensor.
2. Secure the heater core housing.
    - Install the clips.
    - Tighten the screws.
3. Connect the temperature sensor electrical connector.
4. Install the heater housing.
5. Passenger side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).

6. Driver side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).

7. Install the footwell ducts.

- Tighten the Torx screws.

8. Connect the drain tubes to the heater housing.

9. Install the adapter panels.

- Tighten the nuts to 6 Nm (4 lb.ft).

10. Secure the A/C lines to the bulkhead.

- Clean the components.
- Install new O-ring seals.
- Tighten the bolt to 6 Nm (4 lb.ft).

11. Secure the A/C lines to the body.

- Tighten the nut to 6 Nm (4 lb.ft).

12. Connect the bulkhead heater hoses.

13. Install the EGR coolant cross-over pipe.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Secure the clips.
- Connect the hoses and secure with the clips.

14. With assistance, install the instrument panel.

- Tighten the Torx bolts to 25 Nm (18 lb.ft).

15. Install the instrument panel carrier to bulkhead Torx bolt and tighten to 25 Nm (18 lb.ft).

16. Install the plenum chamber panel.
For additional information, refer to: Plenum Chamber (412-01 Air Distribution and Filtering, Removal and Installation).

17. Secure the heater housing.

- Tighten the screws.

18. Connect the steering column intermediate shaft.

- Install the special bolt and tighten the new nut to 22 Nm (16 lb.ft).

19. Install the heater housing center ducts.

20. Connect the instrument panel center reinforcement fibre optic cables.

21. Connect the instrument panel center reinforcement electrical connectors.

22. Connect the CJB electrical connectors.

23. Connect the heater motor electrical connector.

24. Connect the electrical connectors to the passenger side lower A-pillar.

25. Connect the ground cables to the passenger side lower A-pillar.

- Tighten the nuts to 10 Nm (7 lb.ft).

26. Connect the electrical connectors to the driver side lower

A-pillar.

27. Connect the ground cables to the driver side lower A-pillar.

- Tighten the nuts to 10 Nm (7 lb.ft).

28. Install the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).

29. Install the front seat.
For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).

30. Recharge the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

31. Refill the cooling system.
For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03C Engine Cooling - TDV6 2.7L Diesel, General Procedures).

Published: 11-May-2011

Air Conditioning - TDV6 2.7L Diesel - Condenser Core

Removal and Installation

Removal

• NOTE: The receiver drier need only be changed under the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure). The system is leaking and refrigerant has been lost to atmosphere. Refrigerant circuit has been open more than 24 hours due to repair.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

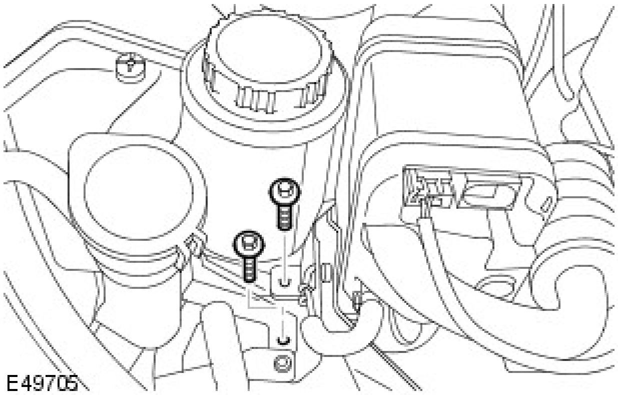
Raise and support the vehicle.

2. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

3. Recover the A/C refrigerant.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

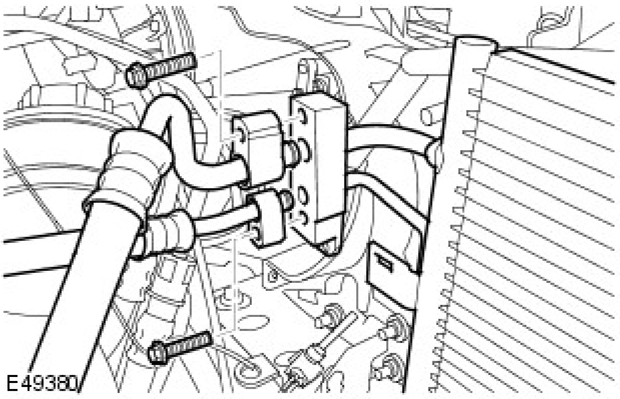
4. Remove the cooling fan lower shroud.
For additional information, refer to: Cooling Fan Shroud (303-03C Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).

5. Remove the radiator grille.
For additional information, refer to: Radiator Grille (501-08 Exterior Trim and Ornamentation, Removal and Installation).



6. Release the coolant expansion tank.

- Remove the 2 bolts.



7. ⚠ CAUTION: Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

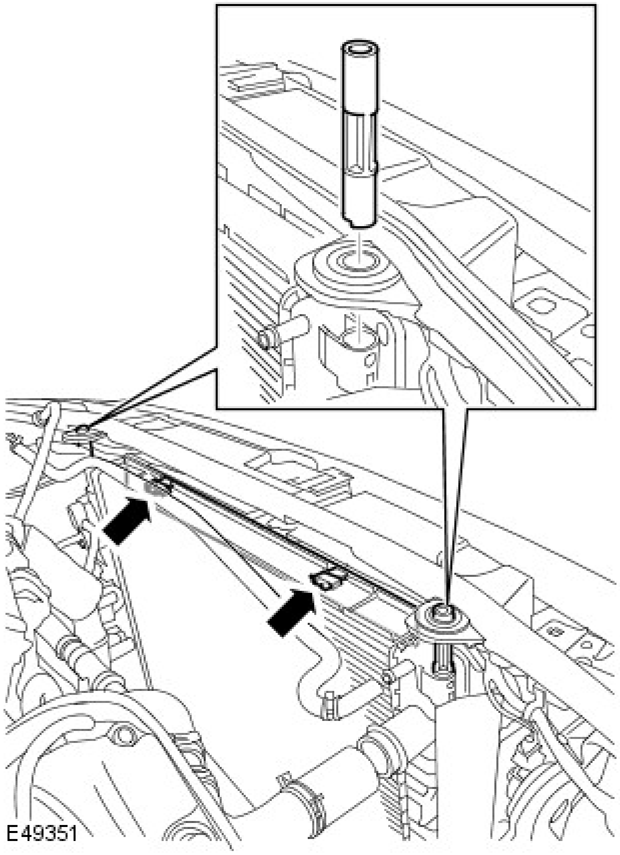
Disconnect the A/C condenser refrigerant lines.

- Remove the 2 bolts.
- Discard the O-ring seals.

8. Remove the radiator securing pegs.

9. Remove the radiator upper deflector.

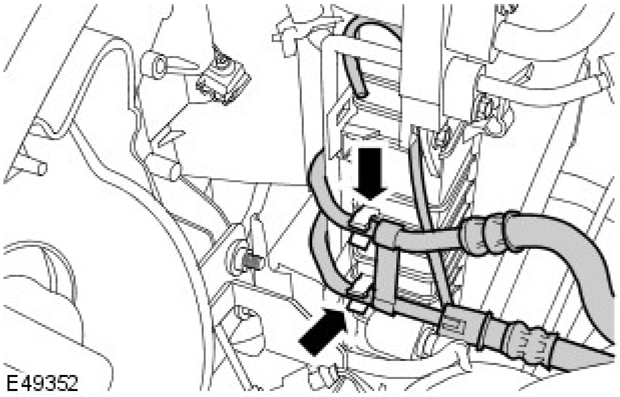
- Release the 2 clips.



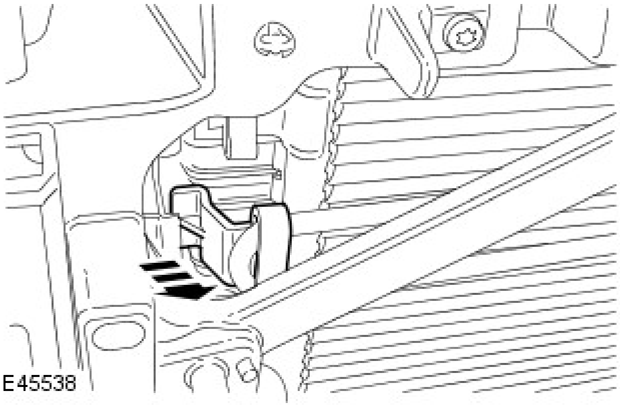
10. Release the power steering fluid cooler.

- Release it from 3 clips.

11. Release the front differential breather line.



12. Remove the power steering fluid cooler line clip.

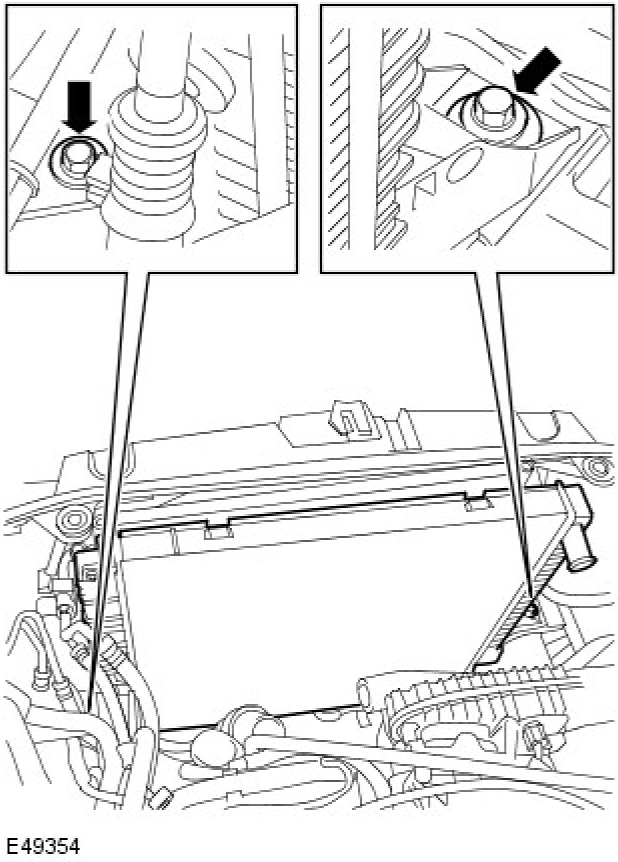


13. Tie the engine air intake duct towards the engine.

14. Tie the fuel fired booster heater coolant lines towards the engine.

15. Move the radiator towards the engine.

- Remove the 2 bolts.
- Lift it clear of its mountings.
- Tie the radiator towards the engine.



16. Remove the A/C condenser.

- Remove the bolt.
- Release it from the 4 clips

Installation

1. Install the A/C condenser.

2. Position the radiator.

- Lift the radiator onto its mountings.

- Tighten the bolts to 25 Nm (18 lb.ft).

3. Position the front differential breather line.

4. Install the power steering fluid cooler line clip.

5. Secure the power steering fluid cooler line.

- Secure in the 3 clips.

6. Install the radiator upper deflector.

7. Install the radiator securing pegs.

8. Secure the coolant expansion tank.

- Tighten the 2 bolts to 10 Nm (7 lb.ft).

9. Connect the A/C condenser refrigerant lines.

- Clean the component mating faces.
- Install new O-ring seals.
- Tighten the bolts to 25 Nm (18 lb.ft).

10. Install the radiator grille.
For additional information, refer to: Radiator Grille (501-08 Exterior Trim and Ornamentation, Removal and Installation).

11. Install the cooling fan lower shroud.
For additional information, refer to: Cooling Fan Shroud (303-03C Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).

12. Fill the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

Removal and Installation

Removal

• NOTE: The receiver drier need only be changed under the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure). The system is leaking and refrigerant has been lost to atmosphere. Refrigerant circuit has been open more than 24 hours due to repair.

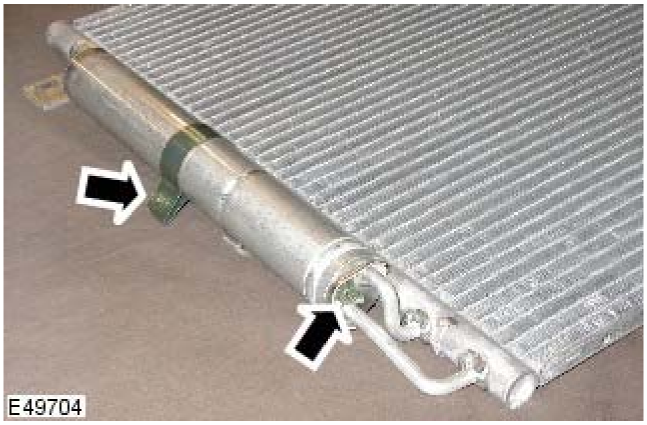
1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the A/C condenser.
For additional information, refer to: Condenser Core (412-03C Air Conditioning - TDV6 2.7L Diesel, Removal and Installation).

3. Remove the receiver drier support bracket clamp.

- Loosen the screw.



E49704

4. ⚠ CAUTION: Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Remove the receiver drier.

- Remove the bolt.
- Remove the clamp.
- Remove and discard the 2 O-ring seals.

Installation

1. Install the receiver drier.

- Clean the component mating faces.
- Install new O-ring seals.
- Install the clamp.
- Tighten the bolt to 10 Nm (7 lb.ft).

2. Install the receiver drier support bracket clamp.

- Tighten the screw.

3. Install the A/C condenser.
For additional information, refer to: Condenser Core (412-03C Air Conditioning - TDV6 2.7L Diesel, Removal and Installation).

Published: 11-May-2011

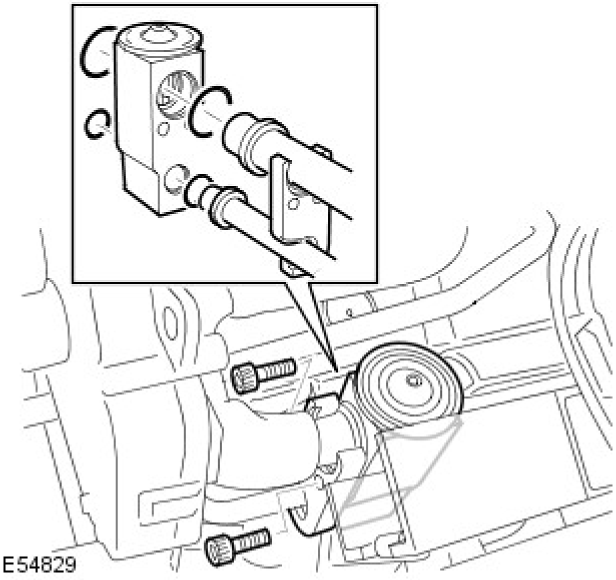
Air Conditioning - TDV6 2.7L Diesel - Thermostatic Expansion Valve

Removal and Installation

Removal

1. Evacuate the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

2. Remove the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).



3. ⚠ CAUTION: Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Remove the thermostatic expansion valve.

- Remove the cover.
- Remove the 2 Allen bolts.
- Remove and discard the 4 O-ring seals.

Installation

1. Install the thermostatic expansion valve.

- Clean the components.
- Install the new O-ring seals.
- Tighten the Allen bolts to 5 Nm (4 lb.ft).
- Install the cover.

2. Install the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).

3. Recharge the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

Air Conditioning - TDV6 2.7L Diesel - Air Conditioning (A/C) Compressor Pulley

Removal and Installation

Removal

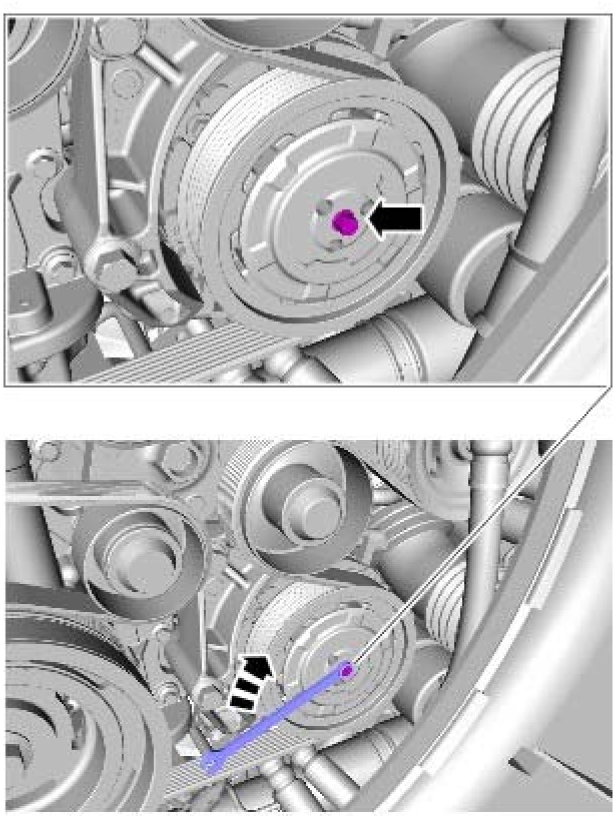
- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.
- NOTE: Components removed for clarity.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the cooling fan.
For additional information, refer to: Cooling Fan (303-03C Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).

3. Using a suitable tool, release the hub locking stud.

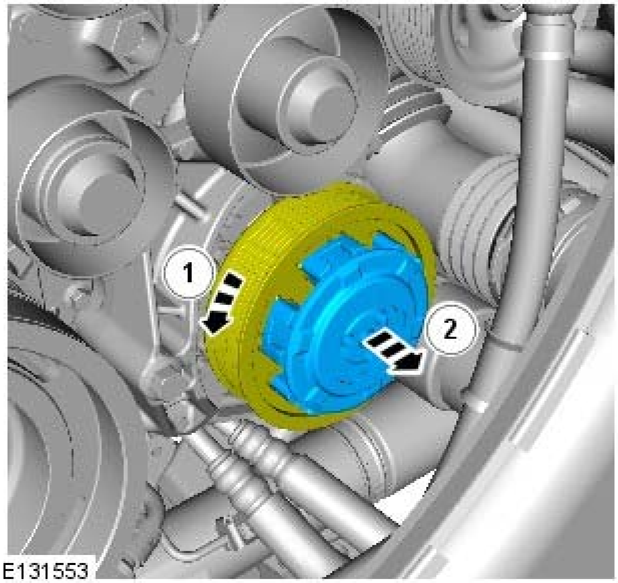
- Rotate the fixing clockwise to release the hub.
- If required, use a suitable tool to prevent the hub from rotating.



E131552

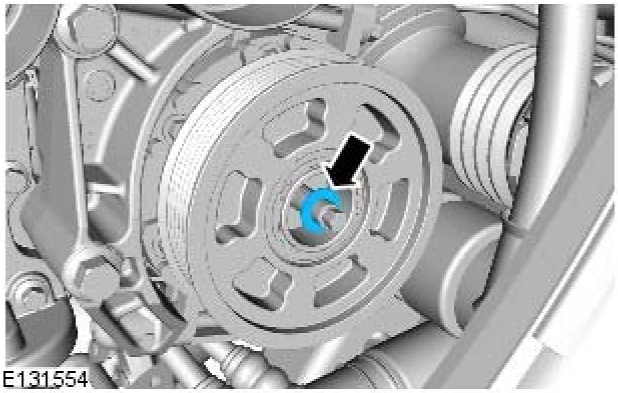
4. NOTE: Using a 3/8 square drive wrench, rotate the tensioner counter clockwise.

Release the accessory drive belt from the A/C compressor pulley.

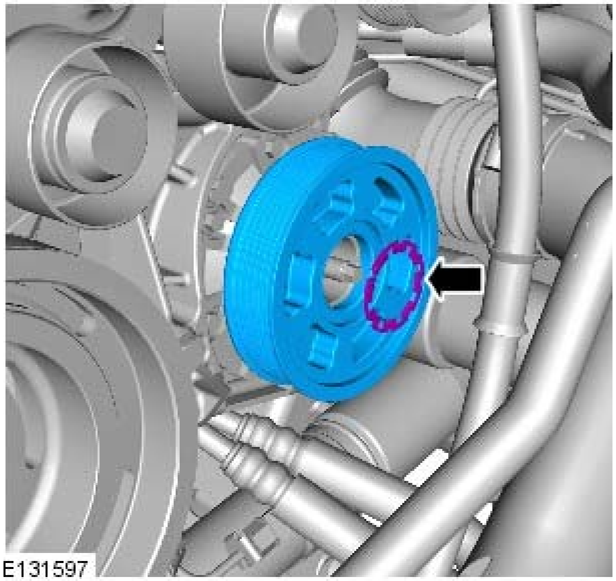


5. Remove and discard the hub assembly.

- Rotate the pulley counter-clockwise, until the hub is released from the pulley.
- Discard the rubber dampers.



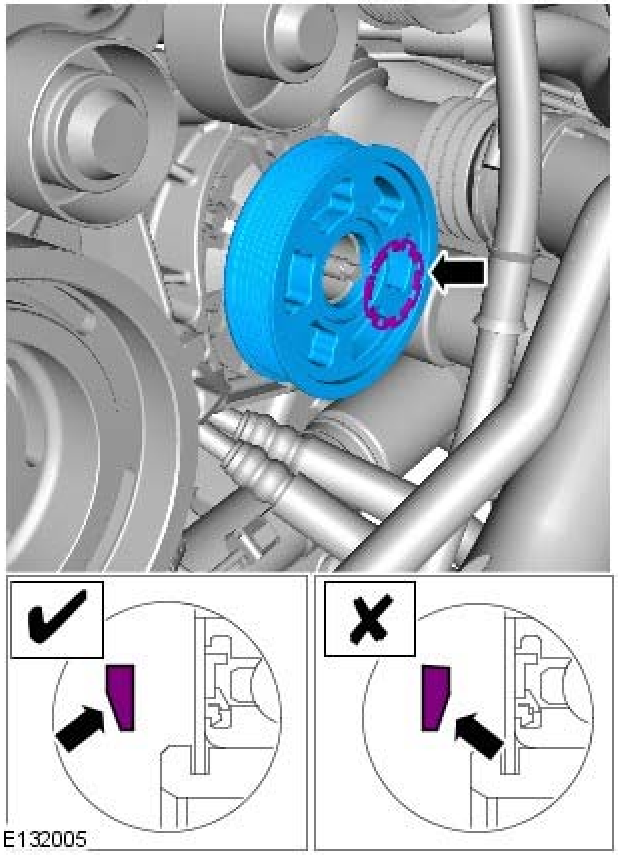
6. Remove and discard the spacer.



7. Remove and discard the drive pulley.

- Remove and discard the circlip.
- Clean the compressor mating surface.

Installation



1. ⚠CAUTION: Make sure the circlip is fitted in the correct orientation.

Install the drive pulley.

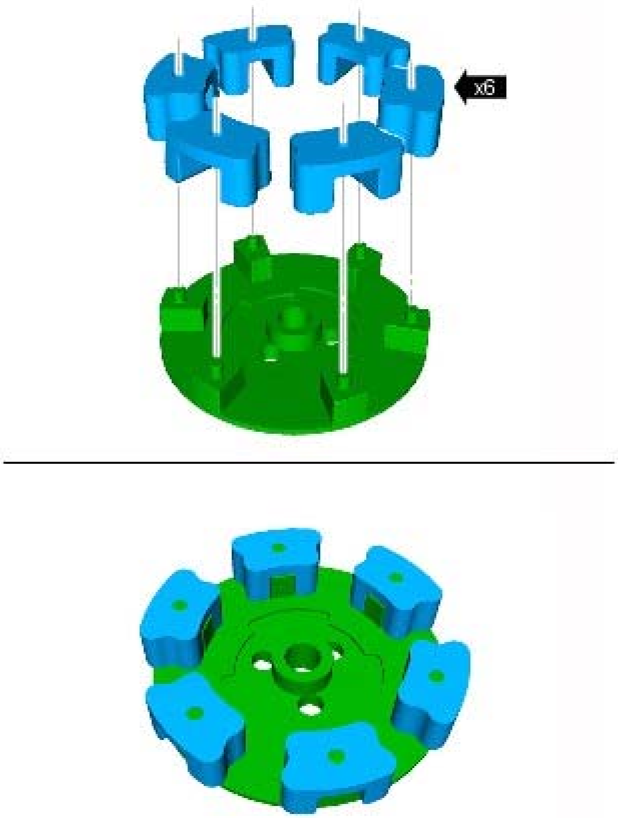
- Install the circlip.

2. Install the spacer.

- Make sure the spacer is fully seated.

3. Install the 6 rubber dampers to the hub assembly.

- Make sure the dampers are installed in the correct orientation.



E131556

4. NOTE: Apply a suitable water based lubricant to the rubber dampers and to the mating surfaces on pulley.

Install the hub assembly.

- Push the hub assembly onto the pulley, and rotate clockwise to screw it onto the compressor shaft.

5. NOTE: Tighten counterclockwise.

Using a suitable tool, tighten the hub locking stud.

- Prevent the pulley rotating by hand.
- Tighten to 3.5 Nm (2.6 lb.ft)

6. Install the auxiliary drive belt.

7. Install the cooling fan.
For additional information, refer to: Cooling Fan (303-03C Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).

8. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Air Conditioning - TDV8 3.6L Diesel - Air Conditioning (A/C) Compressor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Recover the air conditioning (A/C) refrigerant.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

3. Remove the cooling fan belt.
For additional information, refer to: Cooling Fan Belt (303-05D Accessory Drive - TDV8 3.6L Diesel, Removal and Installation).

4. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

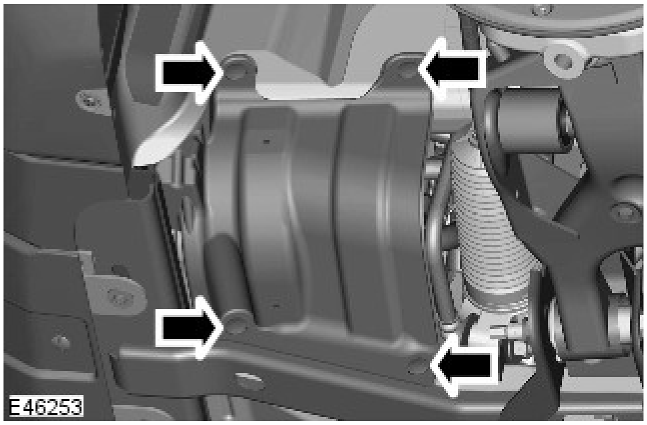
Raise and support the vehicle.

5. Remove the LH front wheel and tire.

6. Remove the front LH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

7. Remove the front LH splash shield.

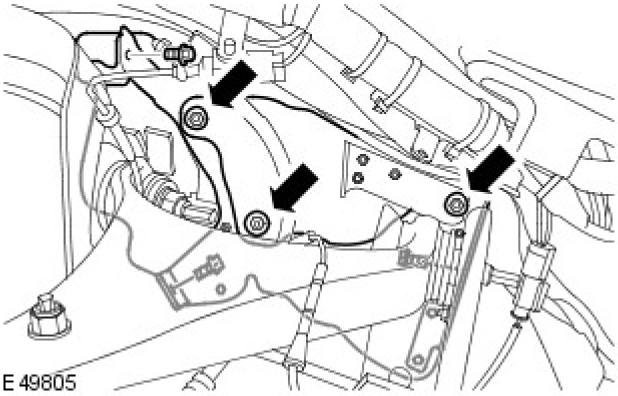
- Remove the 4 clips.

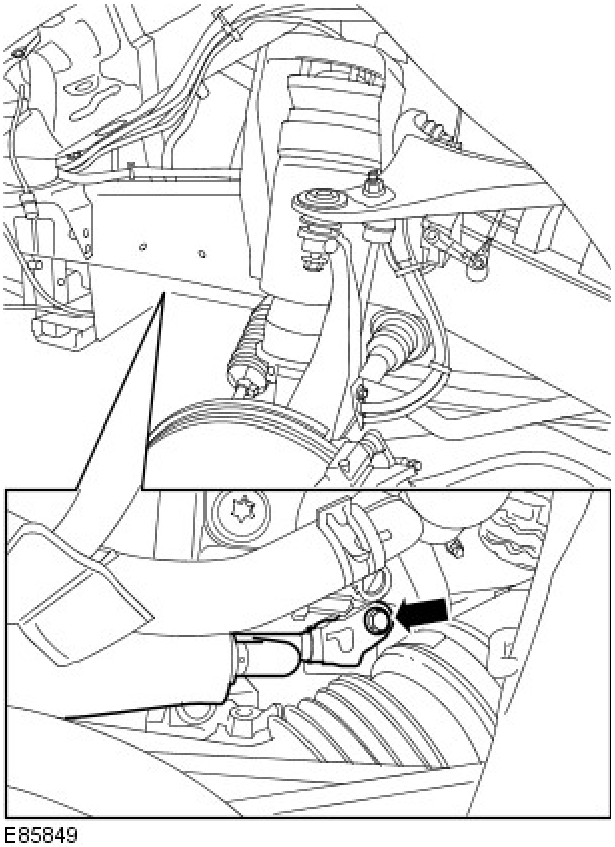


8. NOTE: The heat shield consists of 3 parts.

Remove the LH upper suspension arm and brake line heat shields.

- Remove the 3 nuts.
- Remove the 3 bolts.

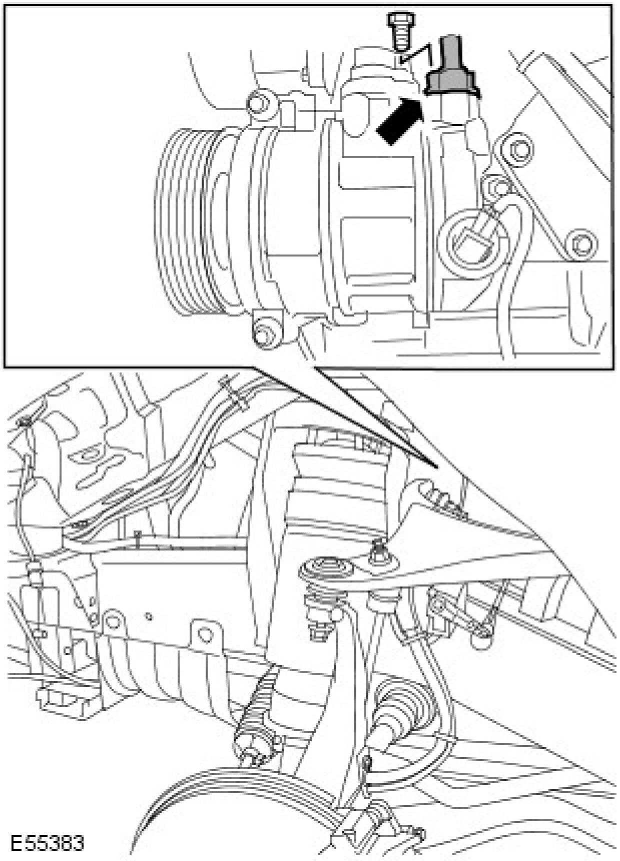




9. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Disconnect the A/C compressor high-pressure refrigerant line.

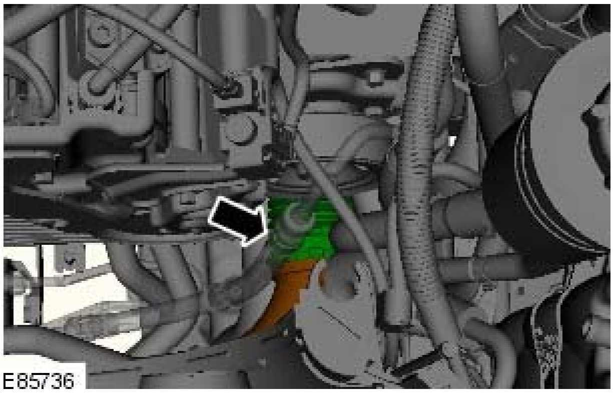
- Remove the bolt.
- Remove and discard the O-ring seal.



10. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Disconnect the A/C compressor low-pressure refrigerant line.

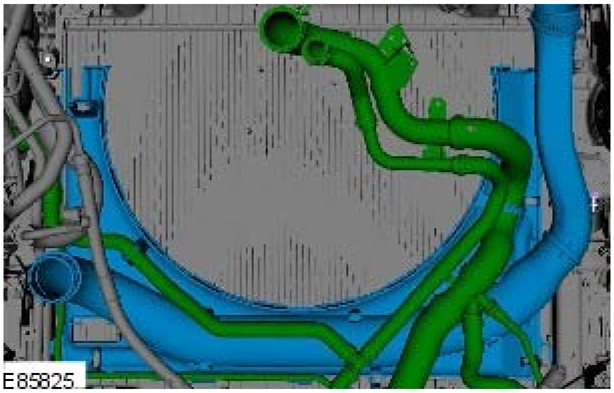
- Remove the bolt.
- Remove and discard the O-ring seal.



E85736

11. Release the LH turbocharger intake tube.

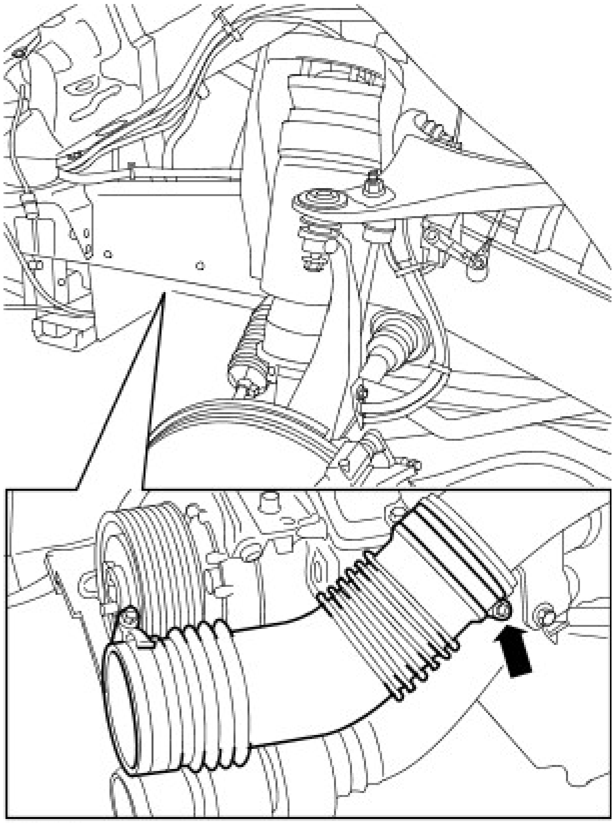
- Loosen the clip.



E85825

12. Remove the cooling fan lower shroud.

- Release the coolant pipes and hoses from the cooling fan lower shroud.
- Release the turbocharger intake tube.



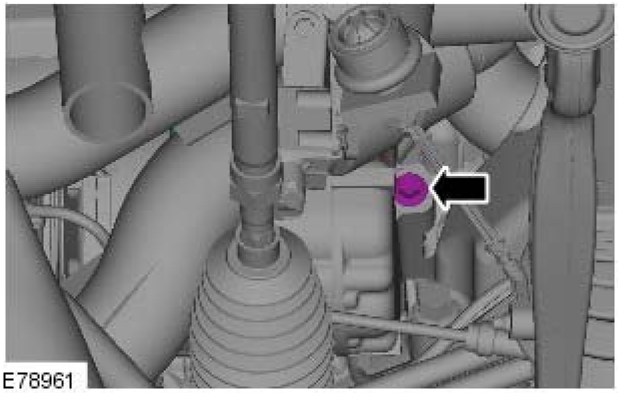
E85850

13. Remove the turbo intake connecting tube.

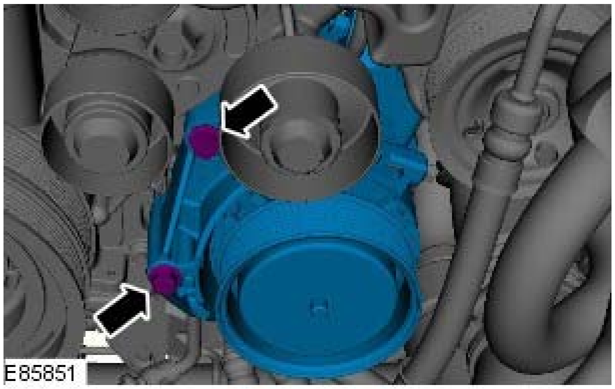
- Release the clip.

14. Disconnect the A/C compressor electrical connector.

- Release the A/C compressor electrical connector from the bracket.



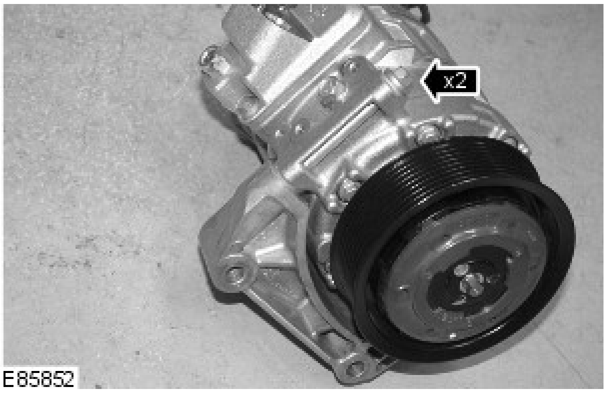
15. Remove the A/C compressor rear bolt.



16. ⚠ CAUTION: Protect the radiator during this operation.

Remove the A/C compressor and support bracket.

- Remove the 2 bolts.



17. NOTE: Do not disassemble further if the component is removed for access only.

Remove the A/C compressor support bracket.

- Remove the 2 bolts.

Installation

1. Install the A/C compressor support bracket.

- Tighten the bolts to 23 Nm (17 lb.ft).

2. ⚠ CAUTION: Protect the radiator during this operation.

Install the A/C compressor and support bracket.

- Tighten the bolts to 48 Nm (35 lb.ft).

3. Install the A/C compressor rear bolt.

- Tighten the bolt to 23 Nm (17 lb.ft).

4. Connect the A/C compressor electrical connector.

- Secure the A/C compressor electrical connector to the bracket.

5. Install the turbo intake connecting tube.

- Secure the clip.

6. Install the cooling fan lower shroud.

- Secure the RH turbocharger intake tube.
- Secure the coolant pipes and hoses to the cooling fan lower shroud.

7. Secure the LH turbocharger inlet tube.

- Tighten the clip.

8. NOTE: Remove and discard the blanking caps.

Connect the A/C compressor low-pressure refrigerant line.

- Install a new O-ring seal.
- Tighten the bolt to 10 Nm (7 lb.ft).

9. NOTE: Remove and discard the blanking caps.

Connect the A/C compressor high-pressure refrigerant line.

- Install a new O-ring seal.
- Tighten the bolt to 10 Nm (7 lb.ft).

10. Install the LH upper suspension arm and brake line heat shields.

- Tighten the nuts.
- Tighten the bolts.

11. Install the front LH splash shield.

- Install the clips.

12. Install the front LH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

13. Install the LH front wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

14. Install the cooling fan belt.
For additional information, refer to: Cooling Fan Belt (303-05D Accessory Drive - TDV8 3.6L Diesel, Removal and Installation).

15. Recharge the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

16. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Air Conditioning - TDV8 3.6L Diesel - Condenser Core

Removal and Installation

Removal

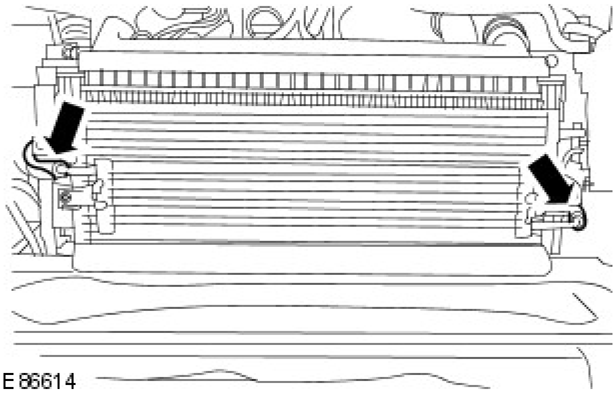
1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Recover the air conditioning (A/C) refrigerant.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

4. Remove the hood latch panel.
For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

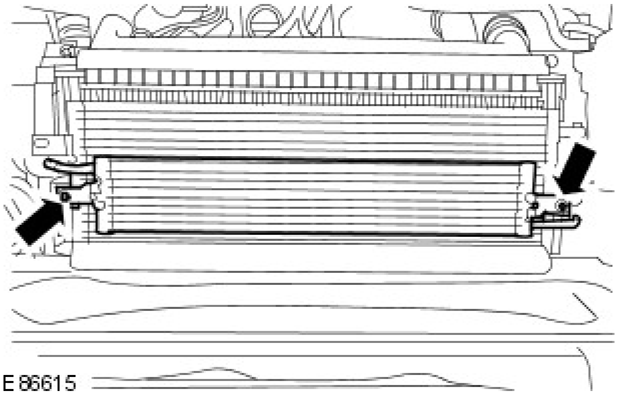


E86614

5. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Disconnect the 2 coolant pipes from the auxiliary radiator.

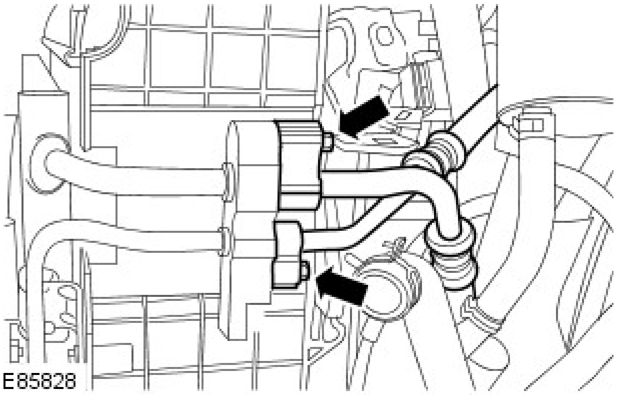
- Release the 2 quick release connectors.



E86615

6. Remove the auxiliary radiator.

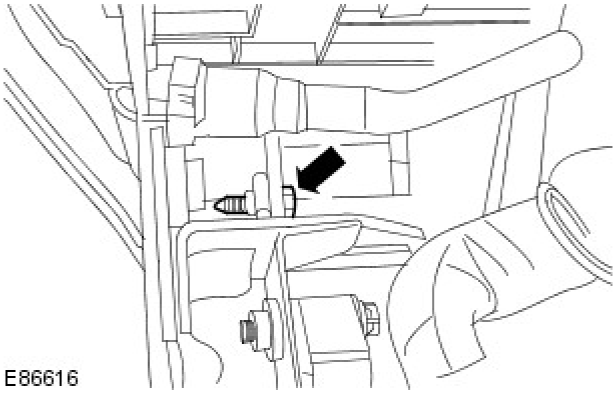
- Remove the 2 bolts.



7. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Disconnect the 2 A/C refrigerant lines.

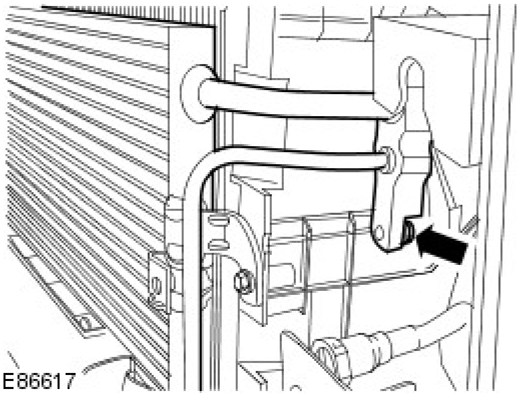
- Remove the 2 bolts.
- Remove and discard the 2 O-ring seals.



8. NOTE: LH illustration shown, RH is similar.

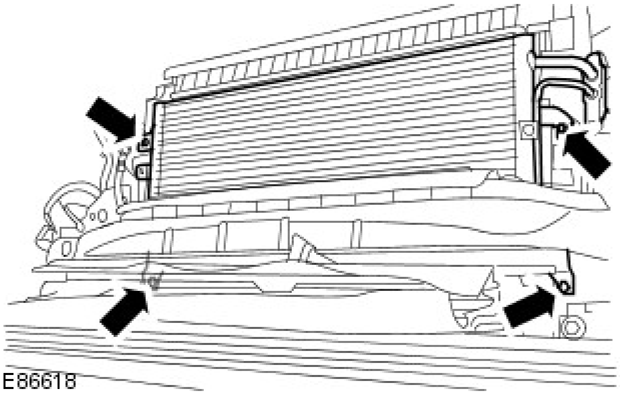
Release the air duct from the cooling module.

- Remove the 2 screws.



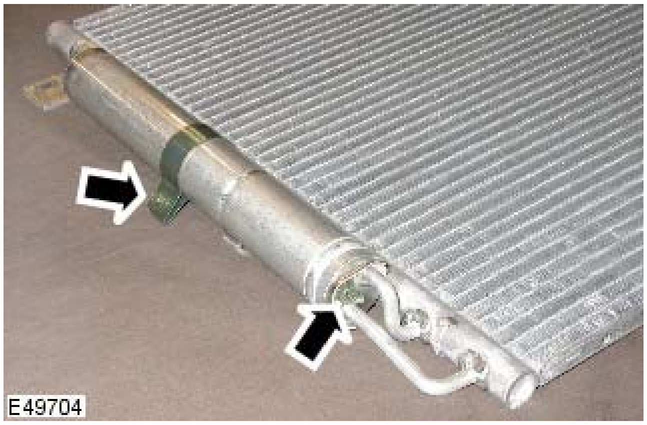
9. Release the A/C refrigerant lines bracket.

- Remove the bolt.



10. Remove the condenser core.

- Remove the 4 bolts.



11. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

• NOTE: Do not disassemble further if the component is removed for access only.

Remove the receiver drier.

- Remove the receiver drier support bracket clamp.
- Remove the bolt.
- Remove the clamp.
- Remove and discard the 2 O-ring seals.

Installation

1. NOTE: Lubricate the O-ring seals with clean refrigerant oil.

• NOTE: Remove and discard the blanking caps.

Install the receiver drier.

- Install new O-ring seals.
- Install the clamps.
- Tighten the bolt to 10 Nm (7 lb.ft).

2. Install the condenser core.

- Tighten the bolts to 8 Nm (6 lb.ft).

3. Secure the A/C refrigerant lines bracket.

- Tighten the bolt to 8 Nm (6 lb.ft)

4. Secure the air duct to the cooling module.

- Tighten the screws.

5. NOTE: Remove and discard the blanking caps.

• NOTE: Lubricate the O-ring seals with clean refrigerant oil.

Connect the A/C condenser refrigerant lines.

- Install new O-ring seals.
- Tighten the bolts to 10 Nm (7 lb.ft).

6. Install the auxiliary radiator.

- Tighten the bolts to 10 Nm (7 lb.ft).

7. NOTE: Remove and discard the blanking caps.

Connect the coolant pipes to the auxiliary radiator.

8. Install the hood latch panel.
For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

9. Recharge the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

10. Connect the battery ground cable.

For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

11. Check and top up the coolant.

Air Conditioning - TDV8 3.6L Diesel - Evaporator Core

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the engine cover.

3. Evacuate the air conditioning (A/C) system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

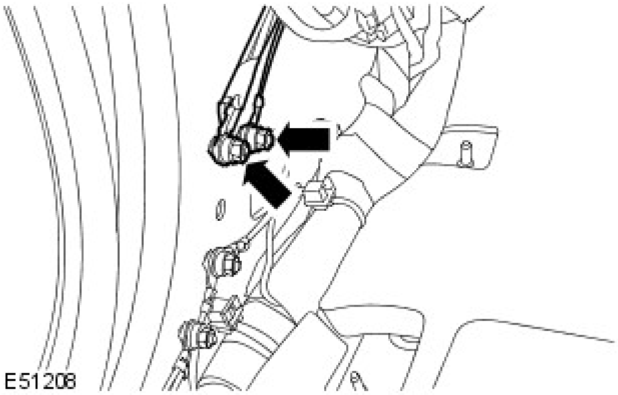
4. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

5. Partially drain the cooling system.
For additional information, refer to: Cooling System Partial Draining, Filling and Bleeding (303-03E Engine Cooling - TDV8 3.6L Diesel, General Procedures).

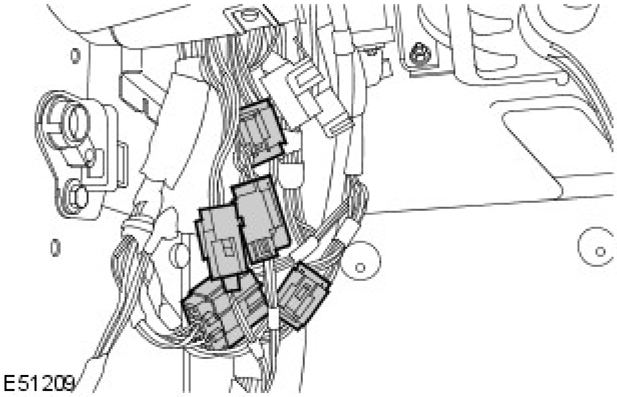
6. Remove the driver side front seat.
For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).

7. Remove the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).

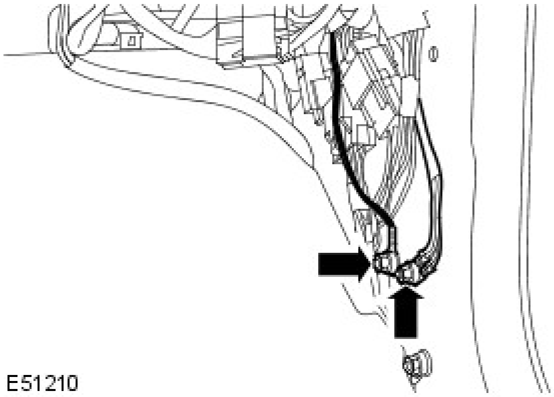


8. Release the 3 ground cables from the driver side lower A-pillar.

- Remove the 2 nuts.



9. Disconnect the 5 electrical connectors from the driver side lower A-pillar.

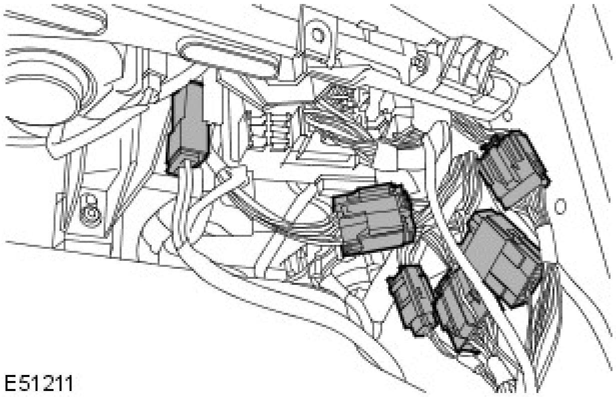


10. Release the 3 ground cables from the passenger side lower A-pillar.

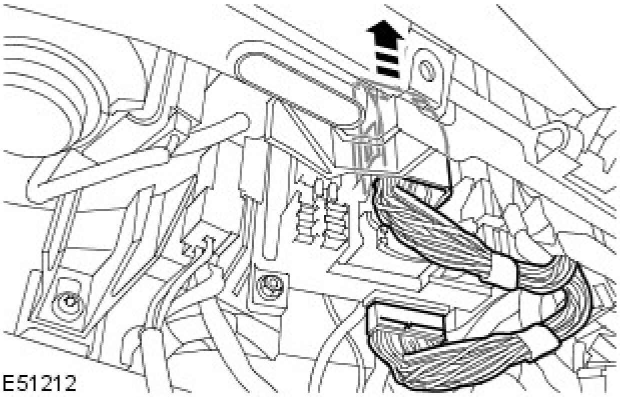
- Remove the 2 nuts.

11. Disconnect the heater motor electrical connector.

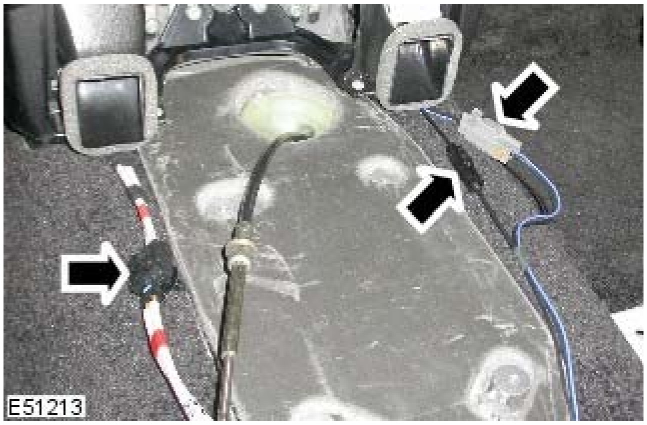
12. Disconnect the 5 electrical connectors from the passenger side lower A-pillar.



13. Disconnect the 2 central junction box (CJB) electrical connectors.



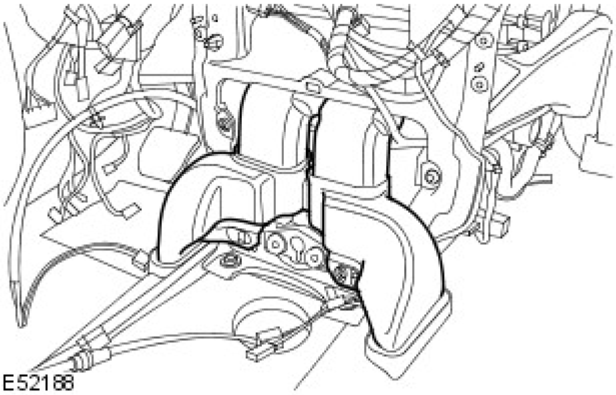
14. Disconnect the 2 electrical connectors from the instrument panel center reinforcement.



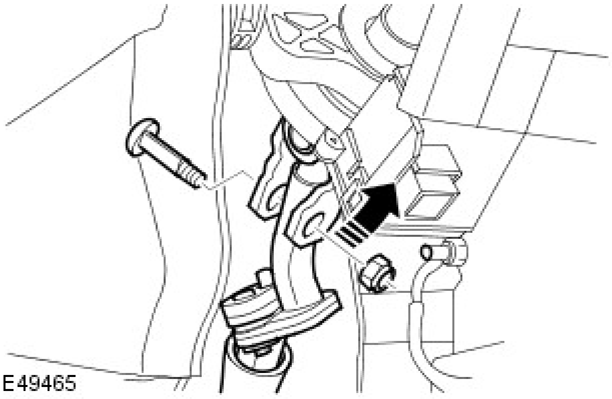
15. ⚠ CAUTION: Cover fiber optic cable connectors to minimize dust ingress and avoid bending the cables in a radius of less than 30 mm.

If installed, disconnect the instrument panel center reinforcement fibre optic cables.

- Disconnect the electrical connector.

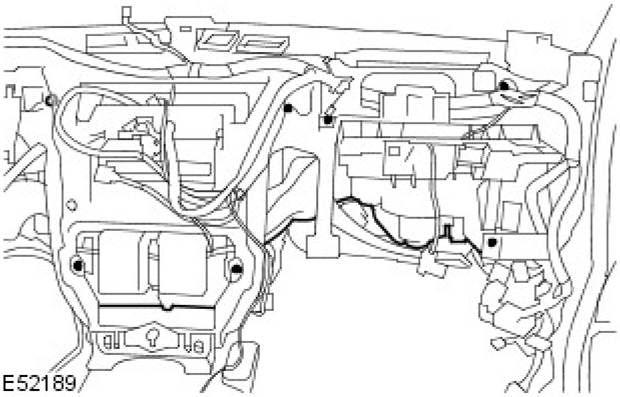


16. Remove the heater housing center ducts.



17. Disconnect the steering column intermediate shaft from the steering column.

- Note the fitted position.
- Remove the special bolt and discard the nut.

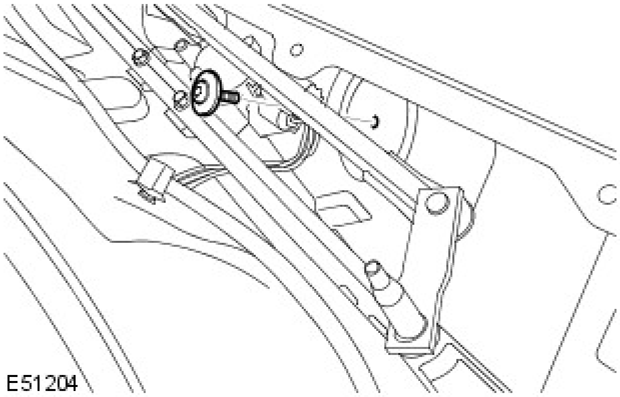


18. Release the heater housing from the instrument panel carrier.

- Remove the 7 screws.

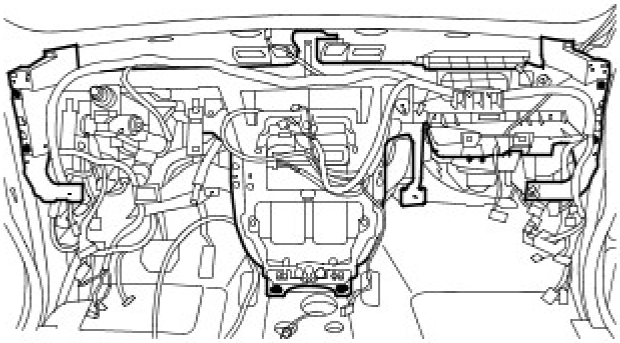
19. Remove the plenum chamber panel.
For additional information, refer to: Plenum Chamber (412-01 Air Distribution and Filtering, Removal and Installation).

20. Remove the instrument panel carrier to bulkhead bolt.



21. With assistance, remove the instrument panel.

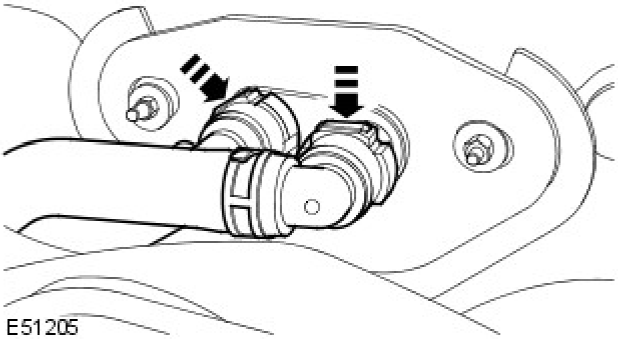
- Remove the 6 bolts.



22. ⚠ CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

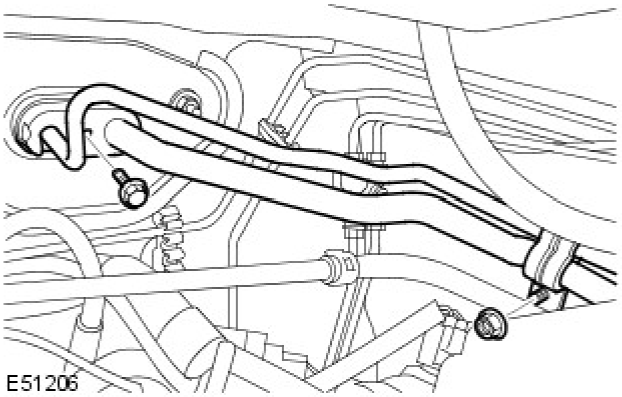
Disconnect 2 heater hoses from the bulkhead.

- Release the 2 clips.



23. Release the 2 A/C lines from the body.

- Remove the nut.

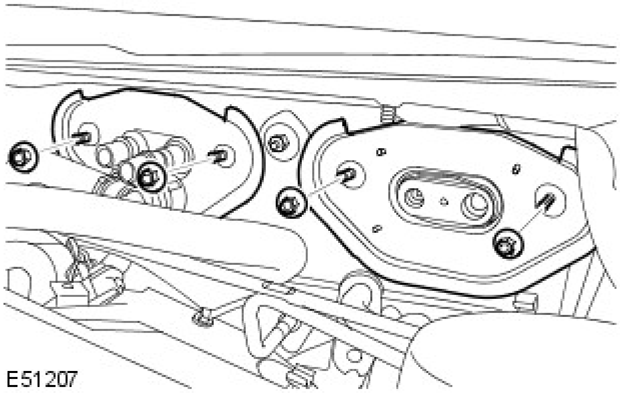


E51206

24. CAUTION: Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Release the 2 A/C lines from the bulkhead.

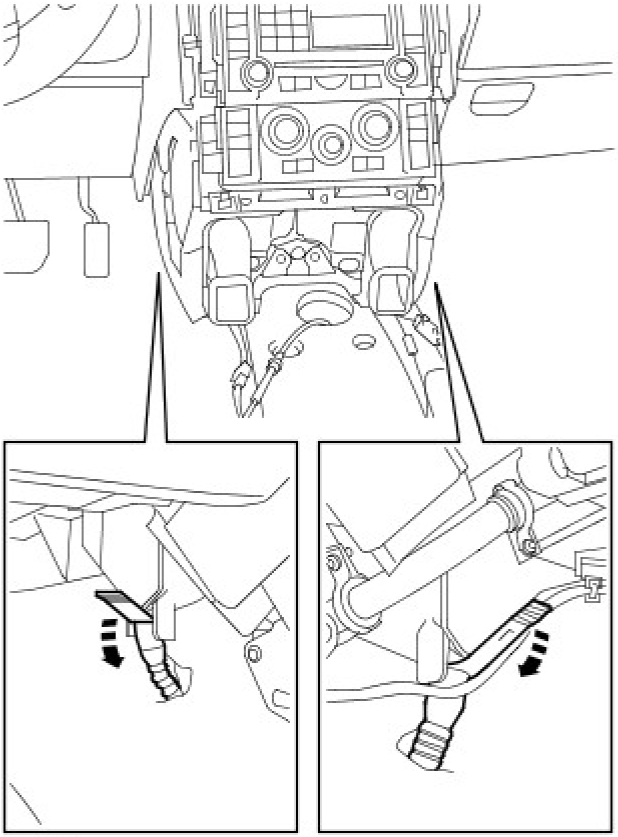
- Remove the bolt.
- Remove and discard the O-ring seals.



E51207

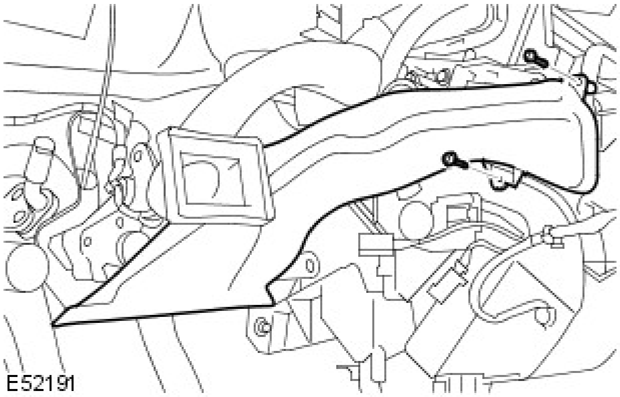
25. Remove the 2 adapter panels.

- Remove the 4 nuts.



E51199

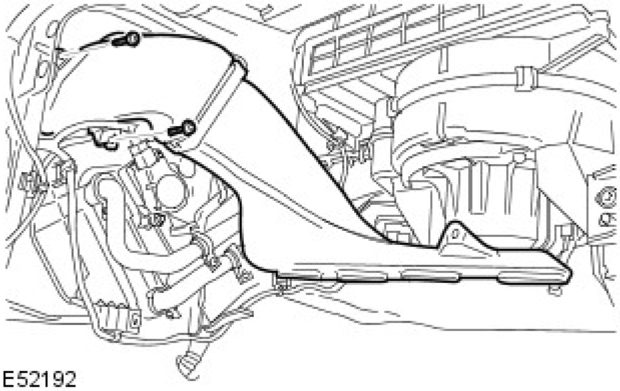
26. Disconnect the 2 drain tubes from the heater housing.



E52191

27. Remove the driver side footwell duct.

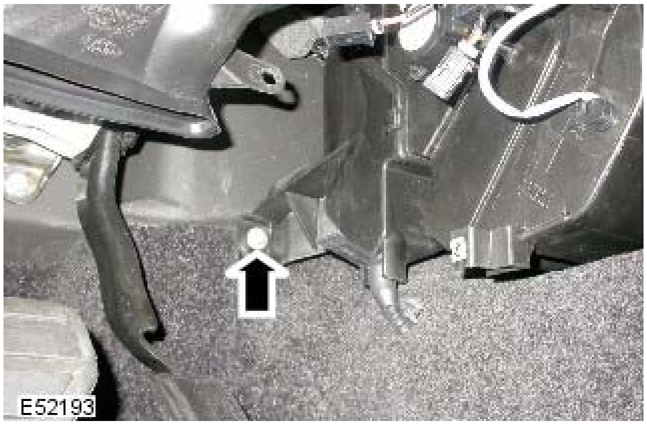
- Remove the 2 Torx screws.



E52192

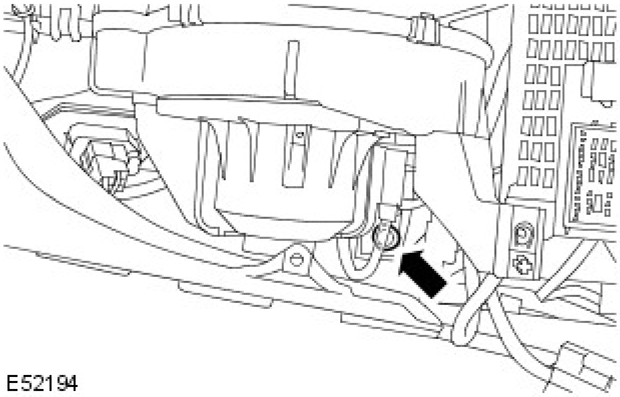
28. Remove the passenger side footwell duct.

- Remove the 2 Torx screws.



E52193

29. Driver side: Remove the heater housing to bulkhead Torx bolt.



E52194

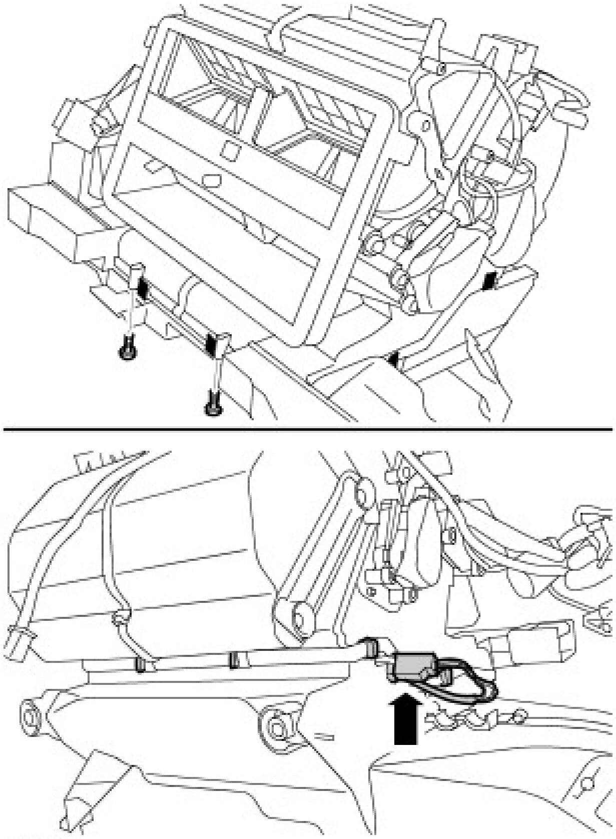
30. Passenger side: Remove the heater housing to bulkhead Torx bolt.

31. Remove the heater housing.

32. Disconnect the evaporator core temperature sensor electrical connector.

33. Release the heater core housing.

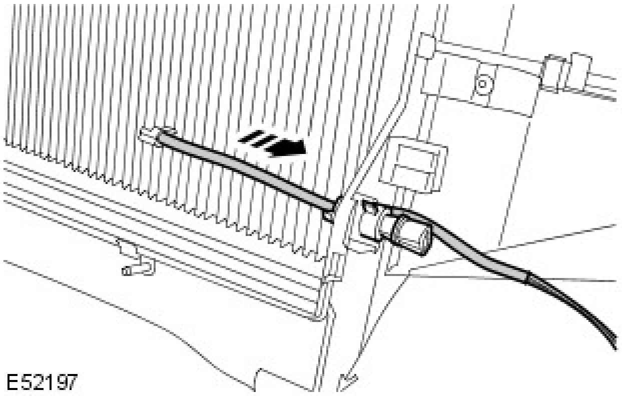
- Remove the 2 screws.
- Remove the 8 clips.



E52196

34. Remove the evaporator core.

- Release the temperature sensor.



E52197

Installation

1. Install the evaporator core.

- Secure the temperature sensor.

2. Secure the heater core housing.

- Install the clips.
- Tighten the screws.

3. Connect the temperature sensor electrical connector.

4. Install the heater housing.

5. Passenger side: Install the heater housing to bulkhead bolt and tighten to 6 Nm (4 lb.ft).

6. Driver side: Install the heater housing to bulkhead bolt and tighten to 6 Nm (4 lb.ft).

7. Install the footwell ducts.

- Tighten the screws.

8. Connect the drain tubes to the heater housing.

9. Install the adapter panels.

- Tighten the nuts to 6 Nm (4 lb.ft).

10. Secure the A/C lines to the bulkhead.

- Clean the components.
- Install new O-ring seals.
- Tighten the bolt to 6 Nm (4 lb.ft).

11. Secure the A/C lines to the body.

- Tighten the nut to 6 Nm (4 lb.ft).

12. Connect the bulkhead heater hoses.

13. With assistance, install the instrument panel.

- Tighten the bolts to 25 Nm (18 lb.ft).

14. Install the instrument panel carrier to bulkhead bolt and tighten to 25 Nm (18 lb.ft).

15. Install the plenum chamber panel.
For additional information, refer to: Plenum Chamber (412-01 Air Distribution and Filtering, Removal and Installation).

16. Secure the heater housing.

- Tighten the screws.

17. Connect the steering column intermediate shaft.

- Install the special bolt and tighten the new nut to 22 Nm (16 lb.ft).

18. Install the heater housing center ducts.

19. Connect the instrument panel center reinforcement fibre optic cables.

20. Connect the instrument panel center reinforcement electrical connectors.

21. Connect the CJB electrical connectors.

22. Connect the heater motor electrical connector.

23. Connect the electrical connectors to the passenger side lower A-pillar.

24. Connect the ground cables to the passenger side lower A-pillar.

- Tighten the nuts to 10 Nm (7 lb.ft).

25. Connect the electrical connectors to the driver side lower A-pillar.

26. Connect the ground cables to the driver side lower A-pillar.

- Tighten the nuts to 10 Nm (7 lb.ft).

27. Install the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper

Section (501-12 Instrument Panel and Console, Removal and Installation).

28. Install the front seat.
For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).

29. Recharge the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

30. Install the engine cover.

31. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

32. Fill and bleed the cooling system.
For additional information, refer to: Cooling System Partial Draining, Filling and Bleeding (303-03E Engine Cooling - TDV8 3.6L Diesel, General Procedures).

Published: 11-May-2011

Air Conditioning - TDV8 3.6L Diesel - Receiver Drier

Removal and Installation

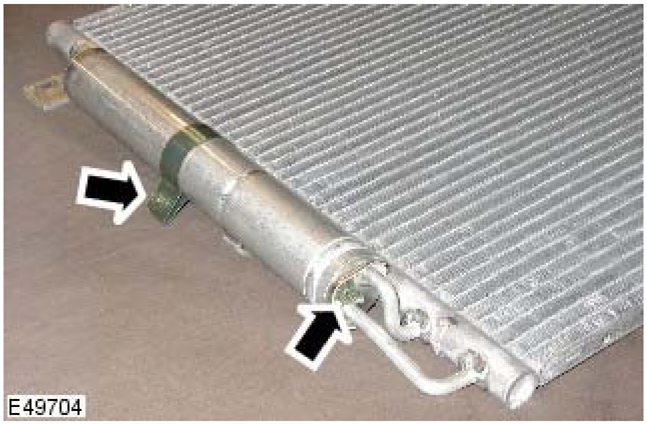
Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the condenser core.
For additional information, refer to: Condenser Core (412-03D Air Conditioning - TDV8 3.6L Diesel, Removal and Installation).



4. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Remove the receiver drier.

- Remove the receiver drier support bracket clamp.
- Remove the bolt.
- Remove the clamp.
- Remove and discard the 2 O-ring seals.

Installation

1. NOTE: Lubricate the O-ring seals with clean refrigerant oil.

• NOTE: Remove and discard the blanking caps.

To install, reverse the removal procedure.

- Tighten the bolt to 10 Nm (7 lb.ft).

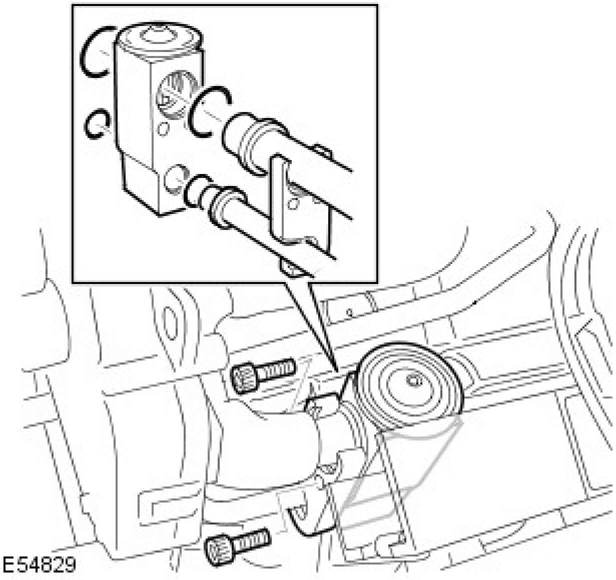
Air Conditioning - TDV8 3.6L Diesel - Thermostatic Expansion Valve

Removal and Installation

Removal

1. Evacuate the A/C system.
   For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).
2. Remove the instrument panel upper section.
   For additional information, refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).



3. ⚠CAUTION: Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Remove the thermostatic expansion valve.

- Remove the cover.
- Remove the 2 Allen bolts.
- Remove and discard the 4 O-ring seals.

Installation

1. Install the thermostatic expansion valve.
   - Clean the components.
   - Install the new O-ring seals.
   - Tighten the Allen bolts to 5 Nm (4 lb.ft).
   - Install the cover.
2. Install the instrument panel upper section.
   For additional information, refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).
3. Recharge the A/C system.
   For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

Air Conditioning - TDV8 3.6L Diesel - Air Conditioning (A/C) Compressor Pulley

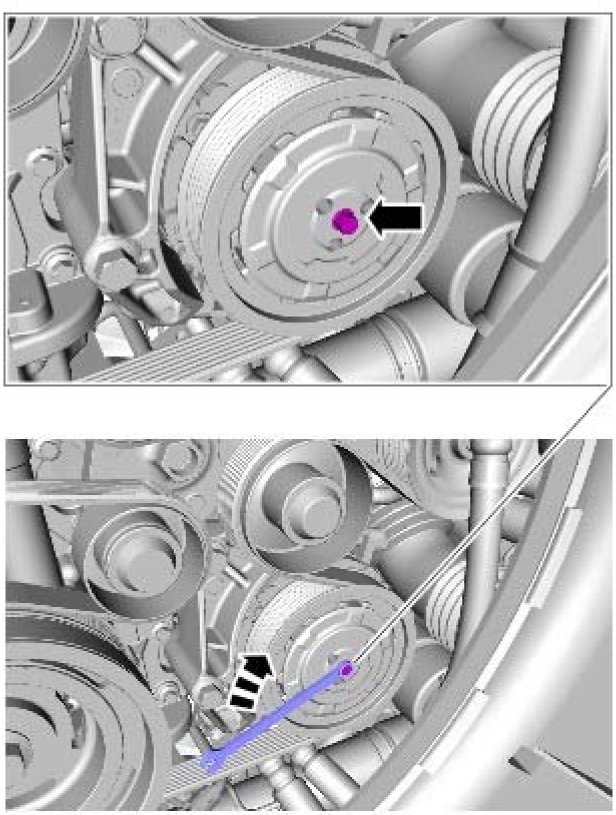
Removal and Installation

Removal

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

- NOTE: Components removed for clarity.

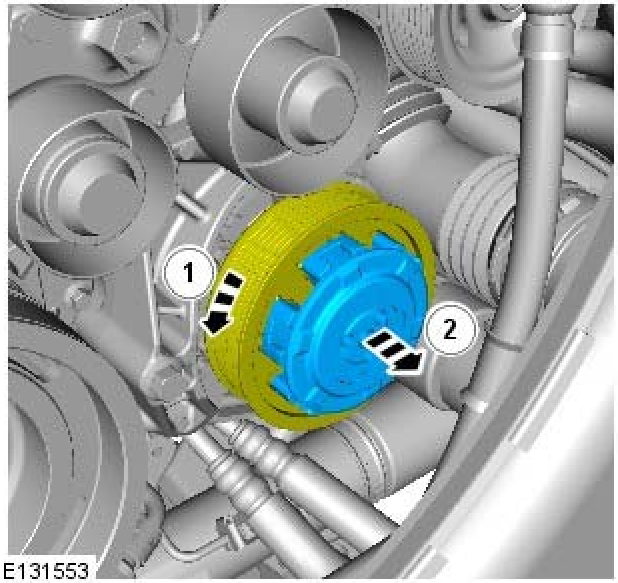
1. Disconnect the battery ground cable. For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the cooling fan. For additional information, refer to: Cooling Fan (303-03E Engine Cooling - TDV8 3.6L Diesel, Removal and Installation).
3. Using a suitable tool, release the hub locking stud.
   - Rotate the fixing clockwise to release the hub.
   - If required, use a suitable tool to prevent the hub from rotating.



E131552

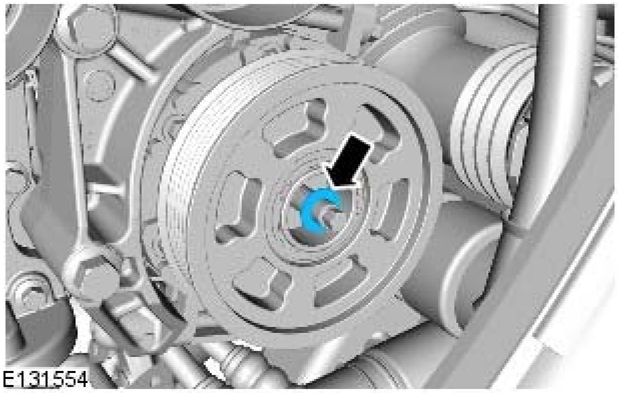
4. NOTE: Using a 3/8 square drive wrench, rotate the tensioner counter clockwise.

Release the accessory drive belt from the A/C compressor pulley.

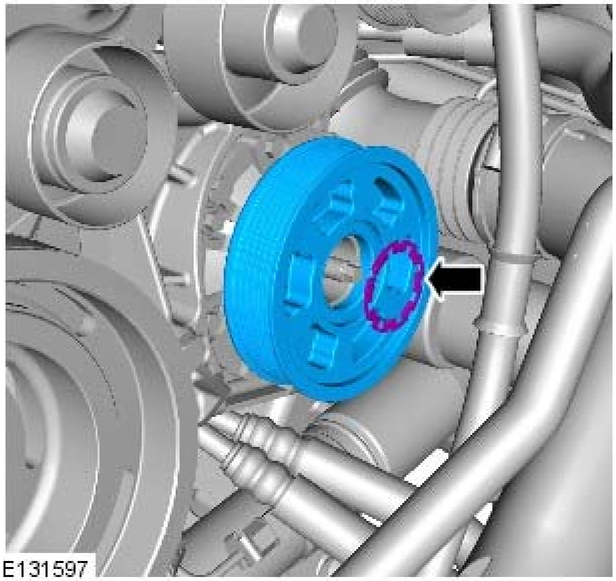


5. Remove and discard the hub assembly.

- Rotate the pulley counter-clockwise, until the hub is released from the pulley.
- Discard the rubber dampers.



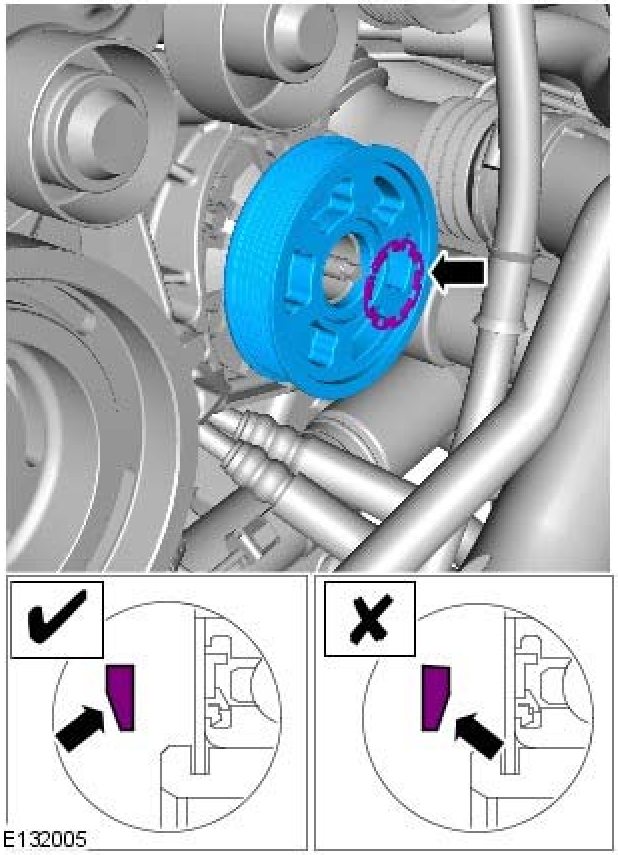
6. Remove and discard the spacer.



7. Remove and discard the drive pulley.

- Remove and discard the circlip.
- Clean the compressor mating surface.

Installation



E132005

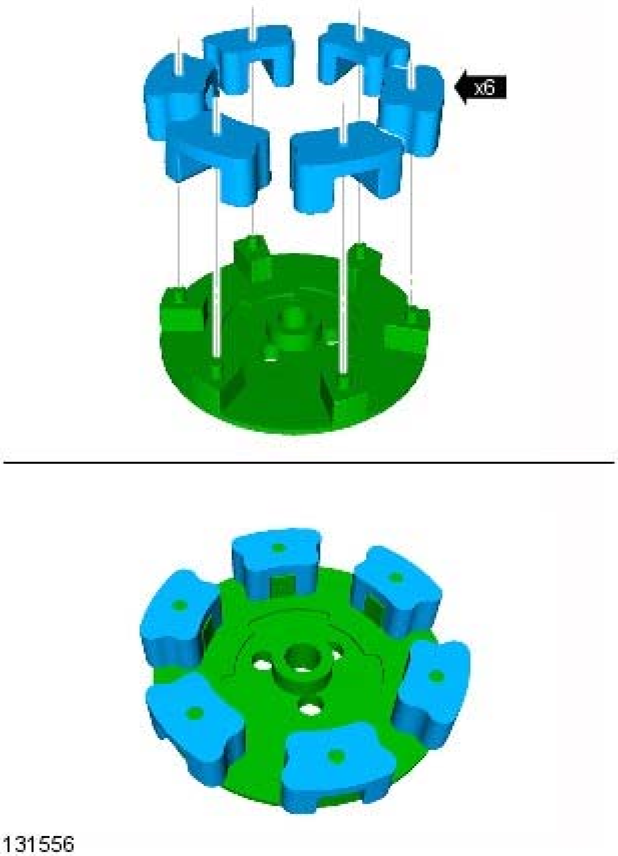
1. ⚠CAUTION: Make sure the circlip is fitted in the correct orientation.

Install the drive pulley.

- Install the circlip.

2. Install the spacer.

- Make sure the spacer is fully seated.



E131556

3. Install the 6 rubber dampers to the hub assembly.

- Make sure the dampers are installed in the correct orientation.

4. NOTE: Apply a suitable water based lubricant to the rubber dampers and to the mating surfaces on pulley.

Install the hub assembly.

- Push the hub assembly onto the pulley, and rotate clockwise to screw it onto the compressor shaft.

5. NOTE: Tighten counterclockwise.

Using a suitable tool, tighten the hub locking stud.

- Prevent the pulley rotating by hand.
- Tighten to 3.5 Nm (2.6 lb.ft)

6. Install the auxiliary drive belt.

7. Install the cooling fan.For additional information, refer to: Cooling Fan (303-03E Engine Cooling - TDV8 3.6L Diesel, Removal and Installation).

8. Connect the battery ground cable. For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

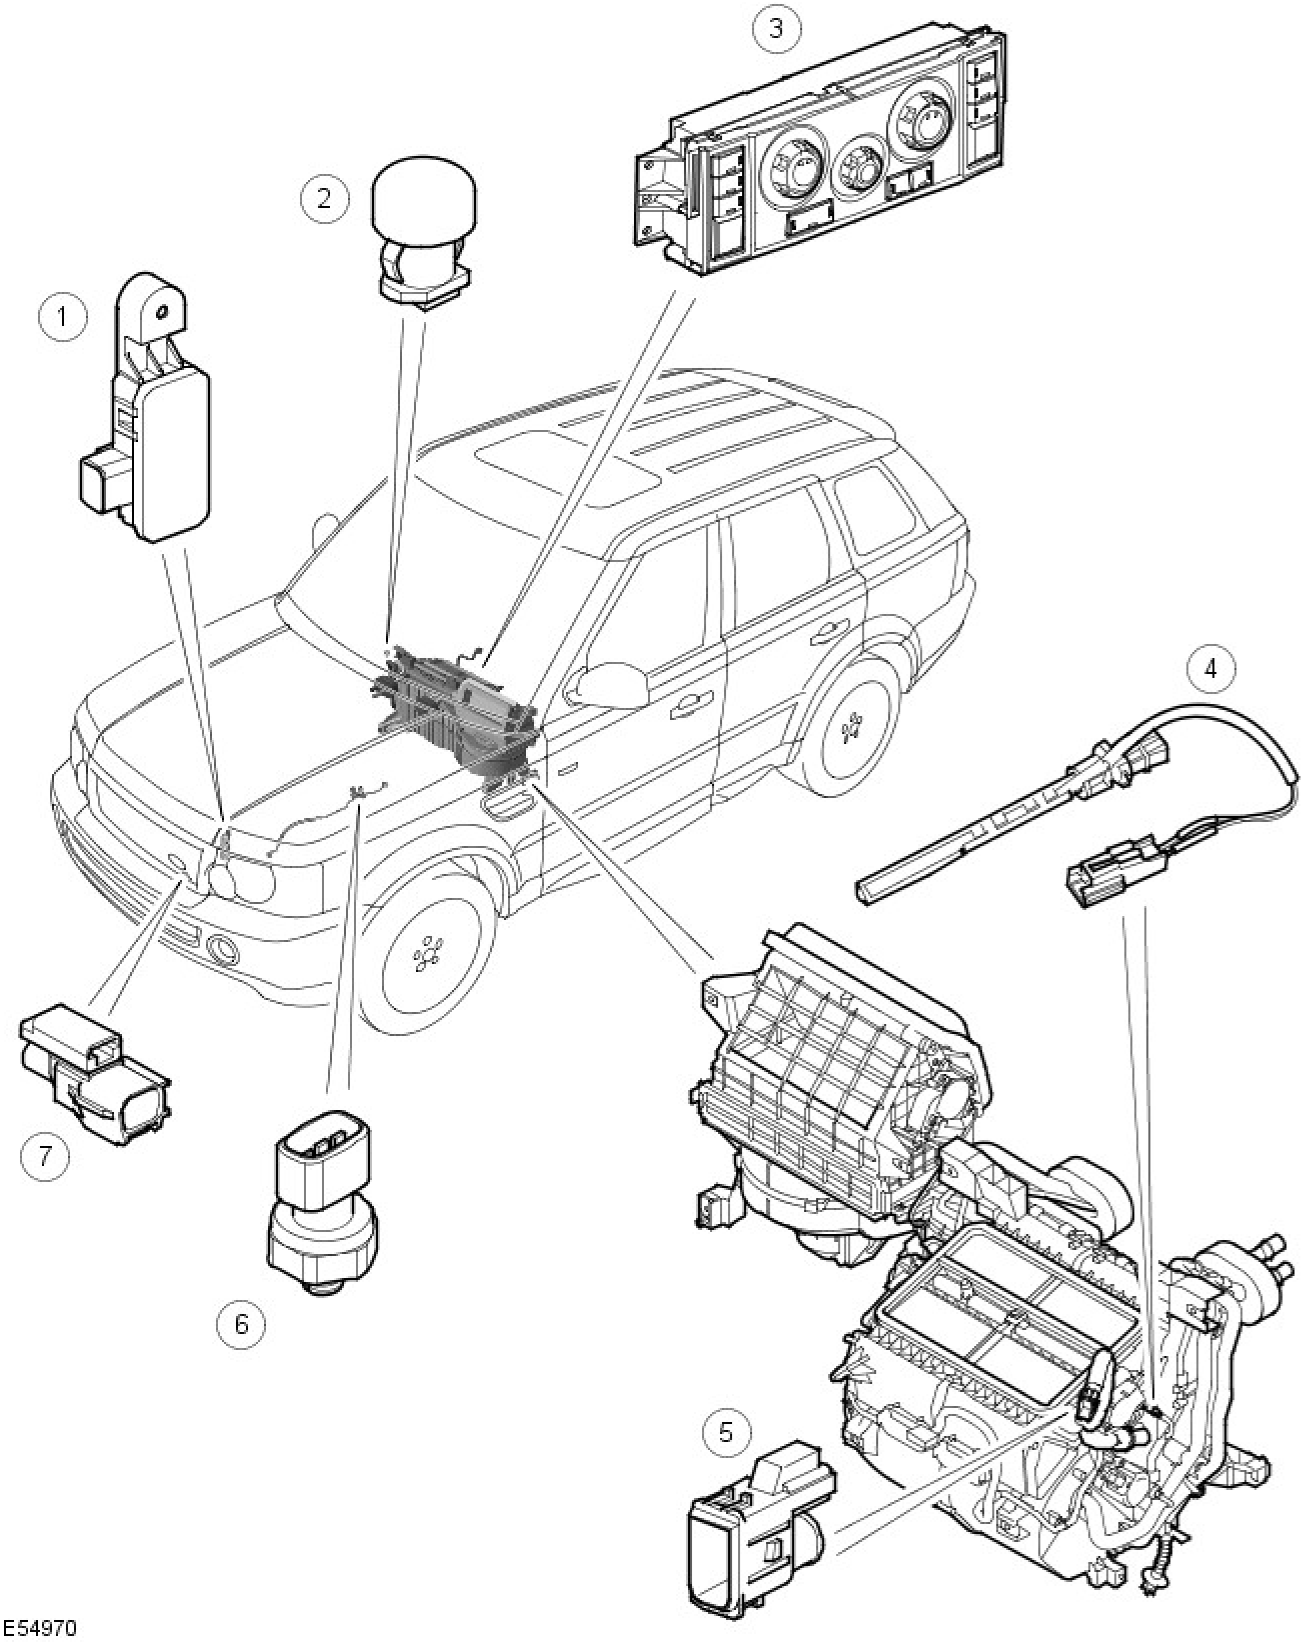
Control Components - Control Components

Description and Operation

COMPONENT LOCATIONS

- NOTE: right-hand drive (RHD) installation shown; left-hand drive (LHD) installation similar



Item	Part Number	Description
1	-	Pollution sensor (Japan only)
2	-	Sunlight sensor
3	-	automatic temperature control (ATC) module
4	-	Evaporator temperature sensor

5	-	In-vehicle temperature sensor (all except Japan), or in-vehicle temperature and humidity sensor (Japan only)
6	-	Refrigerant pressure sensor
7	-	Ambient air temperature sensor

GENERAL

The control system operates the air conditioning (A/C) system and the heating and ventilation system to control the temperature, volume and distribution of air from the heater.

The system is a dual zone system that automatically adjusts the temperature, volume and distribution of the air from the heater to maintain the individual temperature levels selected for the left-hand (LH) and right-hand (RH) sides of the passenger compartment. The system also has manual overrides for the intake air source, blower speed and air distribution. The system includes:

- An ATC module.
- An ambient temperature sensor.
- A refrigerant pressure sensor.
- An evaporator temperature sensor.
- An in-vehicle temperature sensor.
- A sunlight sensor.

Vehicles in the Japan market also incorporate:

- A pollution sensor.
- A humidity sensor.

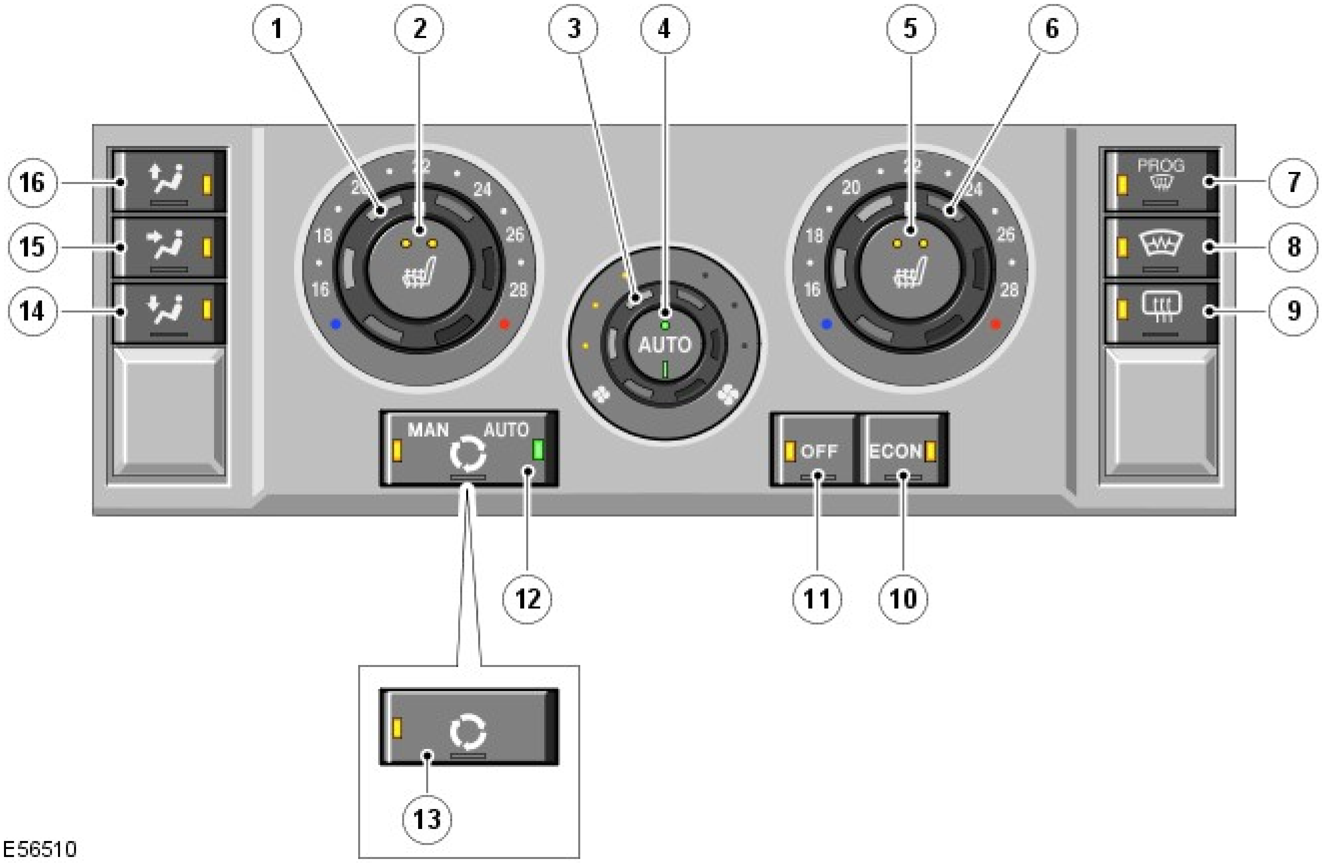
ATC MODULE

The ATC module is installed in the center console. An integral control panel contains push switches and rotary switches for system control inputs. light emitting diode (LED) in the switches and switch surrounds illuminate to indicate the current settings of the system. Switch symbols are illuminated when the side lamps or headlamps are on.

The ATC module processes inputs from the control panel switches, system sensors and the medium speed controller area network (CAN) bus, then outputs the appropriate control signals to the A/C system and the heating and ventilation system. In addition to controlling the A/C system and the heating and ventilation system, the ATC module also controls the following:

- The front seat heaters.
  For additional information, refer to: Seats (501-10 Seating, Description and Operation).
- The rear window heater.
  For additional information, refer to: Glass, Frames and Mechanisms (501-11 Glass, Frames and Mechanisms, Description and Operation).
- The windshield heater.
  For additional information, refer to: Glass, Frames and Mechanisms (501-11 Glass, Frames and Mechanisms, Description and Operation).
- The windshield washer jets and exterior mirror heaters.
  For additional information, refer to: Rear View Mirrors (501-09 Rear View Mirrors, Description and Operation).

Control Panel



Item	Part Number	Description
1	-	LH temperature switch
2	-	LH front seat heater switch
3	-	Blower switch
4	-	Automatic mode switch
5	-	RH front seat heater switch
6	-	RH temperature switch
7	-	Programmed defrost switch
8	-	Windshield heater switch
9	-	Rear window heater switch
10	-	Economy switch
11	-	System off switch
12	-	Recirculation switch (models with pollution sensing)
13	-	Recirculation switch (models without pollution sensing)
14	-	Distribution switch - feet
15	-	Distribution switch - face
16	-	Distribution switch - windshield

The switches on the ATC module control panel have the following functions:

- **LH and RH Temperature Switches:** Adjusts the nominal temperature settings of the LH and RH sides of the passenger compartment. The switch can rotate through 270°, between full cold and full hot. The switch surrounds are graduated in 2° increments between 16 and 28 °C. Minor detents define 1 °C steps over the range of the switch. Amber LEDs in the switch surround illuminate to indicate the temperature setting. When maximum cold is selected, the ATC module also automatically sets the air source to recirculated air, blower speed to maximum and distribution to face. When maximum hot is selected, the ATC module also automatically sets the air source to fresh air, blower speed to maximum and distribution to footwell.
- **LH and RH Seat Heater Switches:** Activates the heater elements in the seat cushion and seat back at one of two heat levels. The first press of the switch energizes the heater elements at the higher heat setting and illuminates two LEDs in the switch. A second press of the switch sets the heater elements to the lower heat setting and extinguishes one of the LEDs. A further press of the switch de-energizes the heater elements and extinguishes the second LED. The seat heaters remain on until selected off or the ignition is switched off.
- **Blower Switch:** For manual adjustment of blower speed. The switch can rotate through 240°, from off to maximum speed. Eight primary detents define the off position and seven blower speeds. Minor detents define small steps between the primary detents. When blower speed is manually adjusted, amber LEDs in the switch surround illuminate to indicate

the selected blower speed. The LEDs remain off when blower speed is under automatic control.

- **Automatic Mode Switch:** Activates the automatic modes for the A/C system, blower speed and distribution. Separate amber LEDs in the automatic mode switch illuminate to show when the blower and the distribution are in automatic mode. Manually selecting the blower speed or a distribution switch extinguishes the related LED.
- **Programmed Defrost Switch:** Activates a program that automatically selects: inlet air to fresh air; distribution to screen only; blower to speed 5; rear screen heater on; windshield heater on (where fitted), A/C system to automatic mode. An amber LED in the switch is illuminated while the defrost program is active.
- **Windshield Heater Switch:** Energizes the windshield heater for a set time period, until the switch is pressed again or until the engine stops, whichever occurs first. An amber LED in the switch is illuminated while the heater is on.
- **Rear Window Heater Switch:** Enabled only with the engine running. Pressing the switch energizes the rear window heater for a set time period, until the switch is pressed again or until the engine stops, whichever occurs first. An amber LED in the switch is illuminated while the heater is on.
- **Off Switch:** Switches off all of the functions controlled by the ATC module (all tell-tale LEDs are extinguished). The temperature blend door is set to the full cold position (if the A/C system is in the automatic mode, if the A/C system is in the economy mode the current door position is retained); the air source is set to recirculation; the current distribution settings are retained; the blower speed is set to zero. Where fitted, the seat heater switches can still be operated without re-activating the ATC module. The ATC module is re-activated, with all functions in the previous operating state, by a second press of the off switch or by pressing the economy switch. The ATC module can also be re-activated, with the associated effect, by the following switches:
    - The automatic mode switch.
    - Any air distribution switch.
    - The blower switch.
    - The programmed defrost switch.
    - The recirculation switch.
- **Economy Switch:** Reduces the A/C compressor output to a minimum displacement condition x 5%, reducing the engine load required to operate the A/C compressor. An amber LED in the switch is illuminated when the economy mode is selected on.
- **Recirculation Switch:** For selection of fresh or recirculated air. On models without pollution sensing, an amber LED in the switch is illuminated when recirculated air is selected. On models with pollution sensing, the recirculation switch incorporates two amber LED. The first press of the switch sets the recirculation flaps to automatic mode and illuminates one LED. A second press of the switch manually selects recirculated air and illuminates the second LED. A further press of the switch manually selects fresh air and extinguishes the two LEDs.
- **Distribution Switches (Windshield, Face and Footwell):** For manual selection of air distribution in any combination of windshield, face and footwell outlets. Each switch has a LED which illuminates when the related distribution mode is selected.

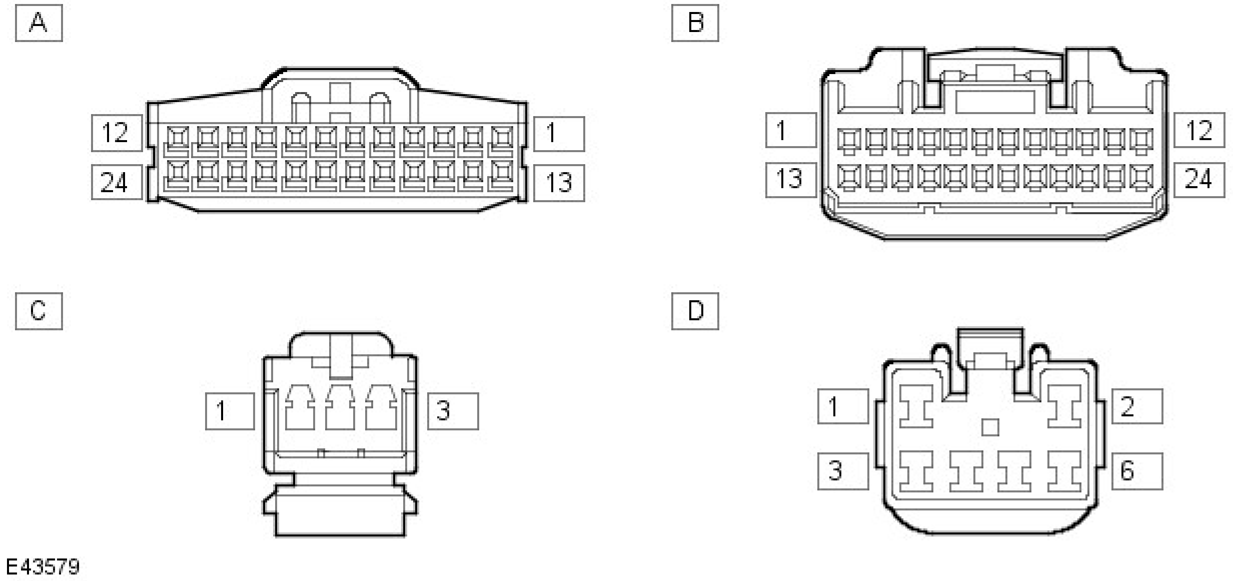
Inputs and Outputs

Four electrical connectors provide the interface between the ATC module and the vehicle wiring.

The control system sensors provide hardwired inputs to the ATC module. The ATC module also uses the LIN (local interconnect network) bus to communicate with the door motors in the heater assembly, and the medium speed CAN bus to communicate with other control modules on the vehicle.
For additional information, refer to: Communications Network (418-00 Module Communications Network, Description and Operation).

ATC Module Harness Connectors

• NOTE: A = C1629; B = C1630; C = C2655; D = C2295



ATC Module Harness Connector C1629 Pin Details

Pin No.	Description	Input/Output
1	Sensor 5V reference voltage (refrigerant pressure and sunlight)	Output
2	Pollution sensor oxides of nitrogen (NOX) signal (where fitted)	Input
3	In-vehicle temperature/humidity and in-vehicle temperature sensor signal	Input
4	Refrigerant pressure sensor signal	Input
5	Sunlight sensor RH signal	Input
6	Not used	-
7	Blower relay coil	Output
8	Not used	-
9	Medium speed CAN bus low	Input/Output
10	Medium speed CAN bus high	Input/Output
11	Pollution sensor power supply (where fitted)	Output
12	Not used	-
13	Sensor ground (refrigerant pressure, ambient air temperature, pollution, in-vehicle temperature/ humidity and in-vehicle temperature, and front seat temperature, as applicable)	Input
14	Pollution sensor hydrocarbon (HC)/carbon monoxide (CO) signal (where fitted)	Input
15	Ambient air temperature sensor signal	Input
16	Not used	-
17	Sunlight sensor LH signal	Input
18	Windshield heater relay	Input
19	Washer jets/exterior mirrors heater relay	Input
20	Not used	-
21	Medium speed CAN bus low	Input/Output
22	Medium speed CAN bus high	Input/Output
23	Compressor solenoid valve -	Input
24	Compressor solenoid valve +	Output

ATC Module Harness Connector C1630 Pin Details

Pin No.	Description	Input/Output
1	Sensor power supply (evaporator temperature, recirculation motor feedback, heater temperature)	Output

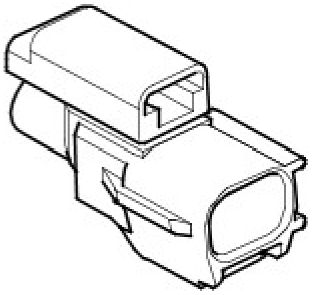
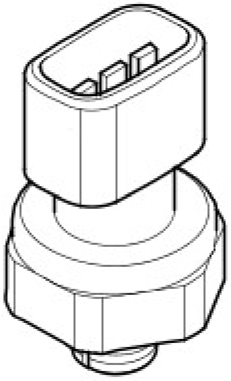
AMBIENT AIR TEMPERATURE SENSOR



E43580

The ambient air temperature sensor is a negative temperature coefficient (NTC) thermistor that provides the ATC module with an input of external air temperature. The sensor is attached to a bracket on the rear of the bumper beam, on the vehicle center-line.

REFRIGERANT PRESSURE SENSOR



E43581

The refrigerant pressure sensor provides the ATC module with a pressure input from the high pressure side of the refrigerant system. The refrigerant pressure sensor is located in the refrigerant line between the condenser and the thermostatic expansion valve.

The ATC module supplies a 5 V reference voltage to the refrigerant pressure sensor and receives a return signal voltage, between

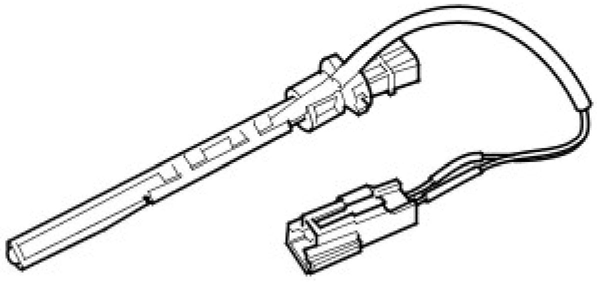
0 and 5 V, related to system pressure.

The ATC module uses the signal from the refrigerant pressure sensor to protect the refrigerant system from extremes of pressure and to calculate A/C compressor load on the engine. The ATC module also transmits the A/C compressor load value to the engine control module (ECM), via the medium speed CAN bus, instrument cluster and high speed CAN bus, for use in controlling the speed of the engine cooling fan.

To protect the system from extremes of pressure, the ATC module sets the A/C compressor to the minimum flow position if the pressure:

- Decreases to 1.9 ± 0.2 bar (27.5 ± 3 lbf/in^2); the ATC module loads the A/C compressor again when the pressure increases to 2.8 ± 0.2 bar (40.5 ± 3 lbf/in^2).
- Increases to 33 ± 1 bar (479 ± 14.5 lbf/in^2); the ATC module loads the A/C compressor again when the pressure decreases to 23.5 ± 1 bar (341 ± 14.5 lbf/in^2).

EVAPORATOR TEMPERATURE SENSOR

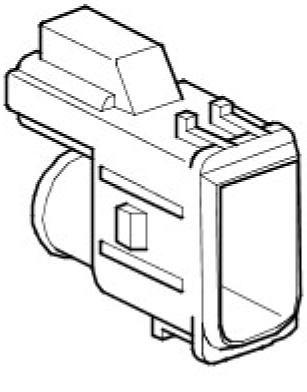


E43582

The evaporator temperature sensor is a NTC thermistor that provides the ATC module with a temperature signal from the downstream side of the evaporator. The evaporator temperature sensor is installed in the right side of the heater assembly casing.

The ATC module uses the input from the evaporator temperature sensor to control the load of the A/C compressor and thus the operating temperature of the evaporator.

IN-VEHICLE TEMPERATURE SENSOR



E43583

The in-vehicle temperature sensor is a NTC thermistor installed behind a grill in the instrument panel, on the inboard side of the steering column. The sensor is connected to a tube, the other end of which is connected to a venturi on the side casing of the heater. An air bleed from the heater, through the venturi, induces a flow of air down the tube, which draws cabin air through the grill and over the sensor.

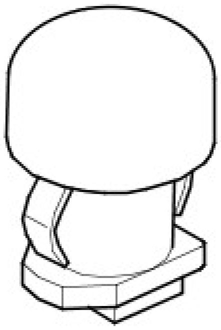
HUMIDITY SENSOR (WHERE FITTED)

The humidity sensor is a capacitive device integrated into the in-vehicle temperature sensor (see above).

The humidity sensor element is constructed from film capacitors on different substrates. The dielectric is a polymer which absorbs or releases water proportional to the relative humidity of the air being drawn through the sensor, and thus changes the capacitance of the capacitor. For protection, the sensor element is contained in a nylon mesh cover.

The humidity sensor and the in-vehicle temperature sensor are connected to a PCB (printed circuit board) inside the sensor housing. The PCB is powered by a 5V feed from the ATC module. Separate signals of temperature and relative humidity are transmitted from the PCB to the ATC module.

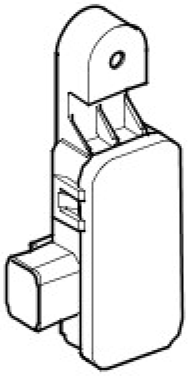
SUNLIGHT SENSOR



E43585

The sunlight sensor consists of two photoelectric cells that provide the ATC module with inputs of light intensity, one as sensed coming from the left of the vehicle and one as sensed coming from the right. The inputs are a measure of the solar heating effect on vehicle occupants, and are used by the ATC module to adjust blower speed, temperature and distribution to improve comfort. The sensor is installed in the center of the instrument panel upper surface and is powered by a 5V feed from the ATC module.

POLLUTION SENSOR (WHERE FITTED)



E43588

The pollution sensor allows the ATC module to monitor the ambient air for the level of hydrocarbons and oxidized gases such as nitrous oxides, sulphur oxides and carbon monoxide. The sensor is attached to a bracket on the front-end carrier, at the top left corner of the condenser.

The pollution sensor is powered by a battery voltage feed from the ATC module, and returns separate signals of hydrocarbon and oxidized gases.

If there is a fault with the pollution sensor, the ATC module disables the automatic operation of the recirculation door.

SYSTEM OPERATION

A/C Compressor Control

The variable displacement A/C compressor is permanently driven by the engine. The flow of refrigerant through the A/C compressor, and the resultant system pressure and evaporator operating temperature, is regulated by the refrigerant solenoid valve. Operation of the refrigerant solenoid valve is controlled by the ATC module using a 400 Hz pulse width modulation (PWM) signal. The duty cycle of the PWM signal is calculated using the following parameters:

- A/C compressor torque.
- A/C compressor torque maximum.
- A/C cooling status.
- A/C demand.
- A/C refrigerant pressure.

- Ambient air temperature.
- Blower speed.
- Engine cranking status.
- Evaporator temperature.
- Transmission gear status.

When A/C is selected, the ATC module maintains the evaporator at an operating temperature that varies with the in-vehicle cooling requirement. The ATC module increases the evaporator operating temperature, by reducing the refrigerant flow, as the requirement for air cooling decreases, and vice versa. During an increase of evaporator operating temperature, to avoid compromising the dehumidification function, the ATC module controls the rate of temperature increase, which keeps the cabin humidity at a comfortable level.

When the economy mode is selected, the PWM signal holds the refrigerant solenoid valve in the minimum flow position, effectively switching off the A/C function.

The ATC module incorporates limits for the operating pressure of the refrigerant system. When the system approaches the high pressure limit, the duty cycle of the PWM signal is progressively reduced until the system pressure decreases. When the system pressure falls below the low pressure limit, the duty cycle of the PWM signal is held at its lowest setting, so that the A/C compressor is maintained at the minimum stroke, to avoid depletion of lubricant from the A/C compressor. The protection algorithm is calculated at a high rate, to enable early detection of the rapid pressure changes possible if a system fault develops.

A/C Compressor Torque

The ATC module uses refrigerant pressure, evaporator temperature and engine speed to calculate the torque being used to drive the A/C compressor. The calculated value is broadcast on the medium speed CAN bus for the ECM, which uses the calculated value for idle speed control and fueling control. The ATC module also compares the calculated value with a maximum A/C compressor torque value received from the ECM over the medium speed CAN bus. If the calculated value exceeds the maximum value, the ATC module signals the refrigerant solenoid valve to reduce the refrigerant flow and so reduce the torque being used to drive the A/C compressor. By reducing the maximum A/C compressor torque value, the ECM is able to reduce the load on the engine when it needs to maintain vehicle performance or cooling system integrity.

Idle Speed Control

In order to maintain A/C cooling performance, the ATC module requests an increase in engine idle speed if the evaporator temperature starts to rise while the refrigerant solenoid valve is already set to the maximum flow rate. The increase in engine idle speed is requested in three stages, using a medium speed CAN bus message to the ECM. For additional information, refer to:

Electronic Engine Controls (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, Description and Operation),
Electronic Engine Controls (303-14B Electronic Engine Controls - V8 4.4L Petrol, Description and Operation),
Electronic Engine Controls (303-14C Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

The need for a change in idle speed is determined as follows:

- If the evaporator temperature increases by 3 °C (5.4 °F), or to 6 °C (10.8 °F) above the target operating temperature, over a 10 seconds period, the first stage of idle speed increase is requested.
- When the first stage of idle speed increase is set, if the evaporator temperature increases by 3 °C (5.4 °F), or increases to 12 °C (21.6 °F) above the target operating temperature, over a 9 seconds period, the second stage of idle speed increase is requested.
- When the second stage of idle speed increase is set, if the evaporator temperature increases by 3 °C (5.4 °F), or increases to 15 °C (27 °F) above the target operating temperature, over a 10 seconds period, the third stage of idle speed increase is requested.
- When an idle speed increase is set, if the evaporator temperature decreases by 3 °C (5.4 °F) over a 10 seconds period, the next stage down of idle speed increase is requested.

Electrical Load Management

The ATC module manages the vehicle electrical loads to:

- Maintain the vehicle battery in a healthy state of charge.
- Ensure adequate power is available for defrost demisting during engine warm-up.
- Ensure adequate power is available for A/C during extended periods with the engine at idle speed.
- To maintain system voltage within acceptable limits.
- To provide adequate power to meet customer expectations.

Electrical load management is achieved by increasing the engine idle speed and controlling the electrical load of systems that do not affect the driveability or safety of the vehicle.

During the engine warm-up period, the ATC module manages the electrical load to make sure that the battery voltage is maintained above a pre-determined level. The battery voltage level that is maintained and the duration of the start period varies with ambient air temperature and engine coolant temperature (ECT). After the engine warm-up period, the ATC module manages the electrical load to make sure that the requested electrical load does not exceed the generator output.

The duration of the engine warm-up period depends on the ambient air temperature and the ECT when the ignition is switched on, as detailed in the following table:

Engine Warm-up Times

Ambient Air Temperature, °C (°F)	ECT, °C (°F)			
	<10 (<50)	>10 to <30 (>50 to <86)	>30 to <60 (>86 to <140)	>60 (>140)
		Warm-up Period, Minutes		
>10 (>50)	15	15	15	15
>5 to <10 (>41 to <50)	15	15	15	15
>0 to <5 (>32 to <41)	10	15	15	15
>-10 to <0 (>14 to <32)	10	10	15	15
<-10 (<14)	5	5	10	15

The ATC module calculates the electrical load from the battery voltage and generator output voltage, and compares the result against the maximum load available from the generator. The calculation is averaged across the first 20 seconds after the engine starts, and subsequently averaged every 60 seconds. When the ignition is turned off, the ATC module stores the status of the electrical load management for 20 seconds. If the engine is re-started within the 20 seconds, the ATC module resumes electrical load management using the stored status. If the engine is re-started after the 20 seconds, the timers are reset and the ATC module re-calculates the status.

If the electrical load is more than the maximum load available, the ATC module requests an increase of engine idle speed using the medium speed CAN bus message to the ECM. If an electrical load imbalance remains after an increase in engine idle speed, or if the electrical load is more than the capacity of the charging system, the ATC module reduces the electrical load by reducing the power of some vehicle systems or inhibiting their operation. The number of systems controlled depends on the electrical load reduction required. The systems controlled, and the order in which their power is reduced or they are inhibited, are contained in three priority tables. The table used depends on the ambient air temperature, battery temperature and ECT:

- The cold start table is used when the ambient air temperature is less than 5 °C (41 °F) and the ECT is less than 30 °C (86 °F).
- The hot start table is used when the ambient air temperature is 5 °C (41 °F) or more and the ECT is less than 30 °C (86 °F).
- The continuous table is used when battery temperature is more than 5 °C (41 °F) and the ECT is more than 50 °C (122 °F).
- If none of above conditions are met, the ATC module adopts the last used table.

Cold Start Electrical Load Management

Priority		System
Power Reduction	Inhibited	
1	-	Air suspension
2	-	Front seat heaters
3	-	Entertainment system
-	4	Front seat heaters
5	-	Rear window heater
6	-	Windshield washer jet and exterior mirror heaters
-	7	Windshield washer jet and exterior mirror heaters
8	-	Windshield heater
9	-	Climate control blower
-	10	Rear window heater
-	11	Windshield heater

Hot Start Electrical Load Management

Priority		System
Power Reduction	Inhibited	
-	1	Front seat heaters; windshield washer jet and exterior mirror heaters
2	-	Windshield heater
3	-	Rear window heater
4	-	Air suspension
5	-	Entertainment system
-	6	Windshield heater
-	7	Rear window heater

Continuous Electrical Load Management

Priority		System
Power Reduction	Inhibited	
-	1	Front seat heaters
2	-	Windshield heater
3	-	Rear window heater
4	-	Air suspension

Priority		System
Power Reduction	Inhibited	
5	-	Entertainment system

Engine idle speed changes, and electrical load changes of systems not under direct control of the ATC module (air suspension and entertainment), are initiated using the appropriate medium speed CAN bus message. When partial operation is requested:

- The air suspension system still performs height changes but reduces air compressor operation by not replenishing the reservoir.
- The entertainment system restricts the maximum volume level and reduces the output frequency bandwidth.

Cooling Fan Control

The ATC module determines the amount of condenser cooling required from the refrigerant pressure, since there is a direct relationship between the temperature and pressure of the refrigerant. The cooling requirement is transmitted to the ECM in a medium speed CAN bus message. The ECM controls the condenser cooling using the cooling fan. For additional information, refer to:

> Electronic Engine Controls (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, Description and Operation),
> Electronic Engine Controls (303-14B Electronic Engine Controls - V8 4.4L Petrol, Description and Operation),
> Electronic Engine Controls (303-14C Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

Air Temperature Control

Air from the evaporator enters the heater assembly, where temperature blend doors direct a proportion of the air through the heater core to produce the required discharge air temperature. The two temperature blend doors operate independently to enable independent temperature selection for the left and right sides of the vehicle interior. The temperature blend doors are operated by stepper motors. The stepper motors are controlled by the ATC module using LIN bus messages.

The ATC module calculates the stepper motor position required to achieve the selected temperature and compares it against the current position, which is stored in memory. If there is any difference, the ATC module signals the stepper motor to adopt the new position.

Air temperature is controlled automatically unless maximum heating or maximum cooling is selected. The required air temperature may be adjusted between 16 °C (61 °F) and 28 °C (82 °F) using the air temperature control switches. The control algorithms then attempt to maintain the desired set temperature.

Turning the temperature switches fully counterclockwise gives maximum available cooling. Turning the temperature switches fully clockwise gives maximum available heating. When maximum cooling or maximum heating is selected, the comfort algorithm adopts an appropriate strategy for the air distribution, blower speed,

A/C and air source functions, except where a function is under manual control.

The temperature control of one zone can be compromised by the other zone being set to maximum heating or maximum cooling. True maximum heating or maximum cooling can only be obtained with both controls set to the same maximum state.

When the economy mode is selected, the automatic temperature control function still operates, but with no cooling capability the minimum discharge temperature achievable will be ambient air temperature plus any heat pick up in the air intake path.

Air Distribution Control

When the A/C is in the automatic mode, the ATC module automatically controls air distribution according to a comfort strategy. Automatic control is overridden when one of the manual modes is selected. Air distribution remains manually controlled until the automatic mode is selected again. The distribution doors are operated by two stepper motors, which are controlled by the ATC module using LIN bus messages.

Blower Control

When A/C is selected or the blower speed is manually selected, the ATC module energizes the coil of the blower relay in the battery junction box (BJB). The energized blower relay supplies battery power to the blower motor, which is grounded through the blower control module. The speed of the blower is controlled by a PWM signal from the ATC module to the blower control module. The blower control module regulates the blower motor voltage in relation to the PWM signal.

When the blower is in the automatic mode the ATC module determines the blower speed required from the comfort algorithms. When the blower is in the manual mode, the ATC module operates the blower at one of seven fixed speeds as selected on the control panel.

Programmed Defrost

The programmed defrost function automatically provides the maximum defrosting of the vehicle. When the programmed defrost function is selected, the ATC module configures the control system as follows:

- Automatic mode off.

- Air inlet to fresh air, manual control.
- Selected temperature unchanged, automatic control.
- Air distribution set to screen mode, manual control.
- Blower speed set to speed 5, manual control.
- Rear screen heater and windshield heater (if applicable) selected on.
- A/C mode in automatic.

The programmed defrost function is cancelled by one of the following:

- Selecting any distribution switch. The system response will be identical to the normal manual distribution control operation.
- Selecting the automatic switch. This will restore the system to fully automatic operation.
- Selecting the programmed defrost switch again. This returns the system to the state in use immediately before the programmed defrost function was first selected.
- Turning the ignition off.

The blower speed can be adjusted manually without terminating the programmed defrost function.

Intake Air Control

The source of intake air is automatically controlled unless overridden by manual selection of recirculation. Under automatic control the ATC module determines the required position of the recirculation door from the comfort strategy and the input from the pollution sensor (if fitted). The recirculation door is operated by an electric motor, which is controlled by hardwired analogue signals from the ATC module. A potentiometer in the motor supplies the ATC module with a position feedback signal for closed loop control.

Provided the intake air has not been manually selected to recirculation, the ATC module adjusts the recirculation door to reduce the ram effect produced by the forward motion of the vehicle.

When the ignition switch is turned off, the ATC module evaluates the ambient air temperature. If the ambient air temperature is less than a pre-determined value, the intake air source is set to recirculation, to prevent the ingress of damp air while the vehicle is parked.

When the vehicle is in the transportation mode, the ATC module sets the intake door to recirculation every time the ignition is turned off, regardless of the ambient air temperature.

Pollution Sensing

With a pollution sensor fitted to the vehicle, the ATC module controls the intake air source to reduce contamination of the intake air by external pollutants. This function is fully automatic, but can be overridden by manual selection of the intake air source.

Humidity Sensing

With a humidity sensor fitted, the ATC module controls the moisture content of the air in the vehicle. This is achieved by raising the evaporator temperature to increase the humidity of the air entering the vehicle, and reducing the evaporator temperature to reduce the humidity of the air entering the vehicle.

Front Seat Heaters

The front seat heaters are enabled when the ignition switch is position II, and operate at one of two temperature settings. With the first press of a front seat heater switch the ATC module adopts the higher temperature setting, supplies a power feed to the related front seat heater elements and illuminates two amber LEDs in the switch. At the second press of the switch the ATC module adopts the lower temperature setting and extinguishes one of the LEDs. At the third press of the switch the ATC module de-energizes the heater elements and extinguishes the second LED. The seat heaters remain on until selected off or the ignition is turned off.

The ATC module receives an input from a temperature sensor in each front seat, and regulates the power feed of the heater elements to control the seat temperature at the appropriate temperature setting between 35 and 45 °C (95 and 113 °F). The actual temperature settings vary with the type of seat covering, to allow for the different heat conduction properties of the different materials.

When the front seat heaters are activated at the higher temperature setting, the ATC module automatically resets them to the lower temperature after a time delay. The length of the time delay depends on the in-vehicle temperature.

Temperature Reset Time Delay

In-vehicle Temperature, °C (°F)	<-15 (5)	-15 to -10 (5 to 14)	-10 to 0 (14 to 32)	0 to 15 (32 to 59)	15 to 25 (59 to 77)	>25 (77)
Time Delay, minutes	Remains at higher temperature until manually de-selected	20	15	10	5	3

To protect the heater elements, the ATC module disables front seat heating if battery voltage exceeds 16.5 ± 0.3 V for more than 5 seconds. Front seat heating is re-enabled when battery voltage decreases to 16.2 ± 0.3 V.

The ATC module monitors the power feeds to the heater elements and disables the applicable front seat heating if a short or open circuit is detected. The ATC module also disables seat heating if the seat temperature rises significantly above the target temperature setting.

The plausibility of the temperature sensor inputs is also monitored by the ATC module. When seat heating is selected, if one of the temperature sensor inputs is within 5 °C (9 °F) below the target temperature, the ATC module monitors the sensor input for a temperature increase and checks that it is between the minimum and maximum working temperatures. If a temperature sensor input is at the high end of the working range, while the ambient air temperature and the engine temperature are within 10 °C (18 °F) of each other, the ATC module disables front seat heating until the input decreases below the target temperature setting. The ATC module interprets a temperature sensor input value of -45 °C (-49 °F) or below as an open circuit, and temperature sensor input value of 100 °C (212 °F) or more as a short circuit.

Rear Window Heater

The ATC module controls operation of the rear window heater using medium speed CAN messages to operate the rear window heater relay in the central junction box (CJB). The control module in the CJB interprets the CAN messages and switches the ground connection of the relay coil to operate the rear window heater. While the rear window heater relay is energized, a battery power feed is connected to the rear window heater elements. Rear window heater operation is only enabled when the engine is running.

The ATC module operates the rear window heater in heating cycles of varying power and time. The heating cycle used depends on the ambient air temperature and whether it is the initial or subsequent operation during the current ignition cycle.

When the rear window heater switch is pressed, the ATC module illuminates an LED in the switch and initiates the appropriate heating cycle. The LED remains illuminated until the rear window heater is selected off, the heating cycle is completed or the engine stops. If the engine stalls or the ignition is turned off, rear window heating resumes if the engine is re-started within 20 seconds.

On the initial selection of rear window heating, the ATC module uses a short or long defrost phase at full power, followed by a low power phase. The defrost phase used depends on the ambient temperature. During the low power phase, the rear window heater relay is cycled off for 80 seconds and on for 40 seconds.

On subsequent operations, during the same ignition cycle, the ATC module operates the rear window heater at full power for a fixed time period.

Rear Window Heating Phases

Phase	Time, minutes
Short defrost (-5°C (23°F) and above)	10
Long defrost (less than -5°C (23°F))	15
Low power	20
Subsequent operation	10

Windshield Heater

The ATC module controls operation of the windshield heater using the windshield heater relay in the BJB. The ATC module switches the ground connection of the relay coil to operate the windshield heater. While the windshield heater relay is energized, a battery power feed is connected to each of the two windshield heater elements. Windshield heater operation is only enabled when the engine is running.

The ATC module operates the windshield heater in heating cycles of varying power and time. The heating cycle used depends on the ambient air temperature and whether it is the initial or subsequent operation during the current ignition cycle.

When the windshield heater switch is pressed, the ATC module illuminates a LED in the switch and initiates the appropriate heating cycle. The LED remains illuminated until the windshield heater is selected off, the heating cycle is completed or the engine stops. If the engine stalls or the ignition is turned off, windshield heating resumes if the engine is re-started within 20 seconds.

On the initial selection of the windshield heater, the ATC module uses a short or long defrost phase at full power, followed by a low power phase. The defrost phase used depends on the ambient temperature. During the low power phase, the windshield heater relay is cycled off for 80 seconds and on for 40 seconds.

On subsequent operations, during the same ignition cycle, the ATC module operates the windshield heater at full power for a fixed time period.

Windshield Heating Phases

Phase	Time, minutes
Short defrost (-5 °C (23 °F) and above)	3
Long defrost (less than -5 °C (23 °F))	5
Low power	10
Subsequent operation	3

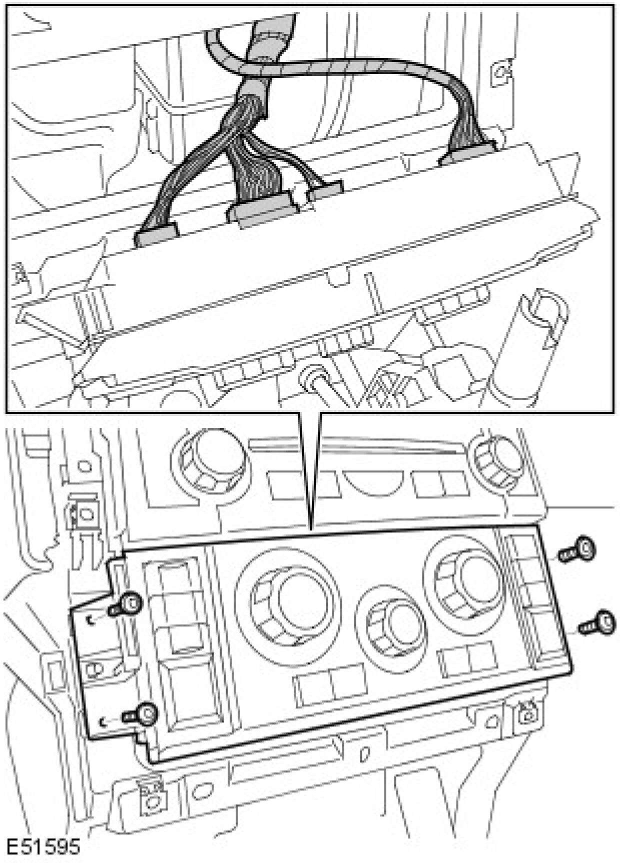
Control Components - Climate Control Assembly

Removal and Installation

Removal

1. Remove the floor console.
   For additional information, refer to: Floor Console (501-12 Instrument Panel and Console, Removal and Installation).
2. Remove the climate control assembly.
   - Remove the 4 Torx screws.
   - Disconnect the 4 electrical connectors.



Installation

1. Install the climate control assembly.
   - Connect the electrical connectors.
   - Tighten the Torx screws.
2. Install the floor console.
   For additional information, refer to: Floor Console (501-12 Instrument Panel and Console, Removal and Installation).

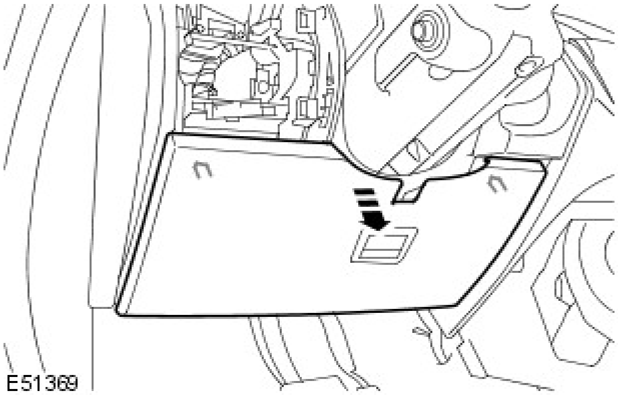
Control Components - In-Vehicle Temperature Sensor

Removal and Installation

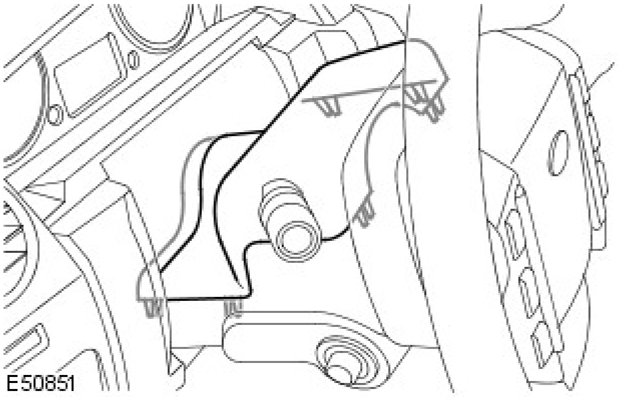
Removal

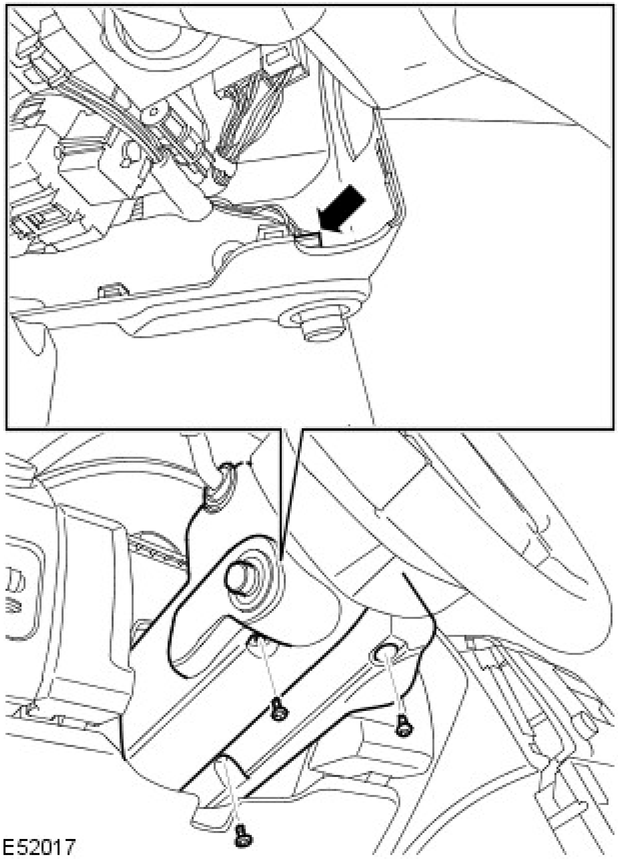
1. Fully extend the steering column for access.

2. Remove the instrument panel access panel.
   - Release the 2 clips.



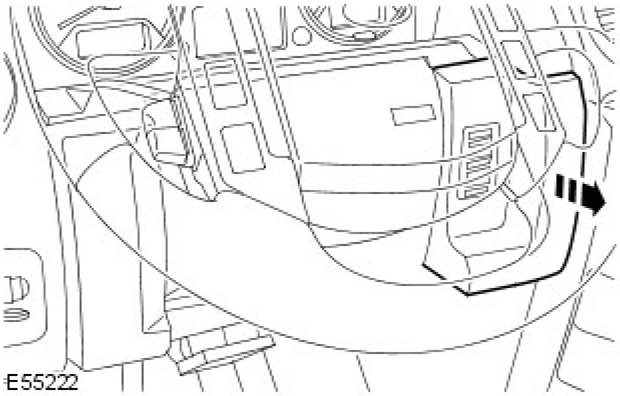
3. Remove the steering column upper shroud.
   - Release the 6 clips.





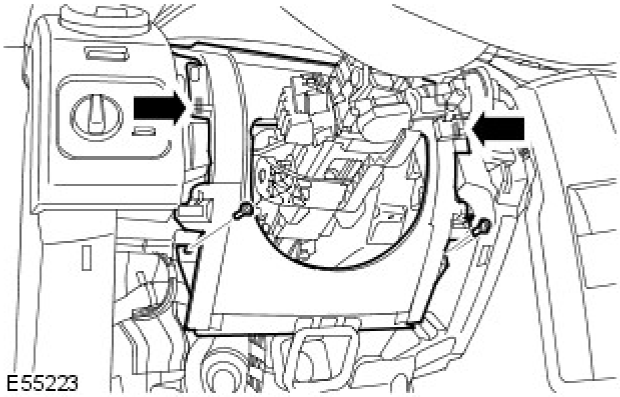
4. Remove the steering column lower shroud.

- Remove the 3 Torx screws.
- Disconnect the electrical connector.



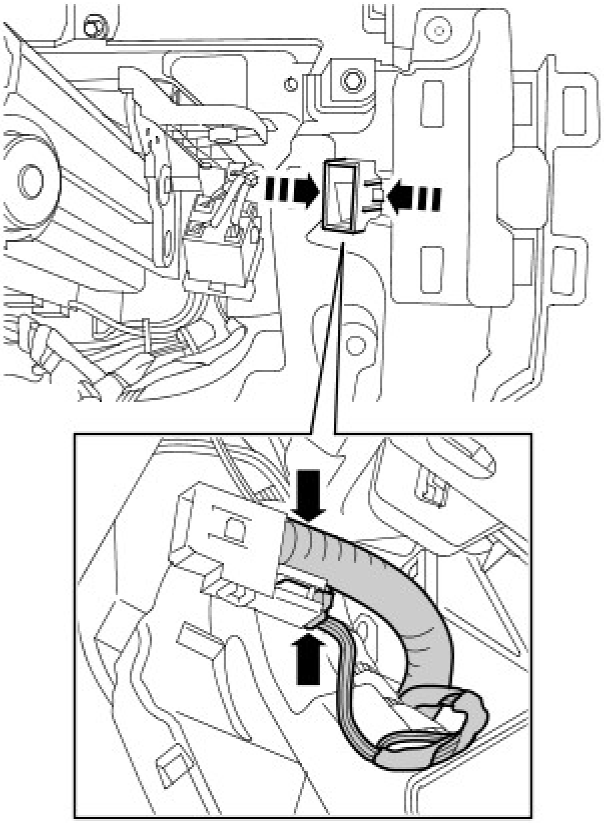
5. Remove the steering column side trim panel.

- Release the clips.
- Repeat the above procedure for the other side.



6. Release the steering column gaiter panel.

- Remove the 2 Torx screws.
- Release the 2 clips.



E55224

7. Remove the in-vehicle temperature sensor.

- Release the 2 clips.
- Disconnect the electrical connector.
- Disconnect the hose.

Installation

1. Install the in-vehicle temperature sensor.

- Connect the hose.
- Connect the electrical connector.
- Secure with the clips.

2. Install the steering column gaiter panel.

- Secure with the clips.
- Tighten the Torx screws.

3. Install the steering column side trim panels.

- Secure with the clips.

4. Install the steering column shrouds.

- Tighten the screws.
- Secure with the clips.

5. Install the instrument panel access panel.

- Secure with the clips.

Removal and Installation

Removal

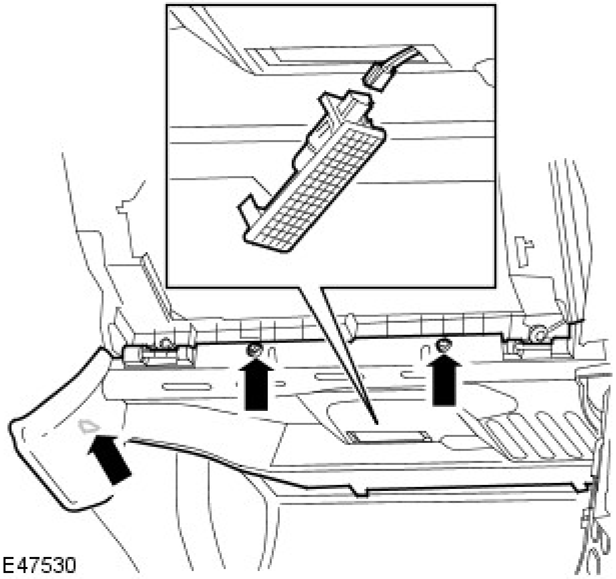
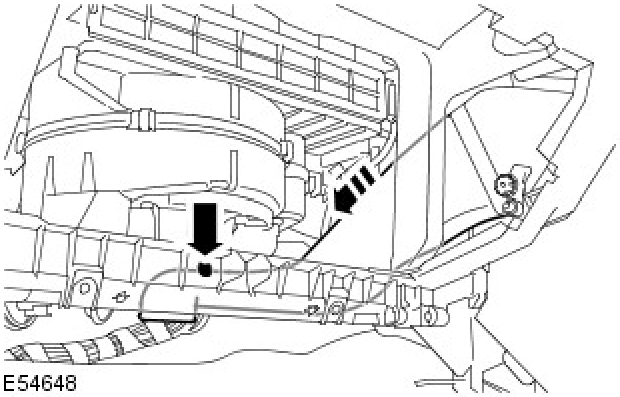
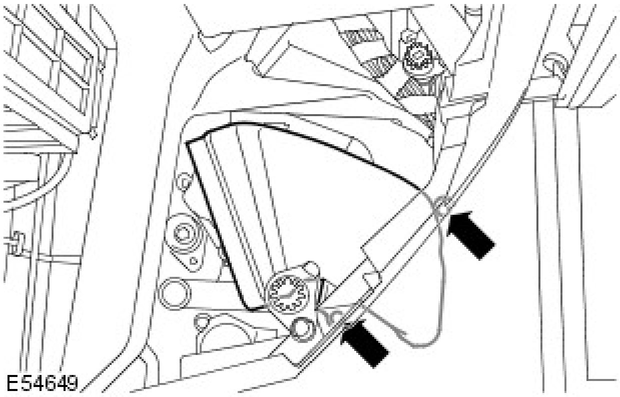
1. Remove the glove compartment.
   For additional information, refer to: Glove Compartment (501-12 Instrument Panel and Console, Removal and Installation).



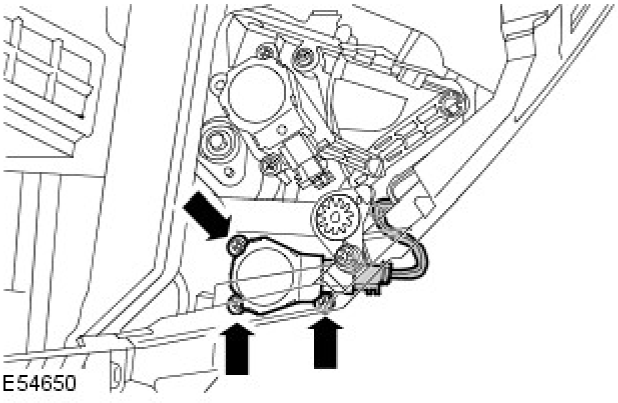
2. Remove the passenger side closing trim panel.
   - Release the clip.
   - Remove the 2 screws.
   - Disconnect the electrical connector.



3. Remove the passenger side footwell duct.
   - Remove the clip.



4. Remove the passenger side footwell duct elbow.
   - Remove the 2 Torx screws.



5. Remove the temperature blend door actuator.

- Disconnect the electrical connector.
- Remove the 2 screws.

Installation

1. Install the temperature blend door actuator.

- Tighten the screws.
- Connect the electrical connector.

2. Install the passenger side footwell duct elbow.

- Tighten the screws.

3. Install the passenger side footwell duct.

- Install the clip.

4. Install the passenger side closing trim panel.

- Connect the electrical connector.
- Tighten the screws.
- Secure the clip.

5. Install the glove compartment.
For additional information, refer to: Glove Compartment (501-12 Instrument Panel and Console, Removal and Installation).

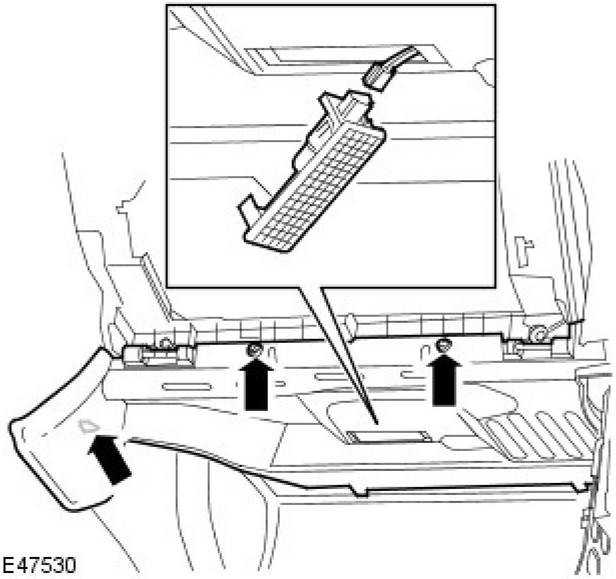
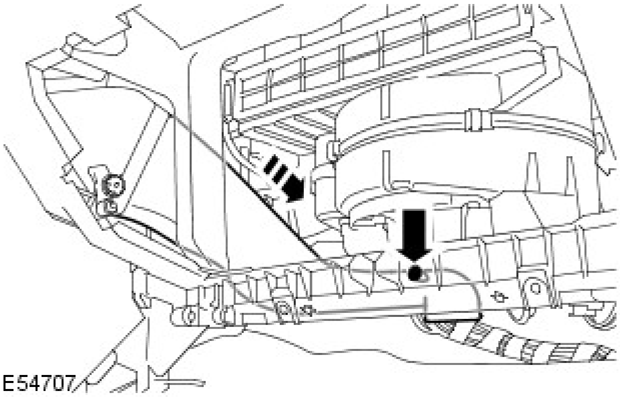
Removal and Installation

Removal

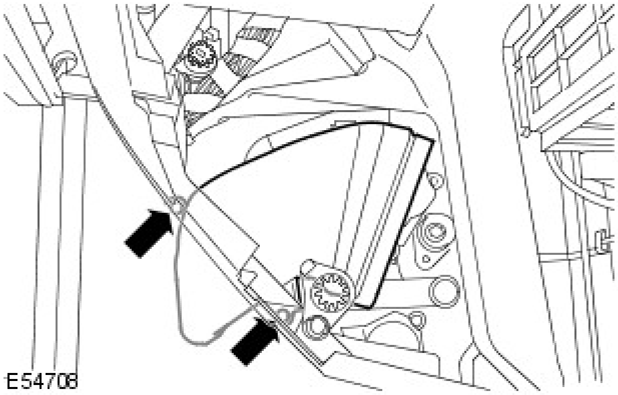
1. Remove the glove compartment.
   For additional information, refer to: Glove Compartment (501-12 Instrument Panel and Console, Removal and Installation).



2. Remove the passenger side closing trim panel.
   - Release the clip.
   - Remove the 2 screws.
   - Disconnect the electrical connector.



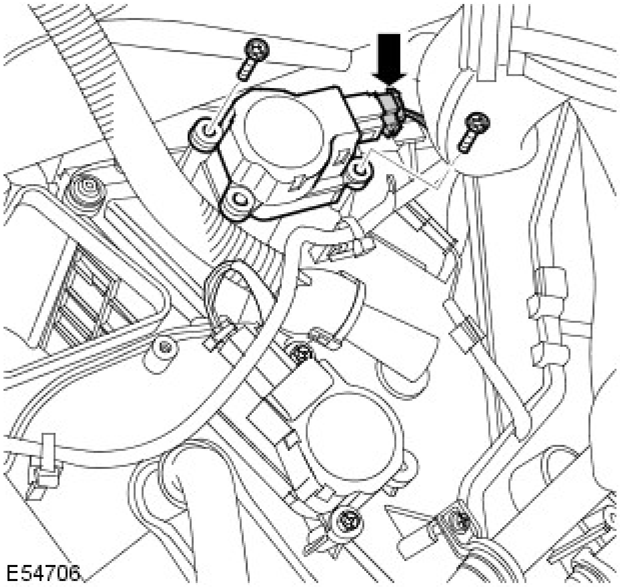
3. Remove the passenger side footwell duct.
   - Remove the clip.



4. Remove the passenger side footwell duct elbow.
   - Remove the 2 Torx screws.

5. Remove the defrost vent/register blend door actuator.

- Disconnect the electrical connector.
- Remove the 2 screws.



Installation

1. Install the defrost vent/register blend door actuator.
   - Tighten the screws to 1 Nm.
   - Connect the electrical connector.
2. Install the passenger side footwell duct elbow.
   - Tighten the screws.
3. Install the passenger side footwell duct.
   - Install the clip.
4. Install the passenger side closing trim panel.
   - Install the interior lamp.
   - Connect the electrical connector.
   - Secure the clip.
5. Install the glove compartment.
   For additional information, refer to: Glove Compartment (501-12 Instrument Panel and Console, Removal and Installation).

WARNING INDICATORS

The warning indicators are located in various positions in the instrument cluster. The warning indicators can be split into two groups; self controlled and externally controlled.

Self controlled warning indicators are dependent on software logic within the instrument pack for activation. The pack software controls the indicator check illumination at ignition on and all indicators whose operation is controlled by the instrument cluster, the low fuel level warning indicator for example.

Externally controlled indicators are supplied with current from another system controlling module or illuminated by the instrument cluster on receipt of a bus message from another subsystem module.

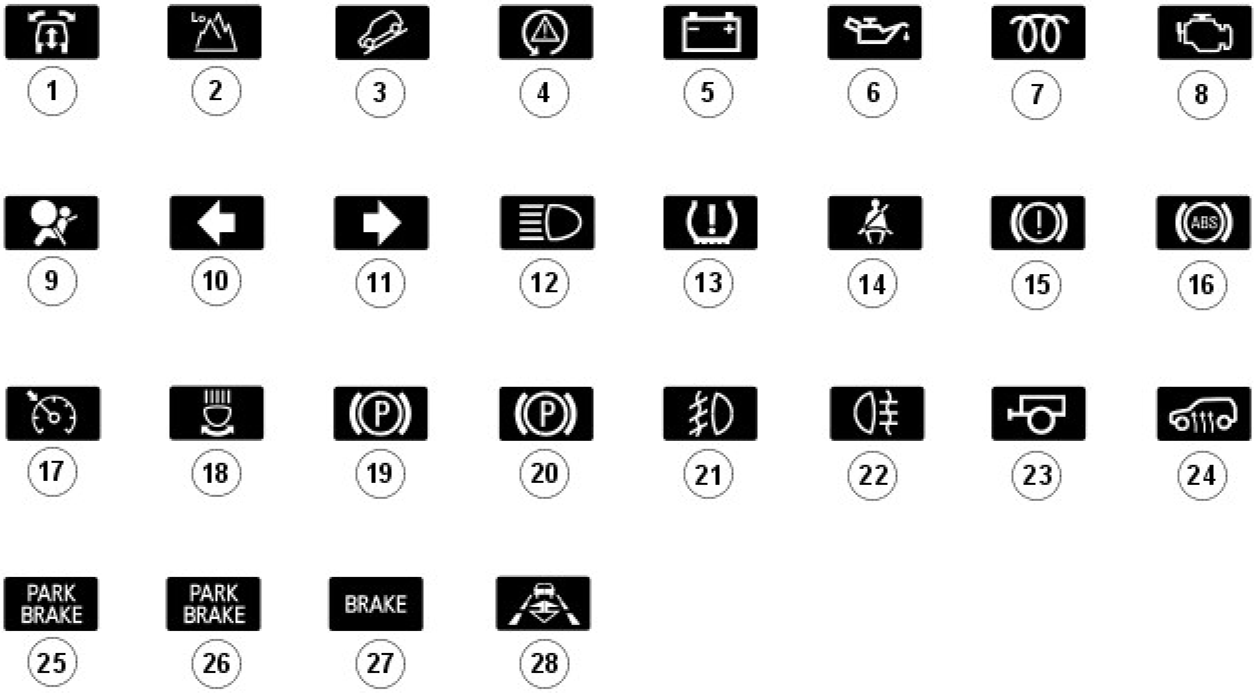
Some indicators are activated by an external subsystem module but the instrument cluster contains the control logic. These indicators are shown in the following table as being both self and externally controlled.

The following table shows the available indicators and indicates if they are subject to an indicator check at ignition on and if they are self or externally controlled.

Indicator	**Illumination Color**	**Bulb Check**	**Self Controlled (S) /Externally Controlled (E)**
Ignition/No charge	Red	No	E
Low oil pressure	Red	No	E
Glow plug active	Amber	* No (will illuminate at ignition on to show glow plugs active)	E
MIL	Amber	* Yes	E
Seat belt	Red	No	E
SRS	Red	* Yes	E
Adaptive speed control (if fitted)	Amber	No	E
Transfer box low range	Green	No	E
Air suspension/Dynamic Response	Amber / Red	Yes	E
HDC active	Green	No	E
DSC / Traction control	Amber	Yes	E
Left turn signal	Green	No	E
Right turn signal	Green	No	E
Trailer	Green	No	E
High engine coolant temperature	RED	Yes	S
High beam	Blue	No	E
ABS failure	Amber	* Yes	E

Indicator	Illumination Color	Bulb Check	Self Controlled (S) / Externally Controlled (E)
Low fuel level	Amber	Yes	S
Speed control	Amber	No	E
Park Brake City mode	Non-functional	-	-
Park brake fault	Amber	Yes	E
Park brake warning	Red	No	E
Front fog lamps	Green	No	E
Rear fog lamps	Amber	No	E
Alarm	Red	No	E
Driveline fault	Amber / Red	Yes	E
Auxiliary heater active - Non-functional bulb check only	Red	Yes	E
Tyre pressure monitoring	Amber	Yes	E
Brake warning	Amber / Red	Yes	E
Adaptive front lighting	Amber	Yes	E
*** = Bulb check performed by subsystem module, not instrument cluster**			

Warning Indicator Functionality



E57122

Item	Part Number	Description
1	-	Air suspension
2	-	Transfer box low range
3	-	HDC active
4	-	DSC/Traction control
5	-	Ignition/No charge
6	-	Low oil pressure
7	-	Glow plugs active (diesel models only)
8	-	Malfunction Indicator Lamp (petrol models only)
9	-	SRS warning
10	-	Left turn indicator
11	-	Right turn indicator
12	-	High beam
13	-	Tyre pressure monitoring system

14	-	Seat belt warning
15	-	Brake warning
16	-	ABS
17	-	Cruise control
18	-	Adaptive front lighting system
19	-	Park brake fault (all except NAS)
20	-	Park brake warning (all except NAS)
21	-	Front fog lamps
22	-	Rear fog lamps
23	-	Trailer
24	-	Auxiliary heating - Non-functional bulb check only
25	-	Park brake fault (NAS only)
26	-	Park brake warning (NAS only)
27	-	Brake warning (NAS only)
28	-	Adaptive Speed Control (if fitted)

The functionality for each of the above warning indicators is described below. Some warning indicators are accompanied by a chime from the instrument pack when they are illuminated and a message in the message center.

1. Air Suspension Indicator

The air suspension indicator is illuminated by the instrument cluster software on receipt of a CAN signal from the air suspension control module. The air suspension control module outputs a number of different signals relating to the air suspension system operation. The instrument cluster interprets the signals and can illuminate the indicator in either an amber or red colour as appropriate. Some signals also include requests for chimes from the instrument cluster to alert the driver.

2. Transfer Box Low Range Indicator

The transfer box low range indicator is illuminated by the instrument cluster software on receipt of CAN signals from the transfer box control module. When a range change from high to low range is in progress, the low range indicator flashes in an green color. When the range change is complete, the low range indicator remains permanently illuminated until high range is selected.

The transfer box control module also requests a single chime from the instrument cluster to alert the driver that the requested range change is complete. On high line instrument clusters, the range change information is also displayed in the message center.

3. Hill Descent Control (HDC) Active Indicator

The HDC active indicator is illuminated by the instrument cluster software on receipt of CAN signals from the ABS module. The indicator is illuminated in a green color when HDC is active and the vehicle speed is below a predetermined threshold. If the vehicle speed is faster than the threshold limit, the HDC indicator will flash until the vehicle speed is reduced. On high line instrument clusters a supporting message will also be displayed in the message center.
For additional information, refer to: Anti-Lock Control - Traction Control (206-09A Anti-Lock Control - Traction Control, Description and Operation).

If the use of HDC causes the brake discs to exceed their pre-determined temperature, the HDC system initiates a 'fade out'. The HDC indicator flashes during 'fade out' and on high line instrument clusters a supporting message is displayed in the message center. When the brake discs have cooled sufficiently, HDC is reactivated and the HDC indicator is permanently illuminated.

4. Dynamic Stability Control (DSC)/Traction Control Indicator

The DSC/traction control indicator is illuminated by the instrument cluster software on receipt of CAN signals from the ABS module. The indicator is illuminated in an amber color for 3 seconds for a bulb check when the ignition is switched on. If no faults exist, the indicator is extinguished after the bulb check period.

When DSC is active, the indicator flashes to inform the driver that the system is regulating engine output and braking forces. If the indicator remains illuminated after the bulb check period or illuminates when driving, the DSC system has a fault or DSC has been deselected by the driver using the DSC switch on the fascia.

5. Ignition/No Charge Indicator

The ignition/no charge indicator is controlled by the instrument cluster software and illuminated by CAN signals from the Engine Control Module (ECM). The indicator illuminates in a red color when the ignition is moved to position II and is extinguished when the engine is started.

If the indicator remains illuminated after the engine has started or illuminates when driving, the alternator charge output has failed.

6. Low Oil Pressure Indicator

The low oil pressure indicator is hardwired directly to the instrument cluster. The indicator is illuminated in a red color when the ignition is moved to position II. When the engine is started and the oil pressure increases the low oil pressure indicator should extinguish. If the indicator remains illuminated or illuminates when driving the vehicle should be stopped at the earliest opportunity and the engine switched off until the fault is rectified.

7. Glow Plugs Active Indicator (Diesel models only)

The glow plugs active indicator is illuminated by the instrument cluster software on receipt of a CAN message from the Engine Control Module (ECM). The indicator is located in the same position as the MIL on petrol models. The indicator illuminates in an amber color when the ignition is moved to position II. The indicator illumination period varies with engine temperature and is some cases will not illuminate when the engine temperature is high. The indicator is controlled by CAN signals from the ECM which equate to the time which the glow plugs are energised to pre-heat the combustion chambers.
For additional information, refer to: Glow Plug System (303-07C Glow Plug System - TDV6 2.7L Diesel, Description and Operation).
When the glow plug heating time is complete, the indicator is extinguished indicating to the driver that the engine can now be started.

8. Malfunction Indicator Lamp (MIL)

The MIL is controlled by the instrument cluster software on receipt of CAN signals from the ECM. The indicator is illuminated for a bulb check by the ECM when the ignition is moved to position II. The lamp is extinguished when the engine starts.

If the MIL remains illuminated after the engine is started or illuminates while driving, a fault is present and must investigated at the earliest opportunity. Illumination of the MIL indicates that there is an On-Board Diagnostic (OBD) fault which will cause excessive emissions output. This may relate to either an engine management system fault or a transmission fault.

9. Supplementary Restraint System (SRS) Warning Indicator

The SRS warning indicator is controlled by the restraints control module which transmits CAN signals to the instrument cluster. The warning indicator is illuminated for 6 seconds for a bulb check by the restraints control module when the ignition is moved to position II. If a fault is detected in the SRS the restraints control module illuminates the warning indicator in a red color until the fault is rectified.

The instrument cluster also performs a check of the indicator LED functionality. Failure of the indicator LED is transmitted to the driver in the form of a '5R5' (SRS) message which is displayed in the trip meter display.

10 and 11. Left and Right Turn Indicators

The turn indicators are controlled by the instrument cluster software on receipt of CAN signals on the medium speed CAN bus from the Central Junction Box (CJB). When the turn signal indicator switch is operated, the CJB transmits a signal to the instrument cluster to operate the applicable turn indicator. The instrument cluster software controls the flash rate of the indicator which flashes in a green color. During normal turn signal indicator operation the indicator flashes slowly, accompanied simultaneously by a sound from the instrument cluster sounder. If a fault exists, the instrument cluster responds to a fault message from the CJB and flashes the indicator at double speed.

The hazard warning indicators are also controlled by the CJB and the instrument cluster software and operate in the same manner as the turn signal indicators. The hazard warning indicators can operate with the ignition switched off, therefore, the CAN signal from the CJB to the instrument cluster to operate the left and right hand turn signal indicators will also 'wake-up' the instrument cluster.

12. High Beam Indicator

The high beam indicator is controlled by the instrument cluster software on receipt of CAN signals on the medium speed CAN bus from the Central Junction Box (CJB). When the high beam switch is moved to the high beam or headlight flash position, the CJB transmits a CAN message to the instrument cluster to illuminate the high beam indicator in a blue color.

13. Tyre Pressure Monitoring System (TPMS) Indicator

The Tyre Pressure Monitoring System (TPMS) indicator is controlled by the instrument cluster software on receipt of CAN signals from the TPMS module. The indicator is illuminated in an amber color for a 3 second bulb check by the TPMS module when the ignition is moved to position II. If the indicator remains illuminated after the engine is started or illuminates when driving, the TPMS has developed a fault. The tyre pressures should be monitored manually until the fault is rectified.

14. Safety Belt Warning Indicator

The safety belt warning indicator is controlled by the restraints control module and the instrument cluster software on receipt of CAN signals from the restraints control module.

The indicator is illuminated in a red color when the ignition is moved to position II. The illumination will remain on until the safety belt buckle is latched in position. If the safety belt of an occupied front seat is not fastened, when the vehicle speed exceeds 8 km/h (5 mph) the indicator will flash and repetitive chime will emit for 10 seconds from the instrument cluster. This will be repeated every 30 seconds until the safety belt is fastened, the vehicle speed is reduced below 5 km/h (3 mph) or the ignition switch is moved to the off position.

On NAS vehicles, the indicator will remain permanently illuminated until the safety belt is fastened, the vehicle speed is reduced below 5 km/h (3 mph) or the ignition switch is moved to the off position.

15 and 27. Brake Warning Indicator

This indicator is controlled by CAN signals from the ABS module for Electronic Brake Assist (EBA) and Electronic Brake Distribution (EBD) faults. Brake pad wear or low brake fluid indications are controlled by the instrument cluster with the pad wear sensors and the fluid level sensor hard wired into the instrument cluster.

The indicator can be illuminated in an amber or red colour depending on the fault. The indicator is illuminated for a bulb check when the ignition is switched on. The indicator is illuminated in an amber colour for 1.5 seconds and red colour for a further 1.5 seconds. If no faults exist, the indicator is extinguished after the bulb check period.

The brake warning indicator functions are assigned priority. Fault conditions which require a red illumination have priority over amber illuminated faults.

Brake Pad Wear

- The front left hand inboard brake pad and the rear right hand inboard brake pad are fitted with wear sensors. The pads are wired in series to the instrument cluster which continuously monitors the circuit. When one or both pads wear to their allowed limit (approximately 75% worn) the sensor circuit is broken and is detected by the instrument cluster software. The instrument cluster illuminates the brake warning indicator in a red colour and a message 'CHECK BRAKE PADS' is displayed in the message center. When the pad(s) are replaced, the instrument cluster senses the completed circuit and withdraws the indicator illumination and message display when the ignition is switched on to position II.

EBA/EBD Warning

- If a failure of the EBA or EBD functions occur, the ABS module transmits a CAN signal which is received by the instrument cluster. The instrument cluster software illuminates the brake warning indicator in an amber color for minor EBA/EBD faults and in a red color for major EBA/EBD faults. The indicator will remain illuminated for as long as the fault exists.

Low Brake Fluid

- The brake fluid reservoir is fitted with a sensor which is connected directly to the instrument cluster. When the ignition is switched on to position II the fluid level is checked. To prevent incorrect warnings when the vehicle is moving, the sensor is monitored once every 25 seconds. If a low fluid situation occurs, the instrument cluster illuminates the brake warning indicator in a red color and on high line instrument clusters also displays the message 'CHECK BRAKE FLUID' in the message center. Illumination of the indicator for low fluid level is also accompanied by a chime from the instrument cluster.

16. Anti-lock Brake System (ABS) Indicator

The ABS indicator is controlled by the ABS module which transmits a CAN signal to the instrument cluster. The indicator is illuminated in an amber color for 3 seconds for a bulb check by the ABS module when the ignition is moved to position II. If the indicator remains illuminated or illuminates when driving, an ABS fault has occurred an the ABS function will not be available.

During the bulb check, if the indicator comes on for 0.5 second, then goes off for 0.5 second and is then illuminated for the remaining 2 seconds of the bulb check, this indicates that faults are stored in the ABS module memory.

If the indicator was illuminated due to a sensor fault, the indicator will remain illuminated at the next ignition cycle, even if the fault is rectified. When the vehicle is driven above a speed of 20 km/h (12.5 mph) the indicator will be extinguished. This allows the ABS module to perform a thorough check of the system and to establish that the output from the replaced sensor is correct.

17. Cruise Control Indicator

The cruise control indicator is controlled by the ECM and the instrument cluster on receipt of CAN signals from the ECM. When the cruise control is selected on, the indicator is illuminated providing that cruise has been resumed and is not within 8 km/h (5 mph) of the set speed or cruise is on and the vehicle speed is within 8 km/h (5 mph).

18. Adaptive Front Lighting System (AFS) Indicator

The AFS indicator is controlled by the AFS control module and the instrument cluster software on receipt of CAN signals from the control module. The indicator is illuminated in an amber color for a 3 second bulb check when the ignition is moved to position II.

The AFS indicator displays AFS system failures to the driver. If a failure occurs, the indicator will flash continuously until the fault is rectified.

19 and 25. Park Brake Fault Indicator

The park brake fault indicator is controlled by the instrument cluster software on receipt of CAN signals from the Electronic Park Brake (EPB) control module. The indicator is illuminated in an amber color for 3 second for a bulb check when the ignition is moved to position II. If a fault occurs in the EPB system occurs, the EPB control module requests illumination of the indicator which remains illuminated until the fault is rectified.

20 and 26. Park Brake Warning Indicator

The park brake warning indicator is controlled by the instrument cluster software on receipt of CAN signals from the Electronic Park Brake (EPB) control module. The indicator is illuminated in a red color when the park brake is applied. If the ignition is moved to the off position, the indicator remains illuminated for 3 minutes. If a fault occurs which prevents park brake application the indicator flashes and the park brake fault indicator is also illuminated.

21. Front Fog Lamps Indicator

The front fog lamp indicator is controlled by the CJB which illuminates the indicator via a hardwired connection to the instrument cluster. The lamp is illuminated in a green color at all times when the front fog lamps are selected on and the ignition is in position II.

22. Rear Fog Lamps Indicator

The rear fog lamp indicator is controlled by the CJB which illuminates the indicator via a hardwired connection to the instrument cluster. The lamp is illuminated in an amber color at all times when the rear fog lamps are selected on and the ignition is in position II.

23. Trailer Indicator

The trailer indicator is controlled by the instrument cluster software on receipt of CAN signals on the medium speed CAN bus from the Central Junction Box (CJB). When a trailer is connected to the vehicle electrical system and the turn signal indicator switch is operated, the CJB transmits a signal to the instrument cluster to operate the trailer indicator. The instrument cluster software controls the flash rate of the indicator which flashes in a green color. The trailer indicator flashes slowly, accompanied simultaneously by a sound from the instrument cluster sounder, at the same rate as the turn signal indicators.

24. Auxiliary Heating Indicator

The auxiliary heating indicator is illuminated in an amber color for a 3 seconds bulb check when the ignition is moved to position II. The indicator is for later fitment of the auxiliary heating system and therefore is only illuminated for the bulb check.

28. Adaptive Speed Control Indicator (if fitted)

The adaptive speed control indicator is controlled by the adaptive speed control module and the instrument cluster software. The indicator is illuminated when cruise control is active and another vehicle is detected by the radar system in front of the vehicle. The indicator is illuminated in an amber color to alert the driver that the adaptive speed control system is active and will automatically control the vehicle speed to maintain a set distance from the vehicle in front.

ANALOGUE INSTRUMENTS

The analogue instruments located in the instrument cluster are as follows:

- Speedometer
- Tachometer
- Fuel level gage
- Engine coolant temperature gage.

The speedometer, tachometer, fuel gauge and engine temperature gauge are each driven by an electronic stepper motor. The characteristics of this type of motor produce damping of the pointer needle. All of the gages return to their respective zero positions when the ignition is switched off.

Speedometer

The speedometer is driven by square wave signals derived from the wheel speed sensors and the ABS module. The wheel speeds are measured by the wheel speed sensors reading the rotational speed of the wheels from toothed targets on the hubs. The wheel speeds are passed from the sensors to the ABS module in the form of pulsed signals. The ABS module converts these signals into a speed output on the high speed CAN to the instrument cluster.

Three versions of the speedometer display are used. The three versions show the speed in kilometres per hour, the speed in miles per hour as the main display and kilometres per hour as a secondary display and Canadian variants show the kilometres per hour as the main display and miles per hours as the secondary display.

Tachometer

The tachometer is driven by an engine speed signal transmitted on the high speed CAN from the ECM. The signal is derived from the Crankshaft Position (CKP) sensor. The signal is received by the instrument cluster microprocessor and the output from the microprocessor drives the tachometer.

Two versions of the tachometer are used for petrol and diesel engine variants. The petrol engine variants use a display which has a maximum engine speed reading of 8000 rev/min. The diesel engine variants use a display which has a maximum engine speed reading of 6000 rev/min.

Fuel Level Gage

The fuel level gage displays the fuel tank contents. When the ignition is off, the pointer returns to the empty position.

The instrument pack is connected to two tank level sensors. One sensor is located at the front of the fuel tank and the other is located at the rear. Each sensor uses a float operated MAgnetic Passive Position Sensor (MAPPS) for measuring the fuel tank contents. For additional information, refer to:

> Fuel Tank and Lines (310-01A Fuel Tank and Lines - V8 S/C 4.2L Petrol, Description and Operation),
> Fuel Tank and Lines (310-01B Fuel Tank and Lines - V8 4.4L Petrol, Description and Operation).

Each sensor is supplied with a reference current from the instrument cluster. The instrument cluster measures the returned output from each sensor which is proportional to the amount of fuel in the tank and the position of the float arm. The inclination of the vehicle, derived from a CAN message from the Electronic Park Brake (EPB) module, is also used to calculate the fuel tank contents. The instrument cluster uses the fuel level sensor signals and the EPB module inclination signals to accurately calculate the volume of fuel in the tank and display this on the fuel level gage. The instrument cluster monitors the signals and updates the fuel level gage pointer position at approximately 20 second intervals. This prevents the pointer moving continually due to fuel movement in the tank due to cornering or braking. When the ignition is off, the pointer needle returns to the empty position.

A warning lamp is incorporated into the fuel level gage and illuminates when the fuel tank volume is at or below 12.5 liters (2.75 Gallons) on petrol models and 14 liters (3.69 Gallons) on diesel models. This is accompanied by a chime from the instrument cluster and a message alert the driver to the low fuel condition.

The fuel tank content is converted into a CAN signal by the instrument cluster and transmitted on the CAN. This is received by Fuel Fired Booster Heater (FFBH) control module (if fitted) to suspend operation of the FFBH on diesel variants when the fuel tank content reaches 14 liters or less.

The following table shows the fuel tank fuel quantity and the respective pointer positions.

Fuel Tank Quantity (Liters)	Needle Pointer Position
4.91	Empty
12.5	Low fuel (low fuel lamp illuminated - Petrol engines)
14	Low fuel (low fuel lamp illuminated - Diesel engine)
25.6	Quarter full
45.8	Half full
67	Three quarter full
81.05	Full

Engine Coolant Temperature Gage

The engine coolant temperature gage displays the engine coolant temperature to the driver. When the ignition is off the pointer needle returns to the cold position.

The engine coolant temperature sensor is connected to the ECM which monitors the sensor signals and converts the signals into a value for the engine coolant temperature. This information is transmitted on the high speed CAN for use by the instrument cluster and other systems. For additional information, refer to:

> Electronic Engine Controls (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, Description and Operation),
> Electronic Engine Controls (303-14B Electronic Engine Controls - V8 4.4L Petrol, Description and Operation),
> Electronic Engine Controls (303-14C Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

The engine coolant temperature gage is the same on all pack variants. The gage has a blue segment for low temperatures and a red segment for excessively high temperatures. For normal operating temperatures the gage needle pointer is positioned centrally in the gage display zone. The needle pointer position translates to the following approximate temperatures.

Engine Coolant Temperature °C (°F)	Needle Pointer Position
Ignition off	Park position
40 (104)	Cold (Blue segment)
75 - 115 (167 - 239)	Normal
120 (248)	Start of hot (Red segment)
125 (257)	End of hot

AMBIENT LIGHT SENSOR

An ambient light sensor is located in the instrument cluster, adjacent to the alarm indicator. The ambient light sensor is a phototransistor which measures the available ambient light.

The phototransistor measures the ambient light (lux) level and passes a signal value for the available light level to the instrument cluster microprocessor. The instrument cluster software adjusts the display brightness of the message center and information display LCD's accordingly to ensure that the displays are clearly visible during day and night time driving.

MESSAGE CENTER

Refer to Information and Message Center section for details.
For additional information, refer to: Information and Message Center (413-08 Information and Message Center, Description and Operation).

INPUTS AND OUTPUTS

A single electrical harness connector provides all inputs and outputs to and from the instrument cluster.

Instrument cluster Harness Connector C0230

DIAGNOSTICS

Car Configuration File

The Car Configuration File (CCF) contains all relevant data about the specification and market condition of the applicable vehicle, immobilisation codes and driver personal settings. This information is retained in the Central Junction Box (CJB), the Engine Control Module (ECM) and the instrument cluster enabling each system module to detect which systems and components are fitted to the vehicle. The information is continuously transferred between the three system modules to ensure that the data is constantly backed-up between the modules.

⚠ CAUTION: When a new instrument cluster is to be installed, an approved Land Rover diagnostic system must be connected to the vehicle and the instrument cluster renewal procedure followed to replace the cluster. This will ensure that vehicle coding data is correctly installed in the new instrument cluster. An approved Land Rover diagnostic system will also record the current service interval data and restore the settings in the new instrument cluster.

When a new instrument cluster is installed, an approved Land Rover diagnostic system is used to transfer the CCF data from the CJB to the replacement cluster. Vehicle coding data such as engine type, market etc is retrieved and used to update the replacement instrument cluster.

The CCF will also need to be updated using an approved Land Rover diagnostic system if the vehicle is modified in service from its original factory specification. This can include fitting non-standard wheels and/or tyres, optional accessory dealer fit components with an electrical interface, i.e. park distance control.

CUSTOMER PERSONALISATION

Refer to Information and Message Center section for details.
For additional information, refer to: Information and Message Center (413-08 Information and Message Center, Description and Operation).

Instrument Cluster - Instrument Cluster

Diagnosis and Testing

Overview

Data is provided to the instrument cluster from other subsystem modules in the form of controller area network (CAN) messages. The instrument cluster identifies the signals and displays the appropriate message in the message center. Most messages are accompanied by a chime or series of chimes which are requested by the module generating the message. The driver can view system status messages which are current within the instrument cluster software by pressing and holding the trip reset button for more than three seconds, the information display will then display the current messages in priority order. For more information, refer to the relevant workshop manual section.

Car configuration file (CCF)

⚠ CAUTION: If a new instrument cluster is to be installed, the instrument cluster renewal procedure must be carried out using the approved diagnostic system. This will ensure that the CCF data is correctly transferred from the central junction box (CJB) to the replacement cluster. The CCF will also need to be updated using the approved diagnostic system if the vehicle is modified in service from its original factory specification. This can include the fitting of non-standard wheels and/or tires and optional accessory dealer install components with an electrical interface, such as park distance control.

The CCF contains all relevant data about the specification and market condition of the applicable vehicle, immobilization codes and driver personal settings. This information is retained in the CJB, the engine control module (ECM) and the instrument cluster enabling each system module to detect which systems and components are installed to the vehicle. The information is continuously transferred between these three system modules to ensure that the data is constantly backed-up between the modules.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Confirm which, if any, warning lights and/or messages were displayed on the instrument cluster. For a list of messages, refer to workshop manual section 413-08 - Information and Message Center.
3. **3.** Visually inspect for obvious electrical faults.

Visual inspection

Electrical
• Battery • Fuses - Central and battery junction boxes - Megafuses • Wiring harness • Damaged, loose or corroded connectors • Controller area network (CAN) circuits • Instrument cluster • Central junction box (CJB) • Engine control module (ECM)

4. **4.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
5. **5.** Use the approved diagnostic system or a scan tool to retrieve any DTCs before moving onto the DTC index.
    - Make sure that all DTCs are cleared following rectification.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible cause(s)	Action
B1A0016	Control Module	• Battery voltage low • Battery ground cable high resistance • Battery connections loose/corroded • Battery current drain	Check the battery condition and state of charge. Refer to the relevant section of the workshop manual. Check the module power and ground circuits. Refer to the electrical guides.

Removal and Installation

Removal

1. Fully extend the steering column for access.
2. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
3. Remove the steering wheel.
   For additional information, refer to: Steering Wheel (211-04 Steering Column, Removal and Installation).
4. Remove the headlamp switch trim panel.
   For additional information, refer to: Headlamp Switch (417-01 Exterior Lighting, Removal and Installation).
5. Remove the instrument panel access panel.

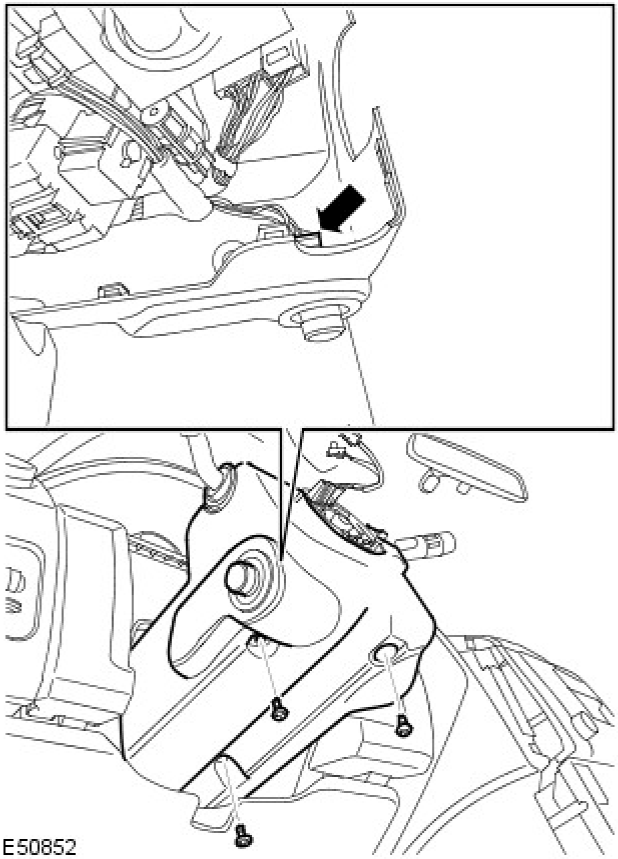
   - Release the 2 clips.

6. Remove the steering column upper shroud.

   - Release the 6 clips.

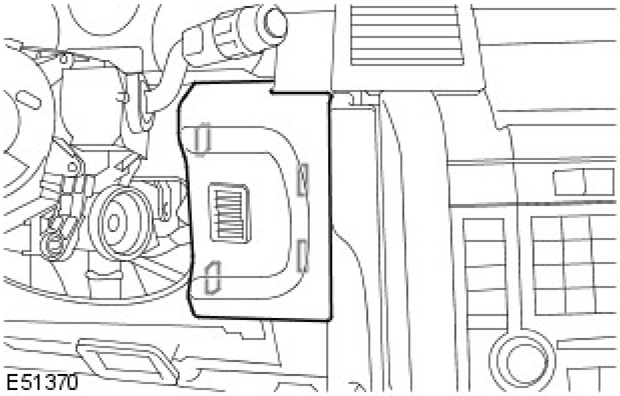
7. Remove the steering column lower shroud.

- Remove the 3 Torx screws.
- Disconnect the electrical connector.

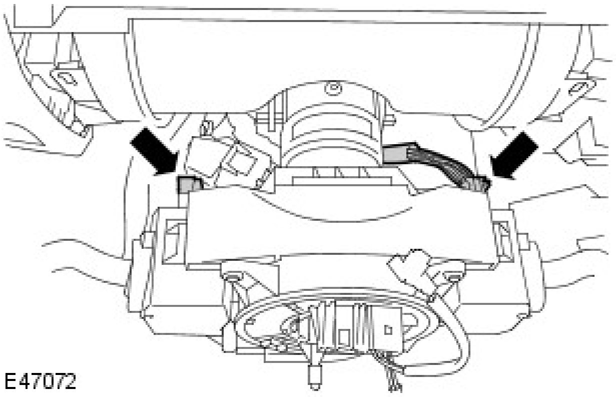


8. Remove the steering column side trim panel.

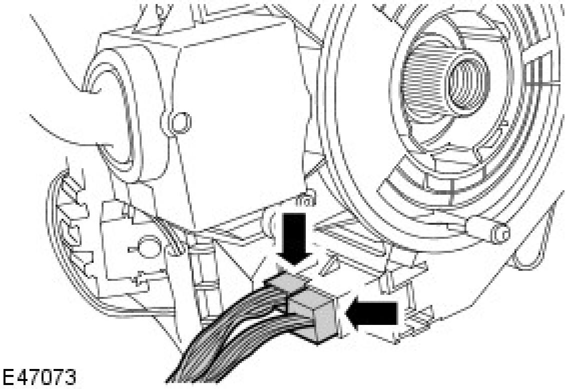
- Release the 4 clips.



9. Disconnect the 2 electrical connectors from the steering column multifunction switches.

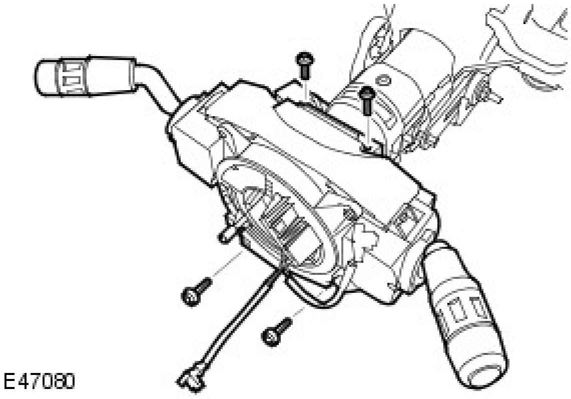


10. Disconnect the 2 electrical connectors from the clockspring.



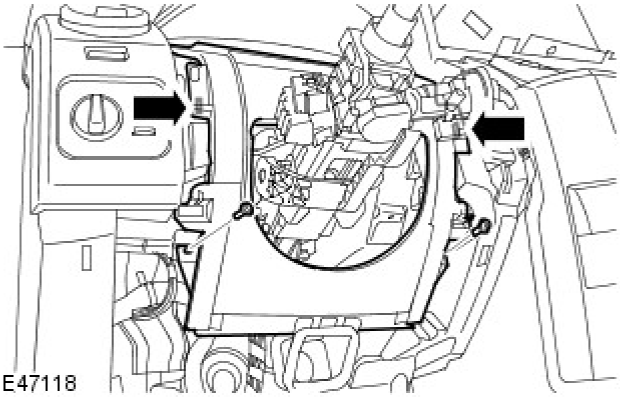
11. Remove the steering column switch assembly.

- Remove the 4 Torx bolts.



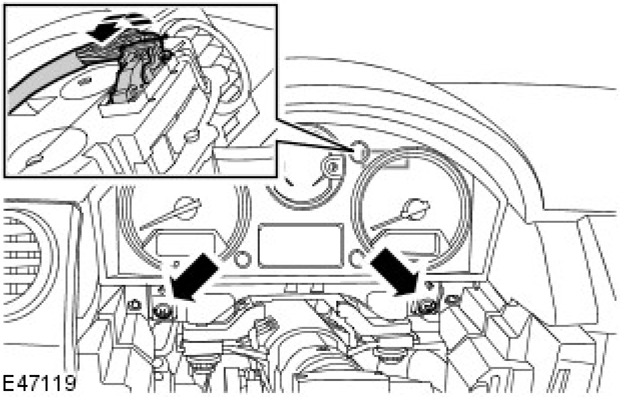
12. Remove the steering column gaiter panel.

- Remove the 2 Torx screws.
- Release the 2 clips.



13. Remove the instrument cluster.

- Remove the 2 Torx screws.
- Disconnect the electrical connector.

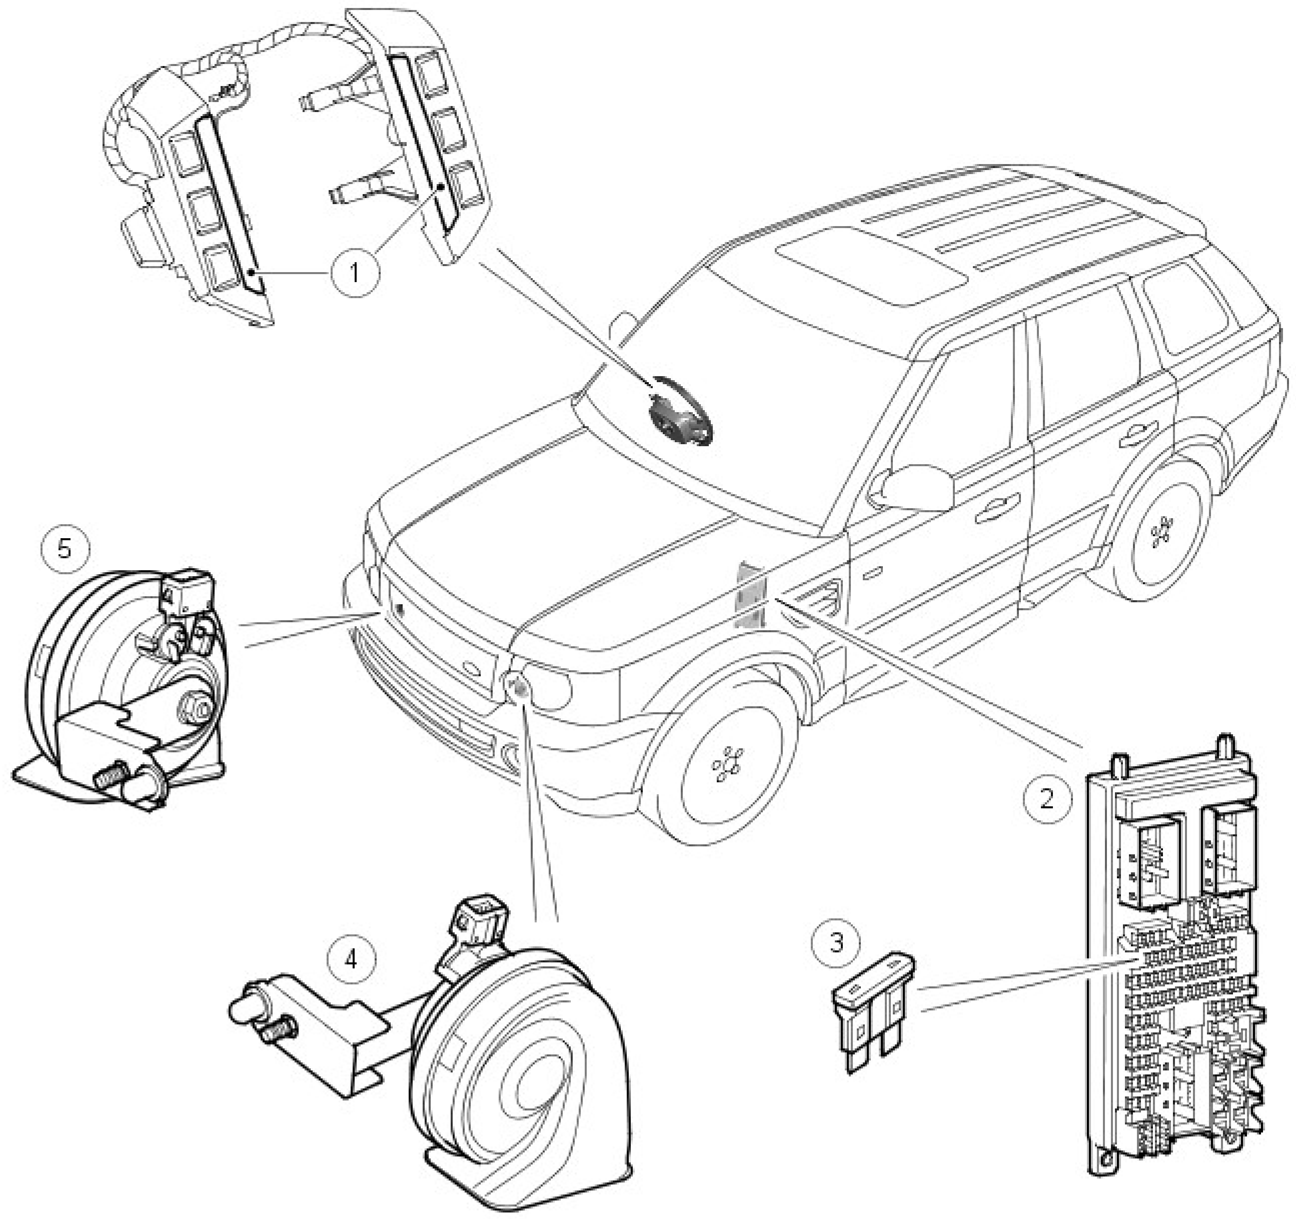


Installation

1. Install the instrument cluster.
    - Connect the electrical connector.
    - Tighten the Torx screws.
2. Install the steering column gaiter panel.
    - Secure with the clips.
    - Tighten the Torx screws.
3. Install the steering column switch assembly.
    - Tighten the Torx bolts to 3 Nm (2 lb.ft).
4. Connect the clockspring and multifunction switch electrical connectors.
5. Install the steering column side trim panel.
    - Secure with the clips.
6. Install the steering column shrouds.
    - Connect the electrical connector.
    - Tighten the Torx screws.
    - Secure the clips.
7. Install the instrument panel access panel.
    - Secure with the clips.
8. Install the headlamp switch trim panel.
   For additional information, refer to: Headlamp Switch (417-01 Exterior Lighting, Removal and Installation).
9. Install the steering wheel.
   For additional information, refer to: Steering Wheel (211-04 Steering Column, Removal and Installation).
10. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Horn - Horn

Description and Operation



E57351

Item	Part Number	Description
1	-	Steering wheel horn switches
2	-	Central Junction Box (CJB)
3	-	Fuse 12
4	-	Horn - Low tone
5	-	Horn - High tone

GENERAL

Two horns are fitted to the vehicle; a high tone and a low tone. The horns are mounted on brackets, which are attached to the front end carrier assembly, on each side of the radiator.

The horns are operated by pressing one of the two horn switches, located on each side of the driver airbag, on the steering wheel.

The horns are also used by the vehicle alarm system. When the alarm system requires the horns to operate, the Central Junction Box (CJB) provides a ground to the horn relay solenoid, closing the relay contact which in turn supplies battery voltage to operate the horns.
For additional information, refer to: Anti-Theft - Active (419-01A Anti-Theft - Active, Description and Operation).

The horn circuit is permanently connected to battery voltage and therefore the horns can be operated at any time, irrespective of ignition switch position.

The horns are controlled by a relay which is an integral part of the CJB. The relay contact and solenoid is connected to the vehicle battery via a fusible link (Link 17E) in the battery junction box and a fuse (F12P) in the CJB. The horn switches, when pressed, complete a ground to the relay which energises the solenoid. The energised solenoid closes the relay contact and battery voltage is supplied to each of the horns. When the horn switch is released, the ground for the solenoid is broken, the solenoid is de-energised and the relay contact opens, cutting the voltage supply to the horns.

4	-	Odometer display
5	-	Miles or KM display
6	-	Trip meter display
7	-	LCD Information display
8	-	Gear position display
9	-	Transmission mode display
10	-	Selected gear position display

The instrument cluster is an electronic device which receives digital or analog signals via hardwired or bus systems for instrumentation operation.

OVERVIEW

Two variants of the instrument cluster are used; high line and low line. Both variants also differ depending on market specification, engine fitments and features fitted to the vehicle.
For additional information, refer to: Instrument Cluster (413-01 Instrument Cluster, Description and Operation).

The instrument cluster is an electronic device which receives digital or analog signals via hardwired or bus systems for instrumentation operation.

The information display, which shows odometer, trip, gear position and mode data, is applicable to both high and low line instrument clusters. The message centre is only available on high line instrument clusters.

MESSAGE CENTRE

The message centre is an Liquid Crystal Display (LCD) located in a central position at the bottom of the instrument cluster. The LCD has a viewable area of 71 mm X 36 mm with a pixel size of 0.54 mm X 0.54 mm. When active, the message centre is illuminated as follows:

- At ignition on
- At ignition off when all current messages are being displayed to the driver
- At ignition off for a period of 20 seconds after the last message is displayed, e.g. 'KEY IN' or 'LIGHTS ON' warnings. At ignition off, each current message is displayed in turn for 3 seconds

When the ignition is switched on and the lights are off, the message centre will illuminate at full, normal brightness. If the lights are switched on, the intensity of illumination is reduced to a level determined by the PWM dimmer control located on the lighting control switch.

The majority of messages are generated by the vehicle subsystem modules on receipt of CAN bus message signals. The instrument cluster identifies the signals and displays the appropriate message in the message centre.

Most messages are accompanied by a chime or series of chimes which is requested by the module generating the message. The chime is emitted by a sounder located within the instrument cluster.

The driver can view current system status messages by scrolling through the trip computer functions to replay mode. This is achieved by pressing the **'I'** button on the LH column multifunction switch until the messages are displayed. If messages are current an **'I'** is displayed in the message centre.

Message Centre Display Arbitration

When the ignition is switched on, the message centre displays the system check message for 3 seconds. If the ignition is switched off during this period, the display goes off.

After the system check, the message centre shows the normal display (display mode 3E, see following section for mode descriptions). The display shows the ambient temperature, adaptive cruise information (if applicable) and trip computer information. This display format is changed if the driver switches the ignition off or the instrument cluster detects a condition which needs to be relayed to the driver, low washer fluid for example. Driver intervention has the highest priority. If a driver request and a warning condition become active at the same time, the driver request will be displayed first.

If an adaptive cruise set-up message is received, the display will change to display mode 3 D or E (see following section for mode descriptions). This will display for 3 seconds when the display changes back to the normal display.

If a Terrain Response™ message is received, the display will change to a mode 3 display, appropriate for the additional information to be displayed. The instrument cluster reviews the information required to be displayed and shows the appropriate format.

Display Modes

The message centre has five different display modes. Each mode is displayed depending on vehicle operating conditions and driver requests. The display modes are detailed in the following table:

Display Mode	Description	Format
0	Blank	No display in this mode
1	Information	Customer settings display
2	Pre-check	System precheck at ignition on
3	Normal	Seven different formats available (A, B, C, D, E, F or G) depending on vehicle specification and active functions
4	Diagnostic	Test images displayed to check LCD function

Display Mode 0

This mode is entered when the ignition is off and the CAN bus system is 'asleep' and no characters or symbols are displayed. This mode is exited by switching the ignition on or if the driver selects the 'Customer Settings' mode.

Display Mode 1

This mode displays information to the driver and provides the driver with the option to change certain settings for the vehicle. The display is a full screen format. A number of displays are available to allow the driver to customise various vehicle functions. Refer to 'Customer Settings' in this section for further details.

Display Mode 2 - System Start-up

When the ignition is switched on, the LCD shows the 'SYSTEM CHECK IN PROGRESS' message. This message is displayed during the indicator lamp test period for 3 seconds after the ignition on is sensed. When the ignition is switched off, the LCD returns to the display mode 0.

Display Mode 3

Display mode 3 is the normal operating mode for the message centre. There are seven different display formats (A to G) which cover all possible display formats. The seven displays are described below:

- **A** = Display shows: Terrain Response™ Mode icon; Steering Wheel Direction Icons; Trip computer/Warning Messages
- **B** = Display shows: Terrain Response™ Modes (Active mode in reverse image); Terrain Response™ description message
- **C** = Display shows: Active Terrain Response™ Mode icon; Terrain Response ™ Description message; Trip Computer/Warning Messages
- **D** = Display shows: Active Terrain Response™ Mode icon; Ambient Temperature; Text/Information/Advice/Warnings; Adaptive Cruise Control (if applicable)
- **E** = Display shows: Ambient Temperature; Adaptive Cruise Control (if applicable); Text/Information/Advice/Warnings
- **F** = Display shows: Ambient Temperature; Warnings/Information
- **G** = Display shows: Active Terrain Response™ Mode icon; Ambient Temperature; Text/Information/Advice/Warnings

Display Mode 4

Display mode 4 is a diagnostic mode used to check for the correct function of the LCD. The mode is entered using an approved Land Rover diagnostic system and displays four differing patterns in the LCD to check that all areas of the LCD are functional.

Message Priority

The messages are assigned priorities which are defined by the effect on driving safety and functional ability of the vehicle. New messages are displayed and accompanied by a chime from the sounder. Messages are divided into three priority groups; 1, 2, and 3 as follows:

Priority Group 1

- This group of messages have a direct effect on the driving ability and safety of the vehicle, 'ENGINE SYSTEM FAULT' for example. This message would require an immediate reaction from the driver in response to the message. Priority 1 messages will also be accompanied by the appropriate warning indicator flashing and a continuous chime from the instrument cluster. If more than one priority 1 message is present, each message is displayed in turn at 3 second intervals.

Priority Group 2

- This group of messages do not directly affect the driving ability or safety of the vehicle, 'CHECK BRAKE PADS' for example. This message must be noted by the driver and the cause rectified as soon as possible. Each of these messages is displayed once at ignition on or when the fault occurs for a predetermined time period. These messages can be recalled by the driver by pressing the trip reset button for more than 3 seconds.

Priority Group 3

- This group of messages relate to low priority messages, 'WASHER FLUID LOW' for example. Depending on the message, some messages are only shown at the end of a journey to avoid annoyance to the driver. The messages will be accompanied by a chime when the ignition is switched off to alert the driver to their presence.

The messages are displayed in a language applicable to the market configuration of the vehicle and can be changed using an approved Land Rover diagnostic system. The following list shows the possible messages which can be displayed, other visual or audible warnings and a description of the message.

Message	Other Warnings	Reason	Action
SYSTEM CHECK IN PROGRESS	None	Instrument cluster internal diagnostic routine	None
SYSTEM FAULT SPECIAL PROGRAMS NOT AVAILABLE	Single chime, general program icon illuminated in message centre	Terrain Response special programs not available due to system fault. Drive off-road with care.	Connect an approved Land Rover diagnostic system to diagnose fault
RECOMMEND LOW RANGE IS SELECTED FOR MUD-RUTS PROGRAM	Mud-ruts program icon illuminated in message centre	Advisory message for Terrain Response special program displayed once every ignition cycle	Select low range if required
SPECIAL PROGRAMS OFF	General program icon illuminated in message centre	Advisory message to inform driver that system is in special programs off	None
RECOMMEND STARTING IN 2ND GEAR FOR SLIPPERY CONDITIONS	Grass Gravel Snow program icon illuminated in message centre	Advisory message for Terrain Response special program (Only displayed on vehicles with manual transmission in low range, once every ignition cycle)	Select 2nd gear if required

Message	Other Warnings	Reason	Action
RECOMMEND STARTING IN 3RD GEAR FOR SLIPPERY CONDITIONS	Grass Gravel Snow program icon illuminated in message centre	Advisory message for Terrain Response special program (Only displayed on vehicles with manual transmission in low range, once every ignition cycle)	Select 3rd gear if required
RECOMMEND RAISING SUSPENSION TO OFF ROAD HEIGHT IN DEEP MUD-RUTS	Mud-ruts program icon illuminated in message centre	Advisory message for Terrain Response mud/ruts special program when in high range, displayed once every ignition cycle (Suspension raised automatically when in low range)	Raise suspension manually to off-road height if required
Terrain Response SPECIAL PROGRAMS OFF	All five program icons illuminated in message centre	Advisory message to inform driver that Terrain Response special programs are off	None
SPECIAL PROGRAMS OFF	General program icon illuminated in message centre	Advisory message to inform driver that current special program has been switched off and general program is active	None
CAUTION! RISK OF GROUNDING WITH SUSPENSION AT NORMAL HEIGHT	The active special program icon will be illuminated in message centre	Only displayed when system would have normally provided off-road height, but driver has manually lowered the suspension (or the suspension system is unable to raise the vehicle)	Raise suspension manually to off-road height if possible and where appropriate
TRAILER CONNECTED OFF ROAD HEIGHT NOT SELECTED AUTOMATICALLY	The active special program icon will be illuminated in message centre	Advisory message displayed when Terrain Response system would normally have provided off-road height automatically, but system has detected an electrical load on trailer socket	If trailer or light board is connected, manually raise suspension to off-road height if safe to do so If nothing is connected to trailer socket, investigate trailer socket and/or Terrain Response system for fault
SELECT LOW RANGE TO ACTIVATE ROCK CRAWL	Rock crawl program icon illuminated in message centre	Terrain Response Rock Crawl special program has been requested but transfer box is in high range	Change transfer box to low range
SAND PROGRAM SELECTED	Sand program icon illuminated in message centre	Advisory message. Terrain Response Sand special program has been selected for more than 2 seconds and is currently active	None
ROCK CRAWL PROGRAM SELECTED	Rock crawl program icon illuminated in message centre	Advisory message. Terrain Response Rock Crawl special program has been selected for more than 2 seconds and is currently active	None
GRASS GRAVEL SNOW PROGRAM SELECTED	Grass gravel snow program icon illuminated in message centre	Advisory message. Terrain Response Grass Gravel Snow special program has been selected for more than 2 seconds and is currently active	None
MUD RUTS PROGRAM SELECTED	Mud-ruts program icon illuminated in message centre	Advisory message. Terrain Response Mud/Ruts special program has been selected for more than 2 seconds and is currently active	None
GRASS GRAVEL SNOW	Grass gravel snow program icon illuminated in message centre	Advisory message. Terrain Response rotary control has been moved to the Grass Gravel Snow position. Program will be selected after 2 seconds	None
MUD-RUTS	Mud-ruts program icon illuminated in message centre	Advisory message. Terrain Response rotary control has been moved to the Mud/Ruts position. Program will be selected after 2 seconds	None
SAND	Sand program icon illuminated in message centre	Advisory message. Terrain Response rotary control has been moved to the Sand position. Program will be selected after 2 seconds	None
ROCK CRAWL	Rock crawl program icon illuminated in message centre	Advisory message. Terrain Response rotary control has been moved to the Rock Crawl position. Program will be selected after 2 seconds	None

Message	Other Warnings	Reason	Action
PROGRAM CHANGE IN PROGRESS	Selected special program icon illuminated in message centre	Vehicle operating conditions prevent selection of program. This may be caused by ABS or DSC activity or electronically controlled differential(s)	If operating conditions change within 60 seconds, selected program will be activated. If message caused by electronically controlled differential(s) overheat, allow differential(s) to cool and attempt to reselect program.
SUSPENSION FAULT NORMAL HEIGHT ONLY	Two chimes, amber indicator permanently illuminated.	A fault has been detected in the air suspension system. Only normal height is available.	Connect an approved Land Rover diagnostic system to diagnose fault
SUSPENSION FAULT MAX SPEED 40 km/h or 25 MPH	Two chimes repeated regularly. Red indicator permanently illuminated.	A major fault detected in air suspension system. Height cannot be controlled correctly.	Connect an approved Land Rover diagnostic system to diagnose fault
SLOW DOWN OR VEHICLE WILL RAISE	Two chimes	Vehicle will rise automatically to normal height from crawl (locked access) height if vehicle speed increases.	Ensure the vehicle speed does not exceed 18.6 mph (30 km/h)
SLOW DOWN OR VEHICLE WILL LOWER	Two chimes	Vehicle will automatically lower to normal height from off road height if vehicle speed increases.	Ensure the vehicle speed does not exceed 18.6 mph (30 km/h)
SUSPENSION WILL RAISE WHEN SYSTEM COOLED	One chime	Air suspension compressor is cooling. Lifting will resume when compressor has cooled.	None
SUSPENSION VEHICLE RAISING SLOWLY	None	Vehicle is lifting slowly because reservoir is empty. Only displayed if lift time exceeds 12 seconds. This is not a system fault	None
SUSPENSION IN EXTENDED MODE	One chime	Vehicle body has become trapped on an obstacle. Alternates with next message. Do not jack the vehicle with the engine running. The suspension will enter extended mode and the message will appear.	None
RESET SUSPENSION HEIGHT IF CLEAR OF OBSTACLE	None	Reselect height if door is open or press switch to exit extended mode.	None
SUSPENSION LOCKED AT ACCESS HEIGHT	None	Crawl (locked access) mode selected.	None
SUSPENSION ACCESS HEIGHT SELECTED	None	Access height selected.	None
SUSPENSION NORMAL HEIGHT SELECTED	None	Normal height selected.	None
SUSPENSION OFF ROAD HEIGHT SELECTED	None	Off road height selected.	None
SUSPENSION REMOTE KEY OPERATION	Continuous chime while height is changing.	Air suspension remote control function is being operated.	None
SUSPENSION CLOSE DOOR TO CHANGE HEIGHT	One chime	Air suspension height change is prevented because a door is open.	Close all doors
SUSPENSION SPEED TOO HIGH TO CHANGE HEIGHT	One chime	A height change has been requested but is prevented because speed is too high.	None
SUSPENSION FAULT	Two chimes, amber indicator permanently illuminated.	A fault has been detected in the air suspension system. System may still operate normally.	Connect an approved Land Rover diagnostic system
SUSPENSION START ENGINE TO RAISE VEHICLE	One chime	Vehicle height can only be raised with the engine running.	Start engine
KEY BATTERY LOW PLACE IN IGNITION TO CHARGE	None	Handset battery low	Place key in ignition to charge

Message	Other Warnings	Reason	Action
SUSPENSION FAULT VEHICLE LEAN WHEN CORNERING	Amber indicator lamp will be permanently illuminated	Dynamic Response system (if fitted) no longer available. Vehicle is still driveable.	Connect an approved Land Rover diagnostic system to diagnose fault
SUSPENSION FAULT STOP SAFELY STOP ENGINE	The red indicator lamp will flash accompanied by a chime	Major Dynamic Response system (if fitted) component failure, stop vehicle immediately.	Connect an approved Land Rover diagnostic system to diagnose fault
MEMORY 1 SELECTED	Double chime when selection complete	Memory system - confirmation that selection is completed	None
MEMORY 2 SELECTED	Double chime when selection complete	Memory system - confirmation that selection is completed	None
MEMORY 3 SELECTED	Double chime when selection complete	Memory system - confirmation that selection is completed	None
MEMORY 1 STORED	Single chime	Memory system - confirmation that memory has stored driver information	None

DPF FULL VISIT DEALER	None	The DPF software has detected the DPF is still blocked after the driver has performed the regeneration drive cycle.	Dealer should use a Land Rover approved diagnostic system and perform a diagnostic routine to regenerate the DPF.

Some messages are accompanied by graphic icons in addition to the message text.

Ambient Temperature

The external ambient air temperature is measured by a sensor located on the right hand side of the bonnet locking platform, behind the front grill. The sensor is connected to the HEVAC module. The HEVAC module outputs temperature messages on the CAN bus which are used by the instrument cluster to display the current ambient temperature.

The message centre displays the ambient temperature in the top right hand corner of the LCD display. The temperature is displayed until the message centre is required to display system information. When system information has been displayed, the ambient temperature will reappear. The temperature is displayed in ºF or ºC depending the market configuration of the vehicle. The driver can also change the temperature reading using the 'Customer Settings' function.

Cold Warning Indication

When the ambient temperature is being displayed, if the temperature falls to 3ºC (37.4ºF) or below, the cold warning symbol will display. The cold warning symbol is in the form of a snow flake and will flash on and off, five times at a frequency of 2Hz. An audible warning will also be emitted by the instrument cluster to alert the driver. After the fifth flash of the symbol, the display will change back to the current ambient temperature.

The cold warning will only be displayed once during an ignition cycle. If the ambient temperature rises to 6ºC (42.8ºF) or above and then subsequently falls to 3ºC (37.4ºF) or below during the same ignition cycle, the warning will be repeated.

If the display mode changes to a mode which does not display the ambient temperature during the warning period, the cold warning will be cancelled.

INFORMATION DISPLAY

The information display is an Liquid Crystal display (LCD) located on the right hand side at the bottom of the instrument cluster. The LCD has a viewable area of 43 mm X 20 mm with a pixel size of 0.54 mm X 0.54 mm. When active, the information display is illuminated as follows:

- Pressing of the Trip button will cause the odometer to illuminate and the odometer and trip distance only will be displayed for a period of 20 seconds
- Ignition on will cause the odometer to illuminate with the full functions displayed

When the ignition is switched on and the lights are off, the information display will illuminate at full, normal brightness, controlled by the ambient light sensor. If the lights are switched on, the intensity of illumination is reduced to a level determined by the PWM dimmer control located on the lighting control switch.

The data shown in the information display is provided to the instrument cluster from other subsystem modules in the form of CAN bus messages. The odometer and trip meter information is derived from the ABS module, the transmission information is supplied from the transmission control module for automatic transmission vehicles or from the transfer box control module for manual transmission.

Odometer

The odometer displays the total distance which the vehicle has travelled. This is calculated by a microprocessor in the instrument cluster using wheel speed messages from the ABS module.

The odometer display can show 6 characters and distances up to 999,999 miles or kilometres. When the ignition is switched off, the odometer reading can be displayed by pressing the trip rest button. The reading will illuminate for a short time before extinguishing.

The total distance travelled is recorded in the instrument cluster Electronically Erasable Programmable Read Only Memory (EEPROM) and the Random Access Memory (RAM). This ensures that the total distance is not lost if the battery is disconnected. The distance is read and stored every 2 kilometres or miles travelled.

Trip Meter

The trip meter displays the total distance which the vehicle has travelled since the last trip meter reset. The trip meter display can show four characters, with a decimal point separating the fourth character which displays 1/10th mile or kilometre. The trip meter can display up to 999.9 miles or kilometres. When this figure is exceeded, the trip display starts again from 000.0 miles or kilometres.

The trip meter can be reset by pressing the trip reset button on the instrument cluster for more than one second. The trip data is stored in the instrument cluster RAM but not in the EEPROM, therefore, if the battery is disconnected, the trip data will be lost and the display will show 000.0 when the battery is reconnected.

Gear Position Indicator

Automatic Transmission

The gear position indicator shows the current selector lever position for the automatic transmission. During normal operation the display will show 'P' for Park, 'R' for reverse, 'N' for Neutral and 'D' for Drive.

When the transmission is operated in 'CommandShift™' mode, the display shows the currently selected manual gear; 1, 2, 3, 4, 5 or 6.

The gear position indicator can also display automatic transmission fault information. The following letters are displayed to relay the fault type to the driver:

- 'F' - Transmission Control Module (TCM) has a fault and is using the default limp home mode
- 'H' - TCM has a fault, the default limp home mode is active and the transmission has reached an overheat temperature of more than 137ºC (278ºF)
- 'E' - TCM has disabled CAN bus transmission because of a CAN bus failure or because of a transmission overheat temperature of more than 140ºC (284ºF).

PRND and Sport Display

The PRND display is only active on vehicles with automatic transmission. The instrument cluster receives CAN bus messages from the TCM for the current selector lever position. This information is used by the instrument cluster to display the current selector lever position.

If the transmission selector lever is moved to the SPORT position, the term 'Sport' is displayed in the LCD. If the selector lever is subsequently moved forward or backwards the transmission operates in 'CommandShift™' mode, the 'Sport' display goes off and the gear position indicator displays the current selected manual gear.

Service Interval Indicator (SII)

The service interval indicator is displayed in the information display. This provides information to the driver warning of an impending service requirement.

The service interval is displayed for 3 seconds when the ignition is switched on providing the service interval threshold has been reached. The service interval is reset by the dealer using an approved Land Rover diagnostic system or a manual reset procedure and, once set, counts down the mileage and time in days to the next service.

The service interval varies depending on market and vehicle engine fitment. In some Eastern European countries, South American countries, Middle East and African countries and some Asia Pacific countries the SII is disabled.

Two levels of service warning are provided; remaining distance and periodic inspection.

Remaining Distance

The remaining distance is calculated by the instrument cluster by using the current odometer value and the last service reset odometer value. The instrument cluster uses these two values to calculate the distance remaining to the next service. The remaining distance value is used to display the oil service requirement.

The mileage is displayed to the nearest 50 Km or 25 miles depending on the market configuration of the vehicle. If the service interval passes zero without being reset, the instrument pack will continue counting down and the remaining distance display will show a negative (-) value.

The trigger point for displaying the remaining distance is 600 miles (1000 km) or 30 days or less depending on the market configuration of the vehicle and is contained within the Car Configuration File (CCF).

Driver Alert

When an ignition on signal is received by the instrument cluster, the cluster software performs a check to establish if any or both of the driver service alert thresholds have been reached. If a driver alert threshold has been enabled, the applicable service information will be displayed in the information display for 5 seconds. After the 5 second display has elapsed, the information display shows the normal odometer and trip information.

Reset Procedure

There are two ways of resetting the service interval indicator. An approved Land Rover diagnostic system can be connected to the vehicle and a diagnostic routine performed or a manual reset procedure can be performed using the trip reset button on the instrument cluster.

Manual Reset Procedure

- Press and hold the trip reset button.
- Turn the ignition switch on to the ignition position II.
- C. If the SII function is enabled the information display will flash 'SERVICE' for 5 seconds and then display 'SERVICE' constantly. If the SII function is not enabled the information display will show the normal odometer and trip information.
- D. If the trip reset button is released within 10 seconds of entering the reset mode, the information display will show 'DIST'.
    1. If the trip reset button is not released after 10 seconds the instrument cluster will exit the manual reset procedure.
- E. If the oil service value is to be reset, press the trip reset button within 10 seconds of releasing it and hold for more than 5 seconds. The information display will show 'RST' for 5 seconds and then reset the oil service value, the display will then show ‘END’.
- F. If the trip reset button is pressed for 5 seconds the display will exit the reset routine.
- G. If the trip reset button is not pressed for more than 10 seconds, then the information display will exit the reset routine.

CUSTOMER SETTINGS

The customer settings procedure allows the driver to adjust certain vehicle settings to change the functionality of selected vehicle functions.

The settings are stored in the instrument cluster EEPROM. Each vehicle has a factory set car configuration file which defines the settings for selected vehicle functions. The factory settings are retained and the system can be changed back to the factory default settings by either the dealer or the driver at any time.

• NOTE: The factory default settings may differ between market configuration of the vehicle.

The customer settings system is controlled by CAN bus message inputs and outputs from the instrument cluster, the Central Junction Box (CJB), the ABS Module and the Integrated Head Unit (IHU). The following table details the modules and their associated function within the settings system.

Module	Output Information
Central Junction Box (CJB)	Remote handset identity
	Ignition key position
ABS Module	Vehicle moving
Instrument Cluster	Settings Status
	Car configuration parameters
	Driver identity
Integrated Head Unit (IHU)	Scan UP button pressed
	Scan DOWN button pressed
	Volume + button pressed
	Volume - button pressed
	Distance unit request
	Consumption unit request
	Language request

The following systems/functions support the customer settings system.

- Central Junction Box (CJB)
- Instrument cluster
- Memory control module
- Navigation control module
- Interior lights (CJB function)
- Exterior lights (CJB function)
- Central door locking (CJB function).

Customer Settings Functionality

The customer settings menu is entered by pressing and holding the trip computer button on the left hand multifunction switch stalk for more than 3 seconds. For reasons of safety, the settings menu will only be displayed if the vehicle is stationary (vehicle speed signal must be below 1.8 mph (3 km/h)). This is to prevent driver distraction when operating the system. At speeds above 1.8 mph (3 km/h) the settings screen is not displayed.

Once the instrument cluster has entered the settings mode, the selections can be scrolled through in turn using the ICE radio control switches located on the steering wheel. The radio search up and down buttons |<< >>| allow for selection through the menus. The radio volume switches +/- select the values for the current menu displayed.

When the settings menu is entered, the message centre shows the 'SETTINGS' welcome message.

This display allows the driver the option of scrolling through the settings menus or exiting the settings function.

The driver can select the first settings menu by pressing the radio search button >>| or the last settings menu by pressing the radio search button |<<. After a selection is made, the setting will be saved by either proceeding to the next menu or exiting the customer settings menu. Pressing the trip computer button at any time will exit the customer settings system.

If a menu parameter is changed, it will be automatically saved when the next menu is selected or the customer settings menu is exited.

TRIP DISTANCE UNITS

The 'TRIP DISTANCE UNITS' menu allows the driver to adjust the units in which the trip distance is displayed in the trip computer display. The units can be changed using the steering wheel + or - buttons.

The menu allows the driver to select the following units:

- MILES (mph) (default)
- KM (Km/h)

FUEL USAGE UNITS

The 'FUEL USAGE UNITS' menu allows the driver to change the units in which the fuel consumption is displayed in the trip computer. The units can be changed using the steering wheel + or - buttons.

The menu allows the driver to select the following units:

- MPG (default)
- LITRE/100KM
- KM/LITRE

TEMPERATURE DISPLAY UNITS

The 'TEMP. DISPLAY UNITS' menu allows the driver to change the units in which the external temperature is displayed in the message centre. The units can be changed using the steering wheel + or - buttons.

The menu allows the driver to select the following units:

- Degrees C (default)
- Degrees F

PROGRAMMABLE OVERSPEED WARNING

The 'OVERSPEED WARNING' menu allows the driver to set the overspeed warning threshold. The threshold can be changed using the steering wheel + or - buttons.

The menu allows the driver to select the following:

- KM/H - 10 to 250 Km/h in increments of 5 Km/h. The default value is OFF.
- MPH - 10 to 140 mph in increments of 5 mph. The default value is OFF.

If the units are changed from miles to kilometres or visa versa, the overspeed warning value will go to the default OFF value.

HEADLAMP TIMER

The 'HEADLAMP OFF DELAY' menu allows the driver to adjust the delay period for the headlamp delay after the ignition is switched off function. The delay period can be changed using the steering wheel + or - buttons.

The menu allows the driver to select the following delay periods (in seconds):

- 30 (default)
- 60
- 120
- 240

DOORS LOCK ON DRIVEAWAY

The 'DRIVE AWAY DOOR LOCKING' menu allows the driver to disable or enable the door automatic lock function. The feature can be changed to on or off using the steering wheel + or - buttons.

The menu allows the driver to select the following:

- OFF
- ON (default)

MIRROR DIP IN REVERSE (if fitted)

The 'REVERSE MIRROR DIP' menu allows the driver to disable or enable the automatic exterior mirror dip in reverse function. The feature can be changed to on or off using the steering wheel + or - buttons.

The menu allows the driver to select the following:

- OFF
- ON (default)

LAZY ENTRY (if memory module fitted)

The 'LAZY ENTRY' menu allows the driver to disable or enable the lazy entry function which moves the exterior door mirror and the seat position to that set by the driver. The memory positions are stored in the memory module and the individual settings are recognised from the ignition key identification. The feature can be changed to on or off using the steering wheel + or - buttons.

The menu allows the driver to select the following:

- OFF (default)
- ON

RESTORE FACTORY SETTINGS

The 'RESTORE DEFAULT SETTINGS' menu allows the driver to change all customer settings menus to the factory default settings. The settings are programmed into the Car Configuration File (CCF) and cannot be overwritten. The defaults can be reset by selecting 'Yes' using the steering wheel + or - buttons.

The menu allows the driver to select the following:

- YES
- NO (default)

AUDIBLE WARNINGS

The instrument cluster can generate audible warnings to alert the driver to a displayed message and change of vehicle operating condition. The audible warning is generated by a sounder located within the instrument cluster. The audible warnings are categorised into one of three types; warning message \ indicator lamp alert tones, system status tones and turn signal indicator status tones. The following warning chimes are produced by various vehicle subsystems:

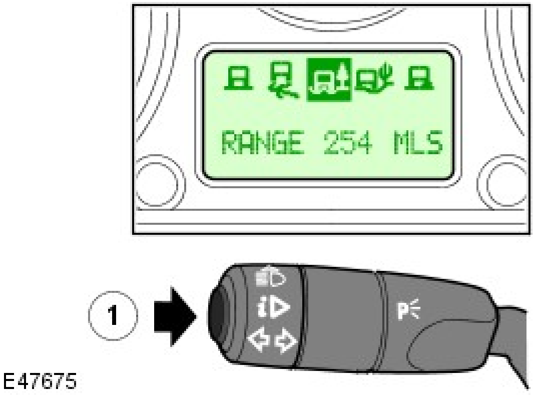
- Lights on warning
- Seat belt warning
- Turn signal indicator/hazard warning indicator warning
- Overspeed warning
- Seat memory warning
- Front parking aid warning
- Alarm system warning
- Key in warning
- Engine coolant over temperature warning
- Air suspension warning
- Tyre pressure monitoring warning
- Adaptive cruise warning
- Electronic park brake warning
- Automatic transmission warning
- Transfer box warning
- Rear differential warning
- Brake pad wear warning
- Low washer fluid warning
- ABS system fault warning
- Brake system fault warning
- Dynamic Response fault warning
- Hill descent control fault warning
- Hill descent control active warning
- Hill descent control information warning
- Supplementary restraint system warning
- Engine management system warning
- Low engine oil pressure
- Trip computer overspeed
- Water in fuel warning.

The audible warning takes the form of either a single chime, a double chime or a repeating chime. The audible warnings are initiated by a CAN bus message from the requesting subsystem control module or by the instrument cluster software.

TRIP COMPUTER

General

The instrument cluster contains software which enables the use of an on-board trip computer. The computer allows the driver to access information for current fuel usage, current journey length, average speed and estimated distance on fuel remaining. The information is displayed in the lower part of the message centre, providing no other high priority messages are being displayed. If no messages are being displayed or the displayed message is of a low priority, the trip computer will be permitted use of the message centre.



Item	Part Number	Description
1	-	Trip computer button

The driver is able to access the computer and change some parameters which control the information display using the trip computer button on the left hand multifunction switch stalk.

Trip Computer Functionality

When the engine is started the instrument cluster enters a diagnostic mode and displays a 'System Check in Progress' message in the message centre. Once complete, the instrument cluster then displays any warning messages, i.e.; DRIVER'S DOOR OPEN, in priority order.

When any applicable messages have been displayed the message centre displays information in mode 3E. Pressing the trip computer button once will display the customer settings menu, if the vehicle is stationary. If the vehicle is moving this display will be ignored and the trip computer information will be displayed in the following order:

- Trip Distance
  - The trip distance since the last reset is displayed.
  - Pressing the trip computer button for more than 2 seconds will reset the trip distance. The display will show dashes for 3 seconds and then change to zeros.
  - Pressing the trip computer button for less than 2 seconds will change the display to the next feature.
- Range
  - The range is displayed showing the distance which can be travelled using the fuel remaining in the fuel tank.
  - Pressing the trip computer button for less than 2 seconds will change the display to the next feature.
- Average Fuel Consumption
  - The average fuel Consumption is displayed.
  - Pressing the trip computer button for more than 2 seconds will reset the average fuel Consumption. The display will show dashes for 3 seconds and then change to zeros.
  - Pressing the trip computer button for less than 2 seconds will change the display to the next feature.
- Average Speed
  - The average speed is displayed.
  - Pressing the trip computer button for more than 2 seconds will reset the average speed. The display will show dashes for 3 seconds and then change to zeros.
  - Pressing the trip computer button for less than 2 seconds will change the display to the next feature.
- Overspeed Warning
  - The overspeed warning is only displayed if enabled in the customer settings.
  - Pressing the trip computer button for more than 2 seconds will turn the overspeed warning off. A second press of the trip computer button for more than 2 seconds will enable the overspeed warning.
  - Pressing the trip computer button for less than 2 seconds will change the display to the next feature.
- Warning Messages
  - Any warning messages are now displayed. If more than one message is present, each message will be shown for 3

seconds. When all messages have been shown, the display will go blank momentarily, before the display reverts to the mode 3E.

- Pressing the trip computer button for less than 2 seconds during the warning message display will cancel the trip computer and the message centre will display the mode 3E.

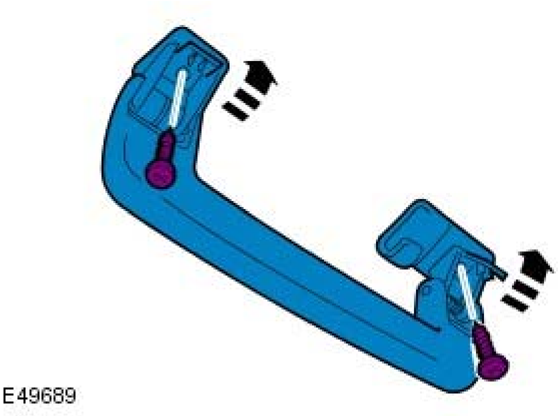
Warning Devices - Low Tire Pressure Module

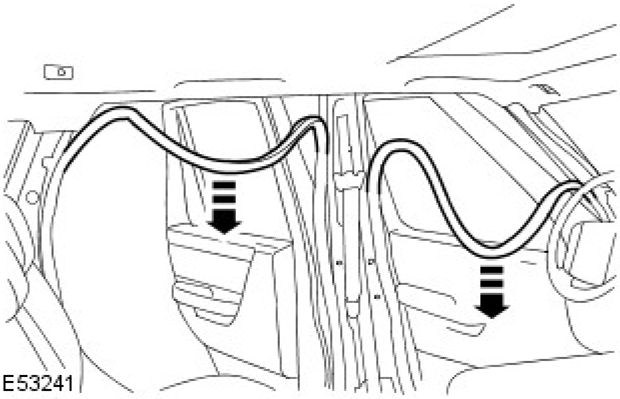
Removal and Installation

Removal

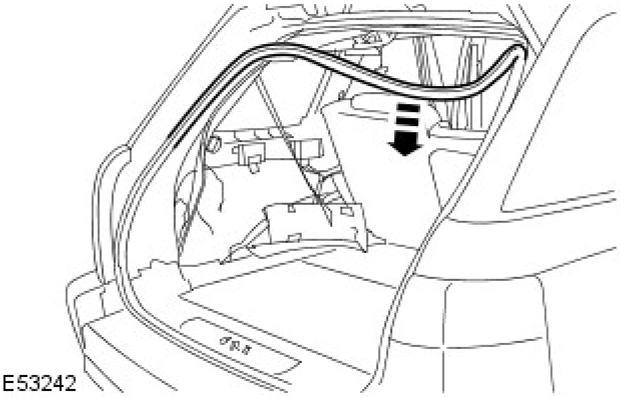
1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the LH B-pillar upper trim panel.
   For additional information, refer to: B-Pillar Upper Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Remove the LH C-pillar upper trim panel.
   For additional information, refer to: C-Pillar Upper Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).
4. Remove the LH D-pillar upper trim panel.
   For additional information, refer to: D-Pillar Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).



5. Remove the passenger assist handle.
   - Release the 2 screw covers.
   - Remove the 2 screws.
   - Repeat the above procedure for the other handle.

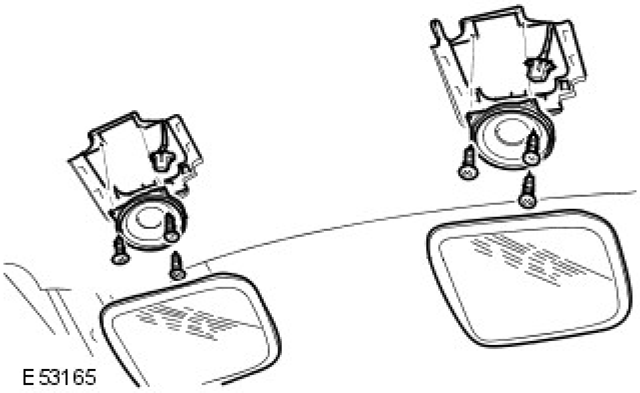


6. Release the front and rear door weatherstrips for access.



E53242

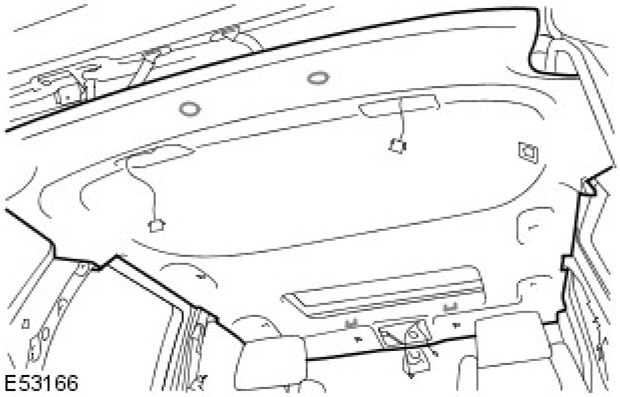
7. Release the liftgate weatherstrip



E53165

8. Remove the rear speakers.

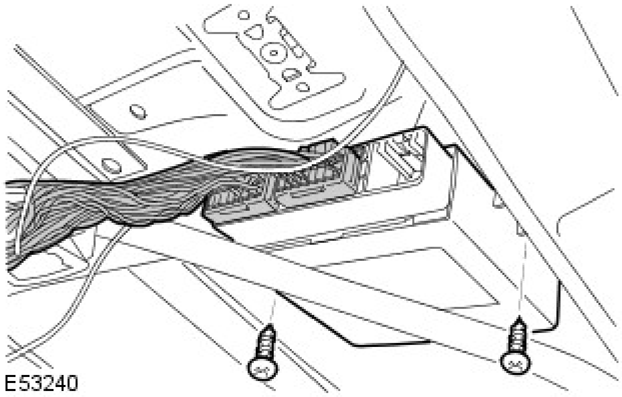
- Remove the speaker grilles.
- Remove the 6 screws.
- Disconnect the 2 electrical connectors.



E53166

9. Release the headliner for access.

- Remove the 4 screws.
- Release the 2 clips.



E53240

10. Remove the low tire pressure module.

- Release and disconnect the 2 electrical connectors.
- Remove the 2 screws.

Installation

1. Install the low tire pressure module.
   - Install the screws.
   - Connect and secure the electrical connectors.
2. Attach the headliner.
   - Install the screws.
3. Attach the door weatherstrips.
4. Install the passenger assist handles.
   - Install the screws.
   - Secure the screw covers.
5. Install the rear speakers.
   - Connect and secure the electrical connectors.
   - Install the screws.
   - Install the speaker grilles.
6. Install the D-pillar upper trim panel.
   For additional information, refer to: D-Pillar Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).
7. Install the C-pillar upper trim panel.
   For additional information, refer to: C-Pillar Upper Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).
8. Install the B-pillar upper trim panel.
   For additional information, refer to: B-Pillar Upper Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).
9. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
10. Program a new control module using T4.

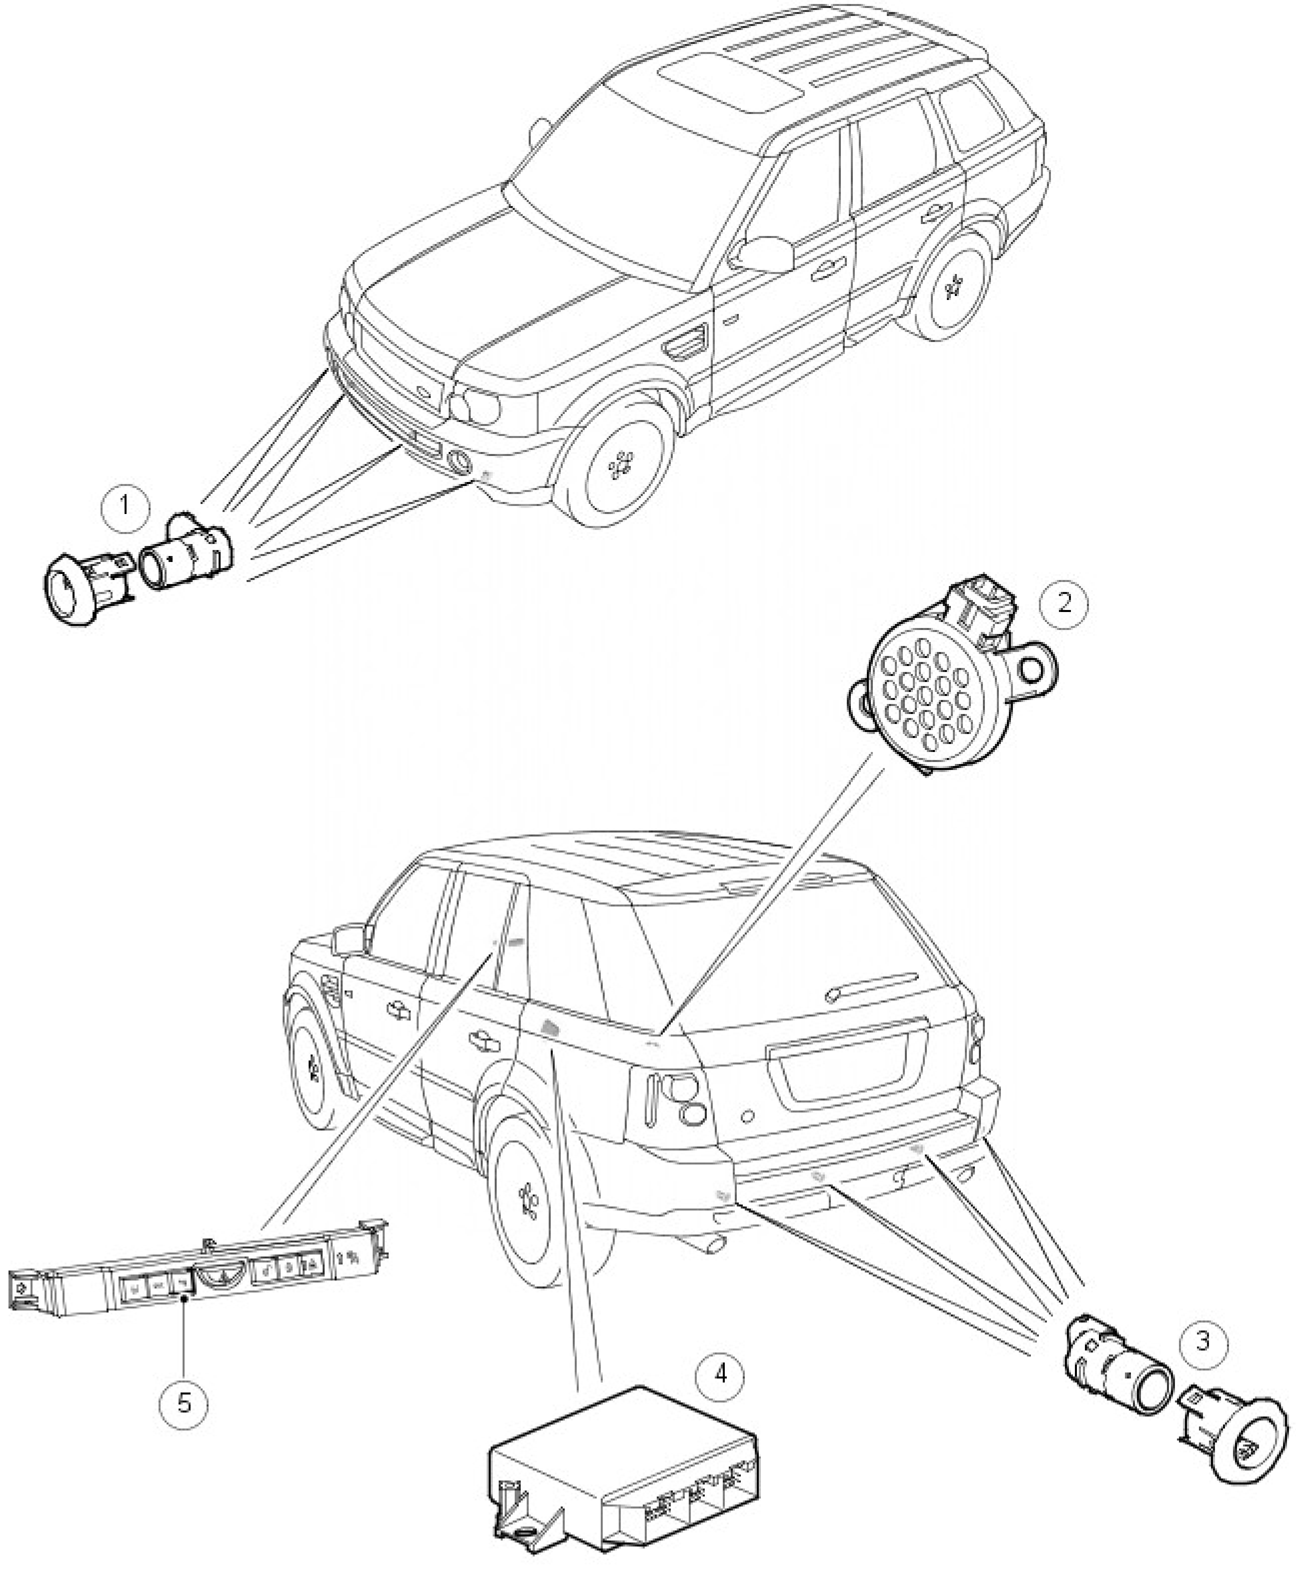
Parking Aid - Parking Aid

Description and Operation

Parking Aid Component Location



E57202

Item	Part Number	Description
1	-	Front sensors
2	-	Parking aid sounder
3	-	Rear sensors
4	-	Parking aid module
5	-	Parking aid switch

OVERVIEW

The parking aid provides an audible warning to the driver when any obstacles are in the path of the vehicle during a forward (if front sensors fitted) or reversing manoeuvre. The purpose of the system is to assist the driver when parking or manoeuvring in restricted space. It is not designed as a crash avoidance system or a replacement for visual interpretation by the driver.

The parking aid system is not standard on all vehicles and some vehicles may be fitted with rear sensors only. Higher specification vehicles may be fitted with both front and rear sensors.

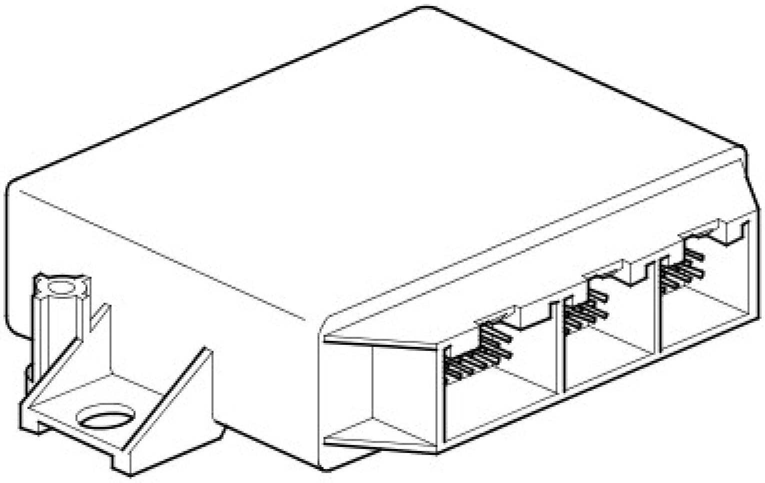
The system comprises 4 ultrasonic sensors in the rear bumper, 4 ultrasonic sensors in the front bumper (if fitted), a control module, a fascia mounted control switch, a rear sounder unit and a front sounder unit (integral with instrument cluster).

The system operates using ultrasonic signals which are transmitted by the sensors. The reflected echo from this output is received by the sensors and used by the parking aid module to calculate the distance from an object.

The fascia mounted switch allows the driver to deactivate the rear and front (if fitted) parking aid system, if operation is not required.

PARKING AID MODULE

The parking aid module is located in the rear left hand side of the luggage compartment, behind the side trim panel.

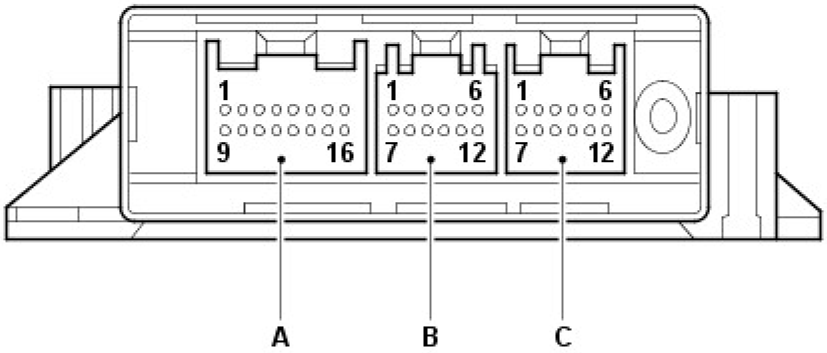


E44157

The parking aid module uses a single microprocessor to perform the following tasks:

- Control of the ultrasonic sensors
- Monitoring of the sensors
- Evaluation of received echo signals from the sensors
- Noise and disturbance suppression
- Control of the parking aid sounders
- Monitoring of the sounders and associated wiring
- Control and monitoring of the switch status LED and associated wiring
- Evaluation and monitoring of the control inputs
- Management of diagnostic and test functions
- Monitoring of power supply
- Communication via diagnostic link.

Parking Aid connector Pin Details



E44158

Item	Part Number	Description
A	-	Connector C0957
B	-	Connector C1457 (Front sensors only)
C	-	Connector C0958 (Rear sensors only)

Connector C0957

Pin No.	Description	Input/Output
1	Ignition supply	Input
2	Rear sounder	Output
3	Not used	-
4	Switch (ground)	Input
5 and 6	Not used	-
7	CAN low	Input/Output
8 and 9	Not used	-
10	Rear sounder 12V supply	Input
11 and 12	Not used	-
13	Switch LED	Output
14	CAN high	Input/Output
15	Not used	-
16	Ground	Input

Connector C01457

Pin No.	Description	Input/Output
1	Ground - Front sensors	Input
2	12V power supply - front sensors	Output
3 and 4	Not used	-
5	Sensor signal - front left outer	Input
6	Sensor signal - front left inner	Input
7	Sensor signal - front inner right	Input
8	Sensor signal - front outer right	Input

Connector C0958

Pin No.	Description	Input/Output
1	Not used	-
2	Sensor signal - rear inner right	Input
3	Sensor signal - rear inner left	Input
4	Sensor signal - rear outer right	Input
5	Sensor signal - rear outer left	Input
6 and 7	Not used	-
8	Ground - rear sensors	Input
9 and 10	Not used	-
11	12V power supply - rear sensors	Output

Pin No.	Description	Input/Output
12	Not used	-

Inputs and Outputs

Three connectors on vehicles with front and rear sensors and two connectors on vehicles with rear sensors only provide the interface between the parking aid module and the external parking aid components.

The module receives inputs from the following:

- Reverse selected - CAN message from transmission control module (automatic transmission) or transfer box control module (manual transmission)
- Forward gear selected (not in reverse or neutral) - CAN message from transmission control module (automatic transmission) or transfer box control module (manual transmission)
- Parking aid switch
- Parking brake applied - CAN message
- Trailer fitted - CAN message for Central Junction Box (CJB)
- Ignition switch - Power supply

The module outputs signals to the following:

- Sensors - power and ground connections
- Sensors - digital signal - transmit and receive signals
- Rear sounder - varying frequency output
- Front sounder - CAN message to instrument cluster
- Parking aid switch - power supply for switch LED operation

Controller Area Network (CAN) Signals

The parking aid module sends and receives a number of digital signals via the medium speed CAN. The received signals are used for operation of the parking aid system.

The parking aid module receives the messages shown in the following table which are used to control the parking aid system.

Message	Transmitted by
Vehicle speed	ABS module
Selected gear position - Automatic transmission	Transmission control module
Selected gear position - Manual transmission	Transfer case control module
Electric park brake on/off	Electric park brake module
Vehicle movement status	ABS module
Trailer connected	CJB
Ambient temperature	Automatic Temperature Control (ATC) module
Engine running status	Diesel engine control module
Stored odometer reading	Instrument cluster
Vehicle voltage level	Instrument cluster
Minute counter	Instrument cluster
Car configuration	Instrument cluster
Diagnostic physical request	A Land Rover approved diagnostic system via diagnostic socket
Diagnostic functional request	A Land Rover approved diagnostic system via diagnostic socket
Master configuration identification	Instrument cluster

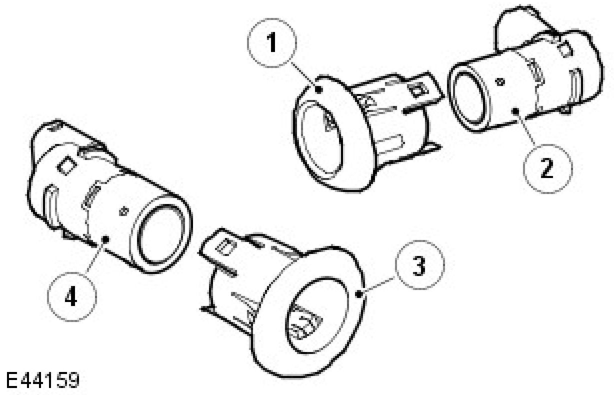
Diagnostics

The parking aid module has a diagnostic connection via the medium speed CAN to enable faults to be retrieved using a Land Rover approved diagnostic system. Additionally, an on-board diagnostic routine within the parking aid module constantly monitors the system and alerts the driver to a system fault by emitting a tone from the front or rear sounder, depending on the fault.

If a parking aid system fault has occurred, the parking aid module will relay the occurrence of the fault to the driver in the following ways:

- The status LED will flash at a frequency of 2Hz if the system is active and fault is detected in the sensors, sounders, related wiring or the module.
- The front sounder will emit an error tone for 3 seconds at a frequency of 1500Hz if a fault is detected with the front sensors or the rear sounder develops a fault.
- The rear sounder will emit an error tone for 3 seconds at a frequency of 1500Hz if a fault is detected with the rear sensors, the switch, the LED in the switch or if there is a CAN bus error.

SENSORS



Item	Part Number	Description
1	-	Front sensor housing
2	-	Front sensor
3	-	Rear sensor housing
4	-	Rear sensor

Four sensors are positioned in the rear bumper and the front bumper (if fitted). Each sensor housing has two raised location keys which locate in corresponding grooves in the bumper mounting hole and sets the correct orientation for the sensor bodies. The housings are clipped into the bumper from the front. The sensors are then clipped into the housings from the rear.

Each sensor has a three pin connector which connects into a common harness linking all four sensors. This harness is connected to the main vehicle body harness for the rear sensors or the engine compartment harness for the front sensors. The three pins are for sensor negative and positive feeds and a signal line.

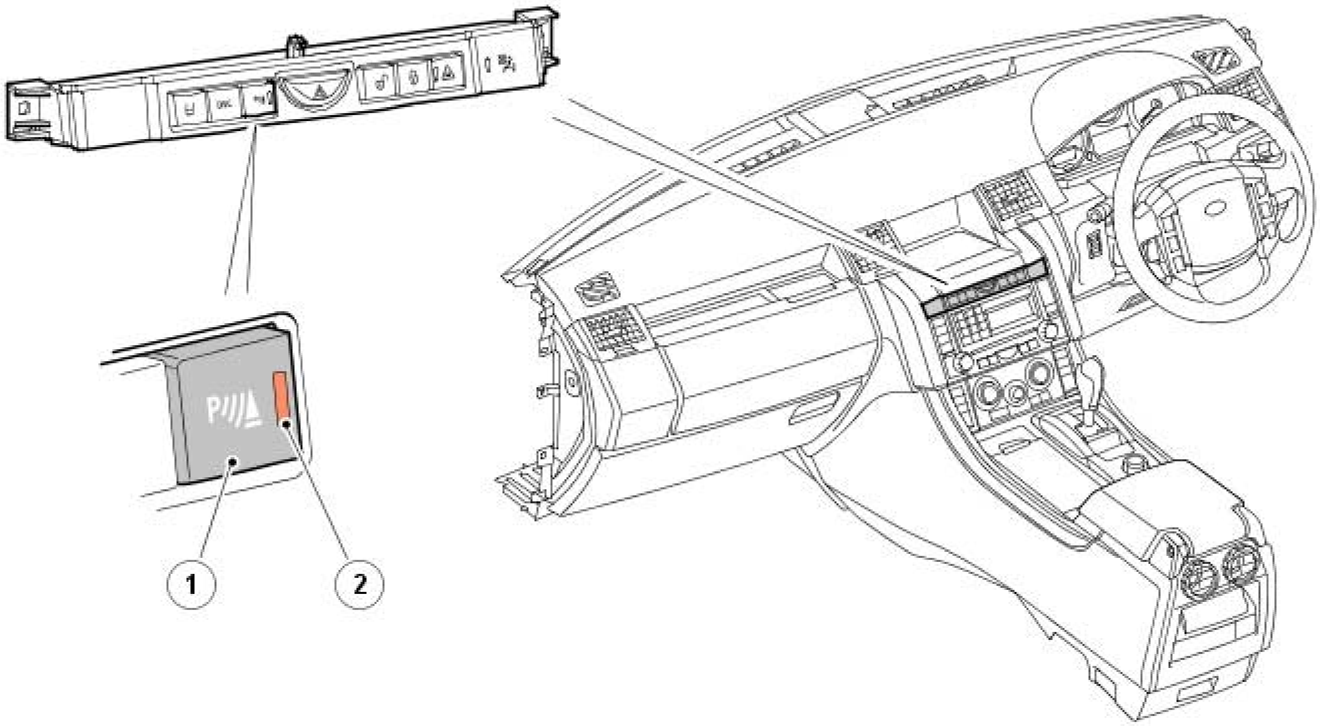
Each sensor comprises a plastic housing which contains a piezoelectric disc. The disc resonates at a frequency of 38.4 kHz, producing an ultrasonic signal output. The disc also receives the reflected echo signal.

The parking aid module controls the operating mode of each sensor by the output of a digital signal on the signal line. Each sensor has two modes of operation; combined transmitter and receiver mode or receiver mode only.

In the combined mode, the sensor emits a series of ultrasonic impulses and then switches to receiver mode to receive the echo reflected by an obstacle in the detection range. These echo signals are amplified and converted from an analogue signal to a digital signal by the sensor. The digital signal is then transmitted to the parking aid module and compared with preprogrammed data stored in an EEPROM within the module. The module receives this data via the signal line from the sensor and calculates the distance to the obstacle according to the elapsed time between the transmitted and received impulse. The duration of the impulse transmission is determined by the module. The frequency of the impulse is determined by the sensor.

In the receiver mode, the sensor will receive impulses that were emitted by adjacent sensors. The module uses this information to precisely determine position and distance of the obstacle.

PARKING AID SWITCH

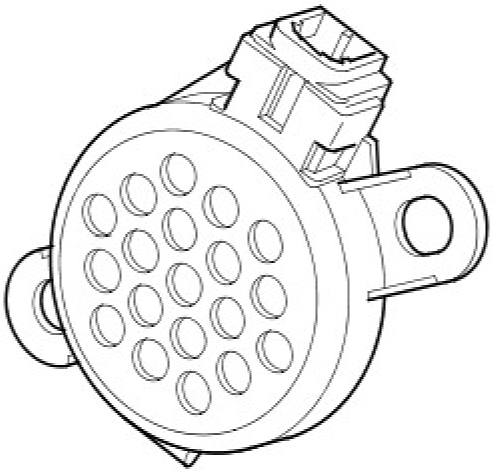


E57203

Item	Part Number	Description
1	-	Switch
2	-	LED

The parking aid switch is located in the centre console, above the IHU, to the left of the hazard warning flasher switch. The switch is a non-latching switch with an integral LED. The switch receives a 12V output to drive the LED when required. The switch is also connected to ground. When the switch is operated, the momentary completion of the ground is interpreted by the parking aid module as a signal to enable or disable the parking aid system.

PARKING AID SOUNDER



E44161

The parking aid sounder is controlled by the parking aid module and emits a series of tones of varying frequency to inform the driver of the distance between the vehicle and a detected object.

The rear parking aid sounder is located in the LH side of the luggage compartment, behind the side trim panel, below the window. The sounder is secured with two, self tapping screws into the body. The sounder is connected to the parking aid module via a harness connector.

The front parking aid uses the instrument cluster sounder and is activated by CAN messages from the parking aid module to the instrument cluster.

PARKING AID OPERATION AND DISTANCE CALCULATION

On vehicles with rear only parking aid sensors, when the ignition switch is in position II and reverse gear is selected, the parking aid sensors are automatically activated. The parking aid module only activates the system if reverse is selected for more than 1 second. This avoids nuisance audible warnings when the gear selector lever is being moved between Drive and Park.

When the rear system is activated, the parking aid module illuminates the indicator LED in the parking aid switch, switches on the ultrasonic sensors and generates a single chime on the parking aid sounder to indicate the system is active. If an object is in the range of the sensors when the system is activated, a series of audible warnings are emitted by the parking aid sounder immediately.

If parking aid operation is not required, it can be suspended temporarily by pressing the parking aid switch. On vehicles with rear only parking aid sensors, the system can be enabled again by pressing the switch again or switching the ignition off then on. The parking aid will then automatically become active again in reverse gear. The system also remains on when going from reverse gear to neutral. The assumption being that the driver may still want to manoeuvre the vehicle going backwards in neutral.

The parking aid module receives a signal on the CAN from the CJB when a trailer is fitted. When this signal is detected, the parking aid module suspends operation of the rear parking aid sensors.

On vehicles with front and rear systems, the front system is activated when the ignition switch is in position II, the vehicle is out of Park and the Electric Park Brake (EPB) is off. If the vehicle speed subsequently goes above approximately 10 mph (16 km/h), the front system will switch off. When the speed drops below approximately 6 mph (16 km/h), the front system activates again. If the EPB is applied or Park is selected, the Parking Aid system is deactivated.

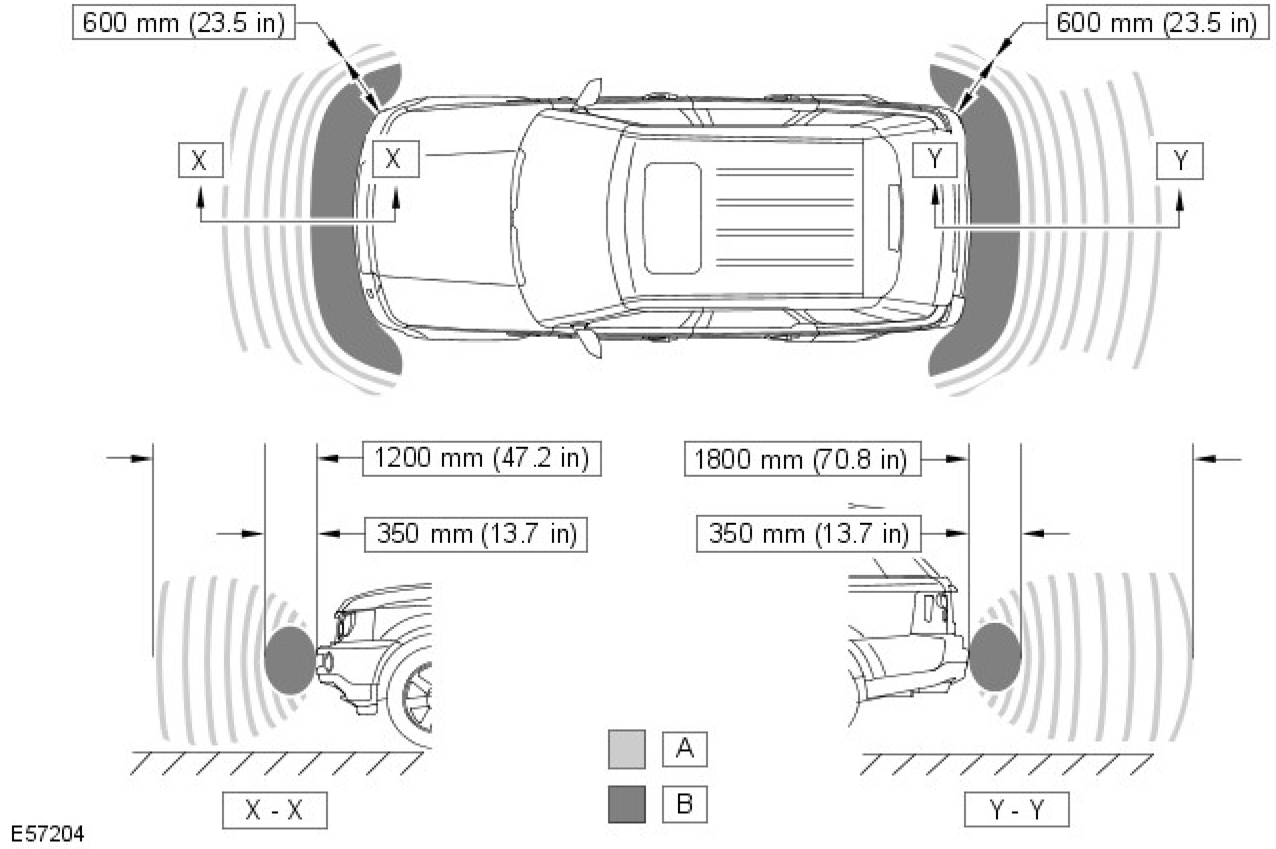
Sensor Operation

The parking aid module processes the distance readings from the ultrasonic sensors to determine if there are any objects within the detection areas. If there are no objects in the detection areas, there are no further audible warnings. If an object is detected, repeated audible warnings are produced on the parking aid sounder.

The maximum detection range is 1800 mm (70 in). When an object is detected, the time delay between the audible warning tones decreases as the distance between the detected object and the vehicle decreases until, at approximately 350 mm (13.7 in), the audible warning tone is continuous.

After the initial detection of an object, if there is no decrease in the distance between an object and the central sensors, the time delay between the audible warnings remains constant. If an object is detected by one of the corner sensors only, the audible warnings stop after about 5 seconds if there is no change in the distance between the object and the corner sensor.

Detection Area



Item	Part Number	Description
A	-	Intermittent Warning Tone
B	-	Continuous Warning Tone

Detection Calculation

When operating in the combined transmitter and receiver mode, the sensor outputs a number of ultrasonic pulses and receives the reflected echo signal. The parking aid module amplifies the received echo signals and compares them with a preprogrammed threshold to calculate the distance to the object. This is achieved by determining the elapsed time between the transmission and reception of the ultrasonic signal.

When operating in receiver mode, the sensor receives echo signals transmitted by an adjacent sensor. This mode is used to improve the accuracy of the system.

The detection cycle consists of the parking aid module operating one sensor in the combined transmitter and receiver mode and transmitting a number of ultrasonic pulses. The module then switches the transmitting sensor and the adjacent sensor(s) to receiver mode. After a short time delay, this sequence is repeated using a different sensor to transmit the ultrasonic pulse and continues until all four sensors have output an ultrasonic signal. This sequence is completed in 100ms. The module uses several measurements of the same sensors to remove errors from the calculation.

If the object is directly behind a sensor, the distance is calculated using the time between the transmission and reception of the signal. If the object is positioned between two sensors, the parking aid module uses both signals to determine the correct distance using triangulation.

To perform the triangulation calculation, the parking aid module must know the distance between the individual sensors in the bumper. This information is stored in the module memory. From the received distance from each sensor and using the known distance between adjacent sensors, the module can calculate the minimum distance from the vehicle to the object.

When approaching several objects, the module recognises the distance from the vehicle to the nearest object.

Parking Aid - Parking Aid

Diagnosis and Testing

Overview

Parking aid is installed to the rear of all vehicles and the front and rear on higher specification vehicles.

For information on the description and operation of the system, refer to the relevant workshop manual section.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.
3. **3.** Ensure that the sensor face is clear of contamination that could effect the performance of the sensor.

Visual inspection

Mechanical	Electrical
● Sensor condition and installation ● Sounder(s) ● Switch	● Fuses - Central junction box (CJB) - fuse 36P - Battery junction box (BJB) - link 11E ● Harnesses and connectors ● Sensors ● Parking aid switch ● Parking aid module

4. **4.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
5. **5.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the self-test or DTC index.
    - Make sure that all DTCs are cleared following rectification.

On-Board self-test

As part of the strategy of the system, the self-test will inform the driver of any faults by a combination of the LED and tones:

- The status LED will flash if the system is active and a fault is detected in the sensors, sounders, wiring or module
- The front sounder will emit an error tone for 3 seconds if a fault is detected with the front sensors or if the rear sounder develops a fault
- The rear sounder will emit an error tone for 3 seconds if a fault is detected with the rear sensors, the switch, or the LED in the switch, or if there is a controller area network (CAN) bus error

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
B1A0049	Control module	● Internal electronic failure	Check the power and ground supplies to the module. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
B1B3601	Front Right Outer Sensor	● Signal circuit: short circuit to ground ● Signal circuit: high resistance ● Connecter/harness problem	Refer to the electrical guides and check the sensor circuit. Check the connecter for integrity and damage. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1B3696	Front Right Outer Sensor	● Component internal failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

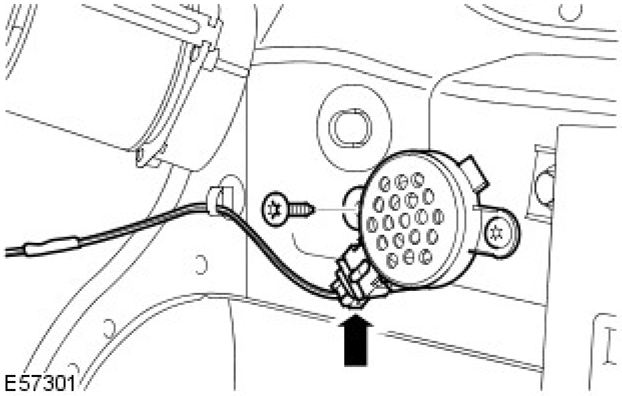
Removal and Installation

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the LH lower rear quarter trim panel.
   For additional information, refer to: Rear Quarter Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Remove the parking aid sounder.
   - Remove the 2 screws.
   - Disconnect the electrical connector.



Installation

1. Install the parking aid sounder.
   - Tighten the screws.
   - Connect and secure the electrical connector.
2. Install the rear quarter trim panel.
   For additional information, refer to: Rear Quarter Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Parking Aid - Rear Outer Parking Aid Sensor

Removal and Installation

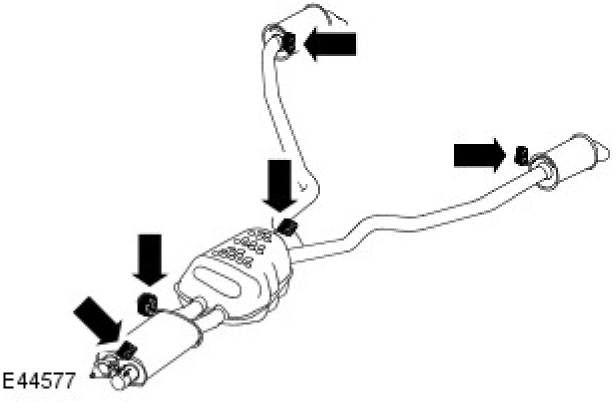
Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

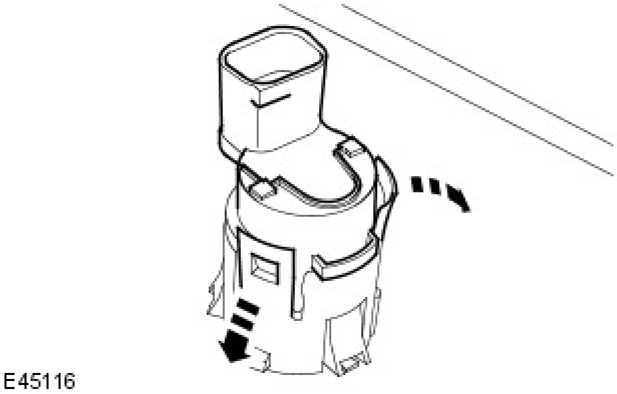
2. Release the 5 exhaust hangers.

- Support the exhaust assembly.



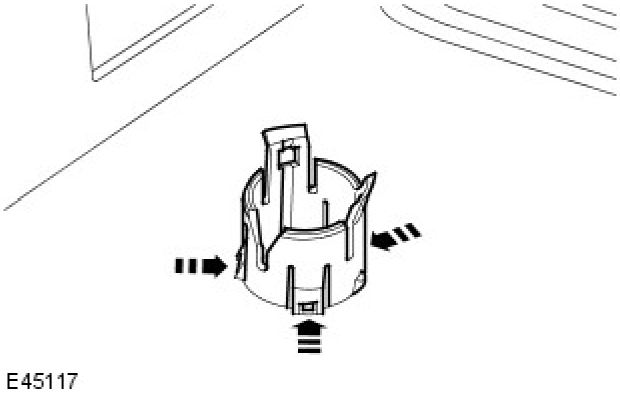
3. Remove the parking aid sensor.

- Disconnect the electrical connector.
- Release the 2 clips.



4. Remove the parking aid sensor trim panel.

- Release the 3 clips.



Installation

1. To install, reverse the removal procedure.

Procedure 1

Disconnect battery	**Connect battery**
1. If possible, apply parking brake or alternatively, chock wheels	**1.** Ensure that all electrical loads are switched **OFF**
2. Switch off ignition	**2.** Connect battery leads - GROUND lead last
3. Wait 2 minutes for engine management system to 'power down'	**3.** Switch on ignition
4. Open the hood	**4.** Operate parking brake switch several times until parking brake warning lamp is extinguished
5. Disconnect battery - GROUND lead first	

Procedure 2

Disconnect battery	**Connect battery**
1. Unlock the vehicle and disarm the alarm using the 'plip' button	**1.** Ensure that all electrical loads are switched **OFF**
2. Enter the vehicle, turn the ignition key to position II, apply the parking brake or chock the wheels and then turn the ignition key to position 0. Remove the key to 'power down' the ICE system	**2.** Connect battery leads - GROUND lead last
3. Wait 2 minutes for engine management system to 'power down'	**3.** Switch on ignition
4. Open the hood	**4.** Operate parking brake switch several times until parking brake warning lamp is extinguished
5. Disconnect battery - GROUND lead first	

- NOTE: **1. Disconnect battery -** The door unlock process initialises the ICE system.

Procedure 3

Disconnect battery	**Connect battery**
1. Unlock the vehicle from the left hand front door using the key	**1.** Ensure that all electrical loads are switched **OFF**
2. Enter the vehicle, turn the ignition key to position II, apply the parking brake or chock the wheels and then turn the ignition key to position 0. Remove the key to 'power down' the ICE system	**2.** Connect battery leads - GROUND lead last
3. Wait 2 minutes for engine management system to 'power down'	**3.** Switch on ignition
4. Open the hood	**4.** Operate parking brake switch several times until parking brake warning lamp is extinguished
5. Disconnect battery - GROUND lead first	

- NOTE: **1. - Disconnect battery -** The door unlock process initialises the ICE system

- NOTE: **1. Connect battery -** If there is insufficient capacity in the battery to disarm the alarm, the alarm may sound on reconnection of the battery - Step 3 will disarm the alarm

Procedure 4

Disconnect battery	Connect battery
1. Enter the vehicle, turn the ignition key to position II, apply the parking brake or chock the wheels and then turn the ignition key to position 0. Remove the key to 'power down' the ICE system	**1.** Ensure that all electrical loads are switched **OFF**
2. Wait 2 minutes for engine management system to 'power down'	**2.** Connect battery leads - GROUND lead last
3. Open the hood	**3.** Switch on ignition
4. Disconnect battery - GROUND lead first	**4.** Operate parking brake switch several times until parking brake warning lamp is extinguished

Procedure 5

Disconnect battery	Connect battery
1. Enter the vehicle, turn the ignition key to position II, apply the parking brake or chock the wheels and then turn the ignition key to position 0. Remove the key to 'power down' the ICE system	**1.** Ensure that all electrical loads are switched **OFF**
2. Wait 2 minutes for engine management system to 'power down'	**2.** Connect battery leads - GROUND lead last
3. Open the hood	**3.** Switch on ignition
4. Disconnect battery - GROUND lead first	**4.** Operate parking brake switch several times until parking brake warning lamp is extinguished

- NOTE: **1. Disconnect battery -** If the remote control module (RCM) is not functioning, it will be necessary to manually unlock the vehicle using the key.

Vehicle Jump (Emergency) Starting - Using Another Vehicle

Carry out the following operations in the sequence given
1. Connect one end of the BLACK (-) booster cable to the GROUND (-) battery terminal of the **DONOR** vehicle
2. Connect the other end of the BLACK (-) booster cable to a good earth point e.g. unpainted metal surface or engine mounting at least 0.5 m (20.0 in) from the battery or fuel lines on the **DISABLED** vehicle
3. Connect one end of the RED (+) booster cable to the positive (+) battery terminal of the **DONOR** vehicle
4. Connect the other end of the RED (+) booster cable to the positive (+) battery terminal of the **DISABLED** vehicle
5. Start the engine of the **DONOR** vehicle and allow it to idle for a few minutes
6. Start the engine of the **DISABLED** vehicle
7. Allow engines of both vehicles to idle for a few minutes then switch off the engine of the **DONOR** vehicle
8. Disconnect the RED (+) booster cable from the battery of the **PREVIOUSLY DISABLED** vehicle
9. Disconnect the RED (+) booster cable from the battery of the **DONOR** vehicle
10. Disconnect the BLACK (-) booster cable from the earth point of the **PREVIOUSLY DISABLED** vehicle
11. Disconnect the BLACK (-) booster cable from the battery of the **DONOR** vehicle

- WARNINGS:

⚠ During normal use, batteries emit explosive hydrogen gas sufficient to cause severe explosions and capable of causing serious injury - keep sparks and naked lights away from the engine compartment.

⚠ DO NOT attempt to start the disabled vehicle if it is suspected that the electrolyte in the battery is frozen.

⚠ Suitable eye protection must be worn when working in the vicinity of the battery.

⚠ Take care when working near rotating parts of the engine.

⚠ Prior to attempting to start the disabled vehicle, ensure that the parking brake is applied or suitably chock the wheels. Ensure that 'P' - PARK - Automatic Gearbox or NEUTRAL - Manual Gearbox is selected.

- CAUTIONS:

⚠ Ensure that all electrical loads are switched OFF prior to connecting booster cables and disconnect booster cables prior to using any electrical equipment.

⚠ Ensure that the battery of the DONOR vehicle is of 12 volt capacity and that all electrical loads on the disabled vehicle are switched OFF prior to connecting booster cables.

⚠ Ensure that there is no physical contact between the donor and disabled vehicles other than the booster cables.

Vehicle Jump (Emergency) Starting - Using a Slave Battery/Starting Aid

Carry out the following operations in the sequence given
1. Connect the end of the BLACK (-) booster cable to the ground (-) battery terminal of the vehicle
2. Connect the end of the RED (+) booster cable to the positive (+) battery terminal of the vehicle
3. Start the engine of the vehicle and allow it to idle
4. Disconnect the RED (+) booster cable from the battery terminal of the vehicle
5. Disconnect the BLACK (-) booster cable from the battery terminal of the vehicle

- WARNINGS:

⚠ During normal use, batteries emit explosive hydrogen gas sufficient to cause severe explosions and capable of causing serious injury - keep sparks and naked lights away from the engine compartment.

⚠ DO NOT attempt to start the disabled vehicle if it is suspected that the electrolyte in the battery is frozen.

⚠ Suitable eye protection must be worn when working in the vicinity of the battery.

⚠ Take care when working near rotating parts of the engine.

⚠ Prior to attempting to start the disabled vehicle, ensure that the parking brake is applied or suitably chock the wheels. Ensure that 'P' - PARK - Automatic Gearbox or NEUTRAL - Manual Gearbox is selected.

- CAUTIONS:

⚠ Ensure that all electrical loads are switched OFF prior to connecting booster cables and disconnect booster cables prior to using any electrical equipment.

⚠ Ensure that the slave battery/starting aid are of 12 volt capacity and that all electrical loads on the disabled vehicle are switched OFF prior to connecting booster cables.

Battery and Charging System - General Information - Charging System

Diagnosis and Testing

Overview

For battery condition indicator information:
REFER to: Battery and Cables (414-01 Battery, Mounting and Cables, Description and Operation).
For battery charging and testing, refer to the instructions for the equipment in use in your own workshop.

The generator operates within a "smart" system, able to allow for temperature variations and optimize battery charging.

For information on the description and operation of the system: REFER to:

Generator (414-02A Generator and Regulator - V8 S/C 4.2L Petrol, Diagnosis and Testing),
Generator (414-02B Generator and Regulator - V8 4.4L Petrol, Description and Operation),
Generator (414-02C Generator and Regulator - TDV6 2.7L Diesel, Description and Operation),
Generator (414-02D Generator and Regulator - TDV8 3.6L Diesel, Description and Operation).

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
● Generator ● Drive belt ● Drive belt tensioner ● Generator pulley ● Check the security of the generator fittings	● Generator ● Battery ● Starter motor ● Harnesses and connectors ● Fuses - Battery junction box (BJB) - fuse 20E - Starter motor megafuse ● Charge warning light function ● Controller area network (CAN) circuits ● Engine control module (ECM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom chart

Symptom	Possible Cause	Action
Charge warning lamp does not illuminate	● Warning lamp/circuit - fault ● Generator - internal fault ● CAN Bus - circuit fault ● Engine control module - internal fault	● Check the warning lamp function with the ignition on and the engine off ● Repair the circuit as necessary ● Check for DTCs indicating a generator, CAN or engine control module fault
Charge warning lamp stays on/battery discharges	● Accessory drive belt - fault ● Generator pulley slipping on shaft ● Generator - internal fault ● Battery cable - fault ● CAN Bus - circuit fault ● Engine control module - internal fault ● Central junction box	● Check the battery and generator cables ● Refer to the electrical guides ● Check for DTCs indicating a generator fault ● Check the accessory drive belt condition and tension ● Check that the pulley does not rotate independently of the generator ● Check for DTCs indicating a CAN, central junction box or engine control module fault

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

For a full list of Engine control module (ECM) DTCs: REFER to:

Electronic Engine Controls (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, Diagnosis and Testing),
Electronic Engine Controls (303-14B Electronic Engine Controls - V8 4.4L Petrol, Diagnosis and Testing),
Electronic Engine Controls (303-14C Electronic Engine Controls - TDV6 2.7L Diesel, Diagnosis and Testing),

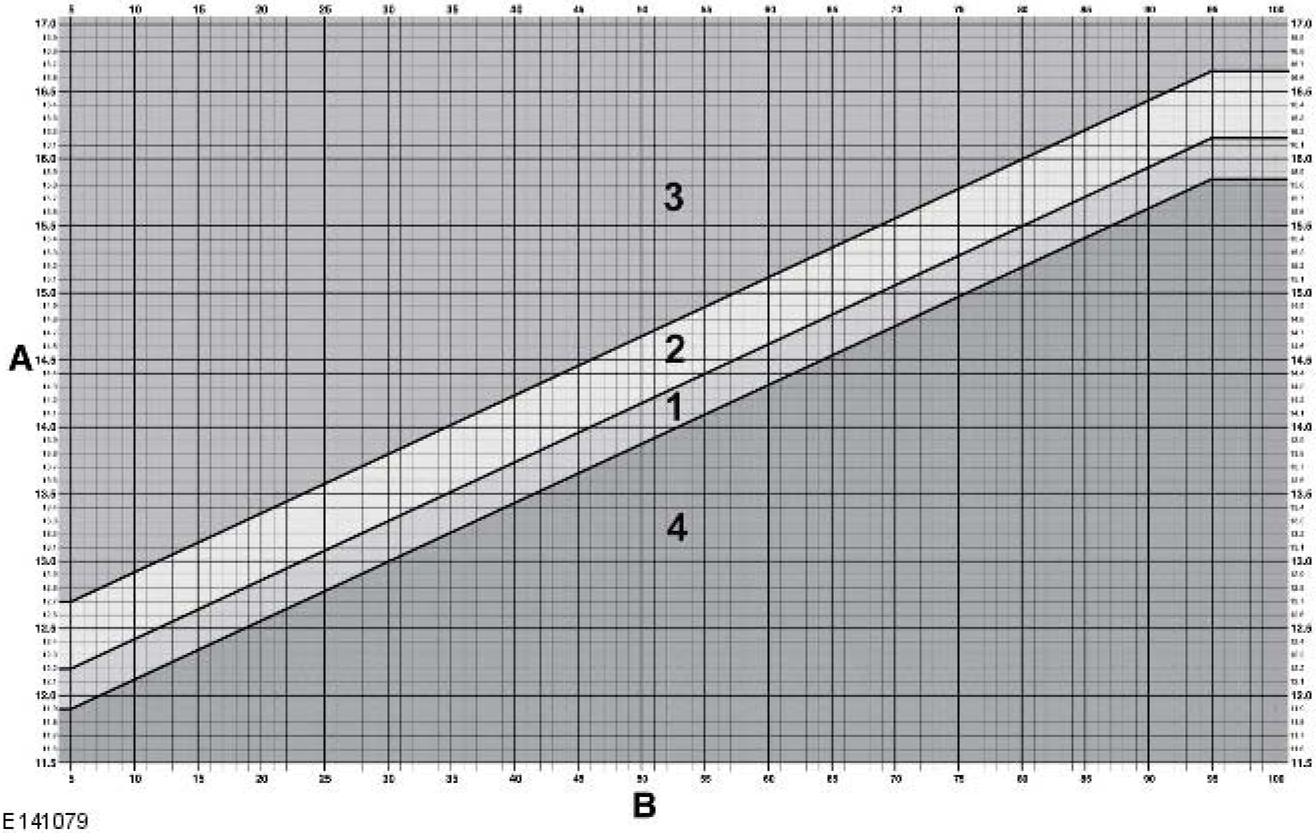
Electronic Engine Controls (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Diagnosis and Testing).

PINPOINT TEST A : DENSO NON-BMS GENERATOR DIAGNOSTIC FLOW CHART	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
A1: MIDTRONICS BATTERY TEST	
• NOTE: The battery must be fully charged and any battery defects rectified before continuing with generator diagnosis	
• NOTE: The voltmeter must display readings to three decimal places (i.e. 0.001V)	
• NOTE: **Ignition on** is position 2 on a keyed ignition system	
	1 Using a Midtronics hand held tester or the Midtronics GR-1 diagnostic charger, carry out the "Midtronics battery test" as detailed in the battery care manual. REFER to: Battery Care (414-00 Battery and Charging System - General Information, Description and Operation).
	2 Record battery diagnostic result on the provided form
	Does the battery pass the "Midtronics battery test"? **Yes** GO to Pinpoint Test B. **No** Rectify any battery defects before continuing with generator diagnosis GO to Pinpoint Test B.

PINPOINT TEST B : DENSO NON-BMS GENERATOR DIAGNOSTIC FLOW CHART	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
B1: GENERATOR DUTY CYCLE	
• NOTE: The heated rear screen is timed to operate for 10 minutes, then cycle on and off dependent on external conditions. This test requires completion within this 10 minute period	
	1 Using the manufacturer approved diagnostic system, select **Measurement Application**. Select **Complete Vehicle Data-logger**. Select **303-00 Engine System**. Select the data-logger parameter "Generator Command" to view the PWM duty %
	2 Connect a voltmeter to the vehicle battery
	3 Switch ignition state to on (engine off)
	4 Turn off all electrical loads e.g. (blower, radio, interior lights etc.)
	5 Start the engine, switch on the heated rear screen • Ensure the heated rear screen is **on** (see note above) and that the air conditioning system is **off**. • Wait 90 seconds
	6 Record battery voltage **(V1)** and generator regulator control **PWM Duty %.**. Using the graph, plot the battery voltage from your multi-meter (V1) and duty cycle readings from the manufacturer approved diagnostic system
	7 Switch off engine
	Does the generator regulator control PWM duty alternate between 40.1% and 3% in 5 sec intervals? **Yes** GO to Pinpoint Test C. **No** Use the comparison graph and instructions (below) to diagnose battery voltage **(V1)**

PINPOINT TEST C : CIRCUIT CHECK	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
C1: CIRCUIT CHECK	
	1 Refer to the electrical circuit diagrams and check **ALT MON** and **ALT COM** circuit for short circuit to ground, short circuit to power, open circuit, high resistance
	Did the circuit check pass? **Yes** Install a new generator. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component **No** Repair the circuit as required REFER to: Wiring Harness (418-02 Wiring Harnesses, Description and Operation). GO to Pinpoint Test B.

Battery Voltage V1 Graph Comparison



E141079

Plot on the graph the band to which battery voltage reading **(V1)** relates

To which band did the battery voltage **(V1)** apply?

Use the table below to continue diagnosis

Voltage	Graph Band	Link to Test Procedure
Voltage (V1) plotted during pinpoint test B1	Area **1** of the graph	GO to Pinpoint Test D.
Voltage (V1) plotted during pinpoint test B1	Area **2** of the graph	GO to Pinpoint Test E.
Voltage (V1) plotted during pinpoint test B1	Area **3** of the graph	GO to Pinpoint Test F.
Voltage (V1) plotted during pinpoint test B1	Area **4** of the graph	GO to Pinpoint Test G.

PINPOINT TEST D : GRAPH COMPARISON AREA 1	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
D1: GRAPH COMPARISON AREA 1	
	1 When the voltage **(V1)** was compared to the graph above
	Did the voltage (V1) = area 1 of the graph? **Yes** The output is within the expected range. **Do not replace the alternator**. If customer concern is still evident contact dealer technical support **No** No further action required

PINPOINT TEST E : CIRCUIT CHECKS	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
E1: CIRCUIT CHECKS	
	1 Refer to the electrical circuit diagrams and check **BATT SENSE** circuit for short circuit to ground, short circuit to power, open circuit, high resistance between: ● RR Sport & Discovery = generator connector C0053 and the engine junction box ● Range Rover = generator connector C0053 and central junction box

	Did the circuit check pass? **Yes** Install a new generator. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component **No** Repair the circuit as required REFER to: Wiring Harness (418-02 Wiring Harnesses, Description and Operation). GO to Pinpoint Test B.

PINPOINT TEST F : GRAPH COMPARISON AREA 3

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
F1: GRAPH COMPARISON AREA 3	
	1 When the voltage **(V1)** was compared to the graph above
	Did the voltage (V1) = area 3 of the graph? **Yes** Install a new generator. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component **No** No further action required

PINPOINT TEST G : GRAPH COMPARISON AREA 4

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
G1: GRAPH COMPARISON AREA 4	
	1 When the voltage **(V1)** was compared to the graph above
	Did the voltage (V1) = area 4 of the graph? **Yes** GO to Pinpoint Test H. **No** Carry out the diagnostic once more GO to Pinpoint Test B. . If customer concern is still evident contact dealer technical support

PINPOINT TEST H : REGULATOR CONTROL DUTY CYCLE

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
H1: REGULATOR CONTROL DUTY CYCLE	
	1 Using the generator regulator control duty cycle reading **PWM Duty %**
	Is the generator regulator control **PWM** duty cycle stuck at 100%? **Yes** GO to Pinpoint Test I. **No** GO to Pinpoint Test J.

PINPOINT TEST I : CIRCUIT CHECKS 1

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
I1: CIRCUIT CHECKS 1	
	1 Refer to the electrical circuit diagrams and check **ALT MON** and **ALT COM** circuits for short circuit to ground, short circuit to power, open circuit, high resistance
	Did the circuit checks pass? **Yes** Install a new generator. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component **No** Repair the circuit as required REFER to: Wiring Harness (418-02 Wiring Harnesses, Description and Operation). GO to Pinpoint Test B.

PINPOINT TEST J : CIRCUIT CHECKS 2

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
J1: CIRCUIT CHECKS 2	
• NOTE: The heated rear screen is timed to operate for 10 minutes, then cycle on and off dependent on external conditions. This test requires completion within this 10 minute period	
	1 Connect a voltmeter to the vehicle battery

	2 Switch ignition state to on (engine off) **3** Turn off all electrical loads e.g. (blower, radio, interior lights etc.) **4** Start the engine, switch on the heated rear screen ● Ensure the heated rear screen is **on** (see note above) and that the air conditioning system is **off**. **5** Voltage measurement ● Measure the voltage drop between the generator body and battery negative terminal and record the value **(V2)** **6** Voltage measurement ● Refer to the electrical circuit diagrams and measure the voltage drop between the **generator B+** and battery positive terminal and record the value **(V3)**
	Does the voltage drop value **(V2) or (V3) = less than 0.3 Volts ?** **Yes** Install a new generator. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component **No** Switch off Engine. Refer to the electrical circuit diagrams and check the generator, battery and engine, power and ground circuits for loose or corroded connections. Repair the circuit as required REFER to: Wiring Harness (418-02 Wiring Harnesses, Description and Operation). GO to Pinpoint Test B.

Battery and Charging System - General Information - Battery Care

Description and Operation

12V LEAD ACID BATTERY CARE MANUAL FOR DEALER / RETAILER USE

1. INTRODUCTION

2. GENERAL RULES FOR BATTERY CARE

3. EQUIPMENT (MINIMUM STANDARD)

4. HEALTH AND SAFETY PRECAUTIONS

5. DETERMINING BATTERY CONDITION

6. BATTERY CHARGING AND MAINTENANCE

7. CHARGING SYSTEM TEST AND DIAGNOSIS

8. VEHICLE QUIESCENT CURRENT TESTING

APPENDIX A: BATTERY TEST PROCESS

APPENDIX B: BATTERY REPORT FORM - IN SERVICE BATTERIES ONLY

1. INTRODUCTION

This publication sets out, for the benefit of dealers / retailers worldwide, requirements for the care and maintenance of batteries, from the vehicles hand-over to the dealer / retailer to the handover to the customer or in the case of a spare part battery from is delivery to the dealer / retailer to its fitment to a customer vehicle.

It applies to all types of 12 volt Lead Acid Batteries used, whether they are conventional flooded technology or Absorbed Glass Mat (AGM) technology and also applies to both Primary and Secondary or Auxiliary Batteries.

The clearly laid out and illustrated sections guide dealers / retailers through each stage of the vehicles or spare parts receipt, storage, pre-delivery and customer hand-over. This publication can be used as a guide to the handling and care of batteries in service. It is vital to appreciate that unless each process is rigorously applied on all vehicles, the customer will receive a vehicle with a battery or a spare part battery which will not provide a satisfactory service life.

It is very important that all tests quoted throughout this publication are adhered to. If they are applied incorrectly batteries could be scrapped unnecessarily. Refer to the battery testing section for detailed information.

It is equally important therefore to note the following key points:

- Most new vehicles leave the factory with either a transit relay installed and/or have a transit mode programmed into the vehicle control modules. The transit relay must be removed and the transit mode disabled (where applicable) using an approved diagnostic system, **NOT MORE THAN 24 HOURS** before the customer takes delivery.
- 12 Volt Lead Acid Batteries rely on internal chemical processes to create a voltage and deliver current. These processes and the internal chemical structure of the battery can be damaged if the battery is allowed to discharge over a number of weeks / months, or is left in a discharged state for a lengthy time period. For this reason the battery must be tested / re-charged if necessary every month, and **MUST BE** re-charged after every three month period of storage. Refer to the vehicle storage manual and update the vehicle history sheet.
- Under no circumstances should the battery be disconnected with the engine running because under these conditions the alternator can give a very high output voltage. This high transient voltage will damage the electronic components in the vehicle. Loose or incomplete battery connections may also cause high transient voltage.
- On vehicles with conventional ignition keys, these must not be left in the ignition lock barrel when the transit relay has been removed, otherwise quiescent current will increase and the battery will discharge more rapidly.
- Two types of Lead acid batteries are used; standard Flooded type and AGM (Absorbed Glass Mat) or VRLA (Valve regulated Lead Acid) types. AGM batteries offer improved resistance to cycling as seen in stop start applications. AGM Batteries are fully sealed and cannot have the electrolyte level topped up.

Dealers and retailers involved in the storage, handling of vehicles and spare parts batteries have a responsibility to ensure that only vehicles and spare parts having a fully satisfactory battery may be processed further through the distribution selling chain.

• NOTE: It is very important that test processes quoted throughout this publication are adhered to.

If they are not adhered to correctly batteries could be scrapped unnecessarily or a battery with an issue remains in use. Refer to the battery testing section for detailed information.

2. GENERAL RULES FOR BATTERY CARE

Frequency of Battery Condition Checks.

Any battery in storage whether it is in a vehicle or in spare parts inventory must have its charge status checked every 30 days as described in Appendix A, and must be recharged every 90 days as described in the "Battery Charging and Maintenance" section of this manual.

Dealer Demonstration Vehicles

Due to the high depth of discharge a dealer demonstration vehicle battery may experience, batteries that are fitted to vehicles used as dealer demonstration vehicles must be connected to a power supply / charger capable of delivering 50 Amps or more whilst the vehicle is being demonstrated and the engine is not running. This will prevent the battery from being damaged from "energy throughput " wear out during a demonstration.

Software Reflash, SDD work or Ignition On related Workshop Activities.

Due to the high electrical current demand and high depth of Discharge that can occur during vehicle software re-flash activities, SDD work or ignition on related work in the workshop, vehicles that are undergoing such activities MUST have the electrical system on the vehicle supported with a power supply / charger / vehicle maintainer capable of delivering 50 Amps or more.

Jump Starting New vehicles Before They Have Been Delivered to the Customer.

- It is the dealer / retailers responsibility to ensure the battery is not allowed to go flat by following the instructions and processes defined in this manual.
- However if circumstances dictate that a new vehicle must be jump started due to a flat battery whilst the vehicle is in the dealer / retailers care, the battery on this vehicle must be replaced with a new one prior to delivery to the customer at the dealer / retailers liability.
- The vehicle should also undergo investigation as to why the battery went flat.
- Do not connect the jump starting cable to the negative (-) terminal of the battery. Always connect to the recommended earthing point. As defined in the owners handbook or service documentation for that vehicle.

Jump Starting or Boost Charging Vehicles in Service

Do not connect the jump starting cable to the negative (-) terminal of the battery. Always connect to the recommended earthing point. As defined in the owners handbook or service documentation for that vehicle.

Charging AGM Batteries

AGM batteries must not be charged with voltages above 14.8 Volts. Doing so will damage them.

Testing AGM Batteries

Midtronics 393, 394, 493 and 494 testers are not capable of testing AGM batteries. Doing so can give an incorrect result.

When it is necessary to test an AGM battery use the Midtronics EXP1080 tester or the GR1 Diagnostics Charger.

4. HEALTH AND SAFETY PRECAUTIONS

• WARNINGS:

BATTERY CELLS CONTAIN SULPHURIC ACID AND EXPLOSIVE MIXTURES OF HYDROGEN AND OXYGEN GASES. IT IS THEREFORE ESSENTIAL THAT THE FOLLOWING SAFETY PRECAUTIONS ARE OBSERVED.

Batteries emit highly explosive hydrogen at all times, particularly during charging. To prevent any potential form of ignition occurring when working in the vicinity of a battery:

- Do not smoke when working near batteries.
- Avoid sparks, short circuits or other sources of ignition in the battery vicinity.
- Switch off current before making or breaking electrical connections.
- Ensure battery charging area is well ventilated.
- Ensure the charger is switched off when: a) connecting to a battery; b) disconnecting from the battery.
- Always disconnect the ground cable from the battery terminal first and reconnect it last.

Batteries contain poisonous and highly corrosive acid. To prevent personal injury, or damage to clothing or the vehicle, the following working practices should be followed when topping up, checking electrolyte specific gravity, removal, refitting or carrying batteries:

- Always wear suitable protective clothing (an apron or similar), safety glasses, a face mask and suitable gloves.
- If acid is spilled or splashed onto clothing or the body, it must be neutralized immediately and then rinsed with clean water. A solution of baking soda or household ammonia and water may be used as a neutralizer.
- In the event of contact with the skin, drench the affected area with water. In the case of contact with the eyes, bathe the affected area with cool clean water for approximately 15 minutes and seek urgent medical attention.
- If battery acid is spilled or splashed on any surface of a vehicle, it should be neutralized and rinsed with clean water.
- Heat is generated when acid is mixed with water. If it becomes necessary to prepare electrolyte of a desired specific gravity, SLOWLY pour the concentrated acid into water (not water into acid), adding small amounts of acid while stirring. Allow the electrolyte to cool if noticeable heat develops. With the exception of lead or lead-lined containers, always use non-metallic receptacles or funnels. Do not store acid in excessively warm locations or in direct sunlight.

Due to their hazardous contents, the disposal of batteries is strictly controlled. When a battery is scrapped, ensure it is disposed of safely, complying with local environmental regulations. If in doubt, contact your local authority for advice on disposal facilities.

5. DETERMINING BATTERY CONDITION

The tools used for determining the condition of the battery will depend upon whether it is installed in a vehicle or in spare parts inventory. Concerning an installed battery, procedures will vary if the vehicle is new, or already in service with a customer.

• NOTE: The term `New Vehicle' refers to a vehicle at any part of the delivery process from leaving the factory to arriving at a port of entry, dealership, retailer, including any storage facilities en route or a vehicle being stored prior to sale at dealership / retailer.

• NOTE: Midtronics 393, 394. 493 and 494 testers must not be used to test AGM batteries as these testers are not capable of correctly testing AGM batteries and can give an incorrect result. For AGM battery testing use the EXP1080 tester or the GR1 Diagnostics charger.

NEW VEHICLES

A Midtronics tester should be used to assess the condition of the battery for new vehicles. The test results should be recorded on the Storage History Sheet (see Vehicle Storage manual).

Scenario 1 - Dealership / Retailer (Responsibility: Dealer / Retailer)

1. Within 24 hours of arrival at the dealer / retailer proceed as follows:

- Perform a Midtronics battery test (See Appendix A.)
- Carry out the recommended actions accordingly.

2. If the Midtronics result is "Good Battery" the vehicle may be stored.

- For all new vehicles in storage the transit relay MUST be fitted, or the Transit Mode enabled where used. For vehicles without a transit relay or a Transit Mode, the battery negative cable MUST BE DISCONNECTED from the battery.

3. The battery must be tested and/or re-charged every month and MUST be re-charged after every three month period.

4. Record your test results on the Storage History Sheet (see Vehicle Storage Manual) to indicate when a re-charge will be necessary.

Scenario 2 - Delivery to the Customer (Responsibility: Dealer / Retailer)

• NOTE: It is essential that the following actions are conducted in the 24 hours prior to the agreed hand over time:

1. Perform a Midtronics Battery test (See Appendix A).

2. Carry out the recommended actions accordingly.

3. The vehicle should only be released to the customer if Midtronics has tested the battery as "Good Battery"

Spare Part Batteries

Lead acid batteries will, as a result of natural chemical processes, slowly self discharge themselves over a period of time (even when open circuit and no electrical load applied).

In the case of spare parts batteries, a Midtronics tester should be used to assess the condition of new spare parts batteries.

The batteries must be stored such that they cannot get wet and are not in direct sunlight.

Any batteries which are dropped must be scrapped. This applies even if no external damage is apparent.

Scenario 1 - Spare Part Batteries Within Dealer Stock But Not Yet Fitted To A Vehicle (Responsibility: Dealer / Retailer)

1. For a battery in the Dealer parts or in ready to use stock but not yet fitted to a vehicle the following rules must be followed:

- Check the battery condition on receipt by performing a Midtronics battery test (See Appendix A).
- Batteries should only be returned to storage if the Midtronics tester indicates "Good Battery".
- The battery condition should be rechecked every 30 days by performing a Midtronics battery test (See Appendix A).
- If required batteries should be recharged as described in the "Battery Charging and Maintenance" section of this manual.

2. 2 All batteries must be controlled via a FIFO (First In First Out) process to ensure aged batteries are not held and the batteries are not allowed to age unnecessarily.

VEHICLES IN SERVICE

The Midtronics hand-held tester or the Midtronics Diagnostic Charger are the preferred tools to assess battery condition for vehicles in service. The test results should be recorded on the In-Service Battery Report Form (See Appendix B).

Midtronics Testing - In-Service Testing Only

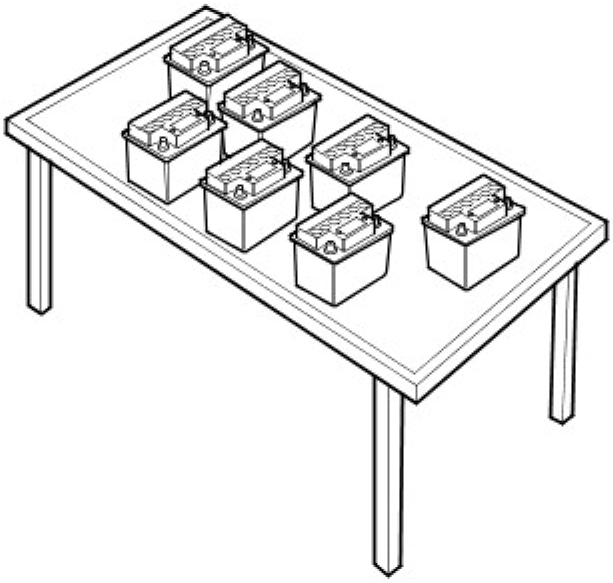
• NOTE: The battery surface charge must be removed before this test in accordance with the procedure in Appendix A. Ensure that the battery terminal connectors are clean. When connecting the Midtronics testing equipment, connect the RED clip to the positive (+) battery terminal first, and then connect the BLACK clip to the negative (-) battery terminal. Rock the clips backward and forward to ensure a good connection to the battery.

1. Perform a Midtronics battery test (See Appendix A).

2. Carry out the recommended actions accordingly.

6. BATTERY CHARGING AND MAINTENANCE

BATTERY CHARGING



E138130

It is essential that a suitably ventilated defined area exists in each dealership / retailer for battery charging. Likewise, an area should be allotted for scrap batteries, and clearly indicated as such. It is recommended that dealers / retailers always have fully charged batteries ready for use. However the battery MUST BE tested and charged if necessary every month, and charged after three months irrespective of any test.

• CAUTIONS:

⚠ Batteries must be re-charged after a maximum of 3 months storage (see Storage History sheet in the New Vehicle Storage Manual).

⚠ It is very important that when charging batteries using the traction charger or other stand-alone chargers that the charger is set for the correct type of battery before charging commences. If the wrong switch is selected the result would be a battery that is not charged fully and / or overheating can occur. Follow the manufacturers operating instructions.

⚠ Do not charge AGM batteries with voltages over 14.8 volts as this will damage the battery.

To bring a serviceable but discharged battery back to a fully charged condition proceed as follows:

- Check and if necessary top-up the battery electrolyte level.
- Charge the battery using the Midtronics Diagnostic Charger (USA) or Traction Charger (all other markets) following the manufacturers operating instructions.

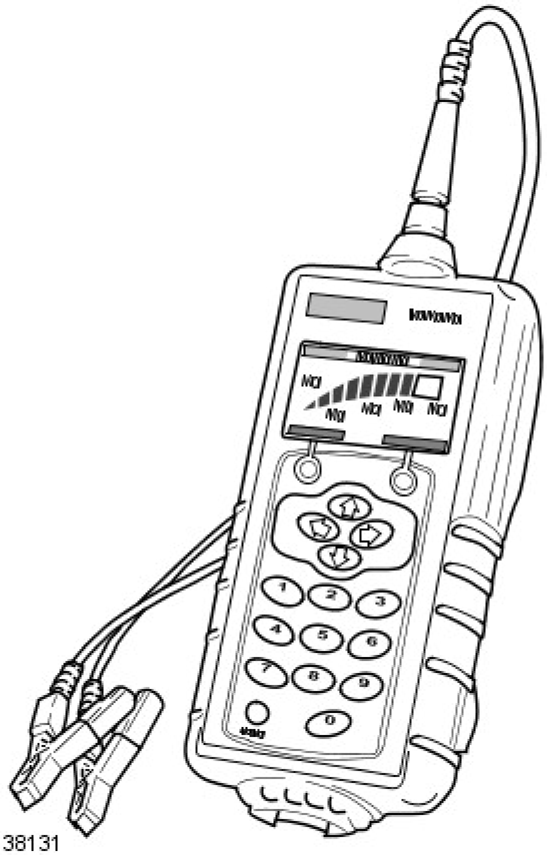
• NOTE: When using the Midtronics Diagnostic Charger, automatic mode must always be used. After charging and analysis, the charger may display ‘Top-Off Charging’, press STOP to end. Do not stop charging until the current falls to 5A or less, otherwise the battery will not be fully charged.

POST-CHARGE TEST METHODS

New Batteries, Batteries in Storage and In-Service Batteries

The purpose of this test is to ensure that the charging process has fully charged the battery.

• NOTE: IT IS RECOMMENDED THAT THIS TEST IS CONDUCTED AT LEAST 24 HOURS AFTER THE CHARGE CYCLE IS COMPLETED.



E138131

⚠ CAUTION: DO NOT connect the tester to any other circuit or chassis point.

1. Attach the Midtronics Tester to the battery.

2. Follow the instructions on the tester to test the battery. Ensure the correct battery type and size is selected.

3. Perform the action based on the tester results (see the tester results chart in the Vehicles in Service sub -section of Determining Battery Condition Section).

4. Enter the readings and test code obtained on the In Service Battery Report Form.

- NOTE: Midtronics 393, 394. 493 and 494 testers must not be used to test AGM batteries as these testers are not capable of correctly testing AGM batteries and can give an incorrect result. For AGM battery testing use the EXP1080 tester or the GR1 Diagnostics charger.

BATTERY REPLACEMENT

If it is determined that a battery requires replacement, always refer to the appropriate section of the workshop manual for instructions on removing and installing the battery from the vehicle.

On in service vehicles fitted with a Battery Monitoring System (BMS), the BMS module must be reset following the installation of a new battery. The BMS module reset procedure must be performed using an approved diagnostic system.

CHECK / TOP-UP BATTERY ELECTROLYTE – Only Applicable to certain Flooded Types of Battery.

- WARNINGS:

⚠ AGM TECHNOLOGY BATTERIES ARE FULLY SEALED FOR LIFE AND NO ATTEMPT SHOULD BE MADE TO CHECK OR TOP UP THE ELECTROLYTE LEVEL.

⚠ BEFORE CHECKING AND TOPPING-UP THE BATTERY ELECTROLYTE, REFER TO THE HEALTH AND SAFETY PRECAUTIONS SECTION.

Check to ensure the battery is of a type suitable for topping up. These types of batteries will have cell plugs visible on the top face of the battery or a removable access panel to allow access to the cells.

On batteries with a clear or opaque case and level marks, check the electrolyte level by visual inspection of the maximum level indicator mark on the battery casing indicating adequate level above the battery separators.

On batteries with black cases, remove the cell plugs or access panel and ensure the electrolyte level is level with the indicator in the cell hole. A flashlight may be required to see the electrolyte level on this type of battery.

⚠ CAUTION: **DO NOT** overfill.

If the electrolyte level is low, top-up using distilled water.

Maintenance free and Valve Regulated (AGM) batteries are sealed and therefore cannot be topped up.

CHARGING SYSTEM TEST AND DIAGNOSIS

For all vehicles, refer to the Charging System - Diagnosis and Testing in section 414-00 of the Workshop Manual.

VEHICLE QUIESCENT CURRENT TESTING

- NOTE: On vehicles fitted with a Battery Monitoring System (BMS), the diagnostic routine for quiescent drain testing in the approved diagnostic system should be utilized.

- NOTE: If a customer complains of a vehicle battery that discharges continuously or when left for a prolonged period of time, it is recommended that a quiescent drain test is performed as described below.

- NOTE: The battery drain should be measured using an approved diagnostic system or a Digital Multi-Meter (DVOM).

The vehicle should be in the locked/armed state (for example vehicle alarm fully armed), all doors, engine and luggage compartment lids are open and latched (so as to appear closed from an electrical point of view). The test should take place after the vehicle has entered shutdown mode. The time taken for this to occur after the ignition is switched off varies according to model - Refer to Quiescent Drain in section 414-00 of the Workshop Manual.

- NOTE: When the vehicle is armed, the effect of the security system Light Emitting Diode (LED) flashing is to cause a pulsation in the measured current drain. In this case, either the average current should be taken (using a Digital Multi- Meter (DVOM) with an averaging system) or the current reading taken, ignoring the brief high current peaks.

EQUIPMENT

Approved diagnostic system with current probe or Digital Multi-Meter (DVOM) with current probe.

METHOD OF MEASUREMENT

Using an Approved Diagnostic System

1. Switch off all electrical loads and ensure that the ignition is off.

2. Connect the current probe to the approved diagnostic system.

3. Calibrate the probe.

4. Install a clamp around the battery lead/junction box lead.

5. Go to the Quiescent Current Testing section.

Using a Digital Multi-Meter (DVOM)

- NOTE: Do not use an in-line DVOM to measure the quiescent drain on vehicles fitted with an electronic throttle. The current exceeds the maximum amount the fuse in the DVOM is capable of handling.

1. Switch off all electrical loads and ensure that the ignition is off.

2. Connect the current probe to the DVOM.

3. Calibrate the probe.

4. Install a clamp around the battery lead/junction box lead.

5. Go to the following Quiescent Current Testing section.

QUIESCENT CURRENT TESTING

1. Switch ignition to ‘on’ or select ignition mode in keyless vehicles and switch to ‘off’ (do not crank).

2. Remove key from ignition switch (where applicable).

3. Open and latch all doors, hood and luggage compartment lid.

4. Lock the vehicle using the remote function on the remote handset. (Single lock only to avoid volumetric alarm arming).

5. Remove any other potential electrical drains such as accessories plugged into accessory sockets.

6. Record the amperage readings after the shutdown period. The model specific Amperage readings for quiescent drain are referenced in Quiescent Drain in section 414-00 of the Workshop Manual

7. Record the final reading on the battery report form Appendix B.

• NOTE: The preferred method of testing following an excessive current consumption figure is to use a current probe around individual junction box leads to the various suspected circuits to identify a potential cause. This is in preference to the old method of removing fuses for the following reasons:

- Many modules take a considerable time to power down. Each time a fuse is removed and re-fitted, the quiescent drain current may take an extended period of time to return to normal (typically up to 45 minutes).
- The drain may be caused by a module remaining active and preventing the quiescent drain from reducing to normal levels.
- The drain may be caused by a relay winding that is activated. Pulling the fuse can allow this to ‘reset’ and the drain will be lost and go un-diagnosed.

APPENDIX A BATTERY TEST PROCESS

It is recommended that this test is conducted at least 24 hours after the vehicle engine has been run or the battery charged to avoid the need of surface charge removal or if this time constraint is unacceptable due to circumstances, then conduct the charge strip removal process.

Part 1 - Surface Charge Removal

• NOTE: Before carrying out a battery test you must ensure that there is no battery surface charge present.

• NOTE: The battery may be tested either on a bench or on the vehicle.

- In the case of on-vehicle testing, the battery must be isolated from the vehicle by removal of the battery negative (-) cable from the battery terminal before the measurement is taken unless the vehicle has a transit relay fitted or is in transit mode.

A vehicle which has had its battery charged or been driven in a 24 hour period before the test, must have its surface charge removed using one of the following methods:

1. If 24 hours have passed since the last time the engine was run or the battery charged, proceed to `Part 2 - Battery Test'.

2. Turn on the ignition. Switch on the headlamps on high beam for a minimum 3 minutes.

3. Switch off the headlamps. For vehicles tested after the transit relay has been removed, disconnect the battery by removal of the negative (-) cable. Vehicles with a transit relay fitted or with a low current transport mode enabled do not need to have the battery disconnected.

4. Wait a maximum of 5 minutes before recording test results for any battery measurements.

Part 2 - Battery Test

• NOTE: The battery surface charge must be removed before this test in accordance with the procedure in Part 1 above. Ensure that the battery terminal connectors are clean. When connecting the Midtronics testing equipment, connect the RED clip to the positive (+) battery terminal first, and then connect the BLACK clip to the negative (-) battery terminal. Rock the clips backward and forward to ensure a good connection to the battery.

• NOTE: Midtronics 393, 394. 493 and 494 testers must not be used to test AGM batteries as these testers are not capable of correctly testing AGM batteries and can give an incorrect result. For AGM battery testing use the EXP1080 tester or the GR1 Diagnostics charger.

⚠ CAUTION: **DO NOT** connect the tester to any other circuit or chassis point other than the battery negative terminal.

1. Attach the Midtronics tester to the battery.

2. Follow the instructions on the tester to test the battery. Ensure the correct battery type and size is selected.

3. Perform the action based on the tester results (see table below).

4. Enter the readings and test code obtained on the Battery Report Form (Appendix B) or equivalent which records as a minimum the technician's name, Vehicle Identification Number (VIN), Date of check, Midtronics code and Battery Voltage from the Midtronics tester.

At the end of the test, the battery negative (-) cable should be re-attached to the battery terminal.

TESTER RESULTS	**ACTION**
GOOD BATTERY	Return to service.
GOOD RE-CHARGE	Fully charge battery and return to service.
CHARGE AND RE-TEST	Fully charge battery. Remove surface charge. Re-test battery. If same result replace battery.
REPLACE BATTERY OR BAD CELL BATTERY	Verify surface charge removed. Disconnect battery from vehicle and re-test. If result repeats after surface charge removal, replace battery. **DO NOT RECHARGE**.
UNABLE TO DO TEST	Disconnect battery from vehicle and re-test.

Battery and Charging System - General Information - Quiescent Drain

Description and Operation

QUIESCENT DRAIN - TYPICAL VALUES

• NOTE: The quiescent drain after the initial shutdown period should not exceed the value shown in the table.

Land Rover Quiescent Drain Values

MODEL	SHUT DOWN PERIOD (minutes)	TYPICAL VALUES BATTERY DRAIN (mA)
Range Rover (LM) - Up to 2009MY	30	16.0 - 18.0
Range Rover (LM) - From 2010MY	20 (after lock/arm condition) ²	<30
	33 (unlocked)	<30
Range Rover Sport (LS) - Up to 2007MY	20	<22
Range Rover Sport (LS) - From 2007MY to 2010MY	30	<25
Range Rover Sport (LS) - From 2010MY	3 (after lock/arm condition) ²	<30
	33 (unlocked)	<30
Range Rover Evoque (LV) - From 2012MY	20 (after lock and arm condition)	<20
Discovery 3/LR3 (LA) - Up to 2007MY	20	<22
Discovery 3/LR3 (LA) - From 2007MY to 2010MY	30	<25
Discovery 4/LR4 (LA) - From 2010MY	3 (after lock/arm condition) ²	<30
	33 (unlocked)	<30
Freelander 2/LR2 (LF) - From 2007MY	35 (single locked or unlocked)	<23.6
	12 (double locked)	<23.6
Freelander (LN) - Up to 2007MY	10	24-25 - without Becker Navigation system
	10	27-28 - with Becker Navigation system
Defender (LD) - 1998MY to 2007MY	30	<21
Defender (LD) - from 2007MY	<30	<30
Discovery Series 2 (LT)	30	<30

• NOTE:

1. The total current drain will be higher if certain approved accessories are fitted (for example: tracker, trailer module, etc.)

2. Applies to vehicles without Tire Pressure Monitoring System (TPMS). Vehicle shut-down period with TPMS is approximately 15 minutes.

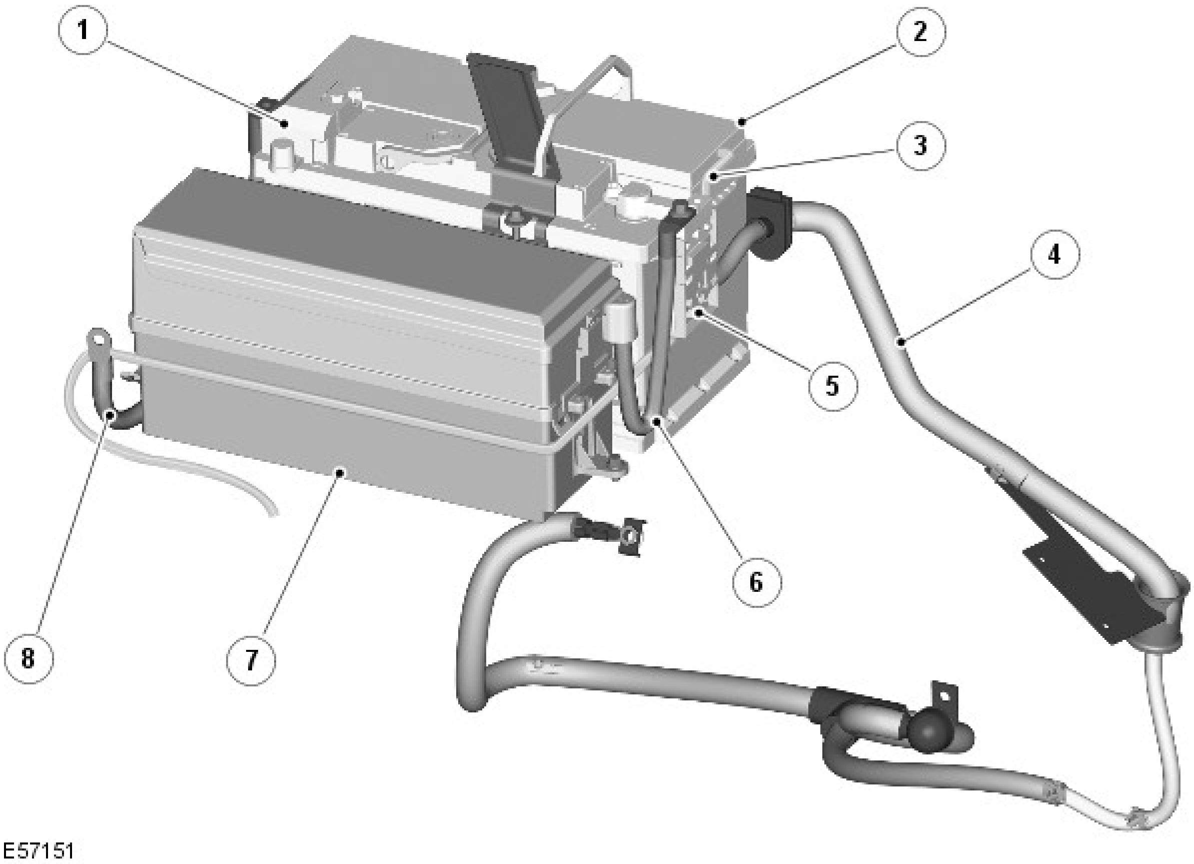
Description and Operation



Item	Part Number	Description
1	-	Transit relay
2	-	Battery
3	-	Vent pipe
4	-	Positive (+VE) battery cable
5	-	Megafuse
6	-	Power feed to the Battery Junction Box (BJB)
7	-	BJB
8	-	Negative (-VE) battery cable

OVERVIEW

The battery is mounted in a protective box, located in the engine compartment, on the passenger side. It sits in a tray and is secured with clamp plates and bolts.

The battery terminal posts allow for the battery cables to be connected with clamp type connections.

The battery positive terminal is fitted with a mega fuse, which is a 400 Amp device housed in a black fuse carrier, integral to the battery clamp. Power feed to the BJB is taken from a tap on the battery clamp before the mega fuse.

In the event of a crash the mega fuse is designed to blow, this isolates the power from the generator and starter motor, but allows power to be delivered, via the CJB, to the rest of the vehicle.

There are two different battery sizes:

- H7 - All petrol variants
- H8 - All diesel variants

The battery has a vent pipe to allow for thermal expansion and to vent oxygen and hydrogen gases, which are produced under certain charging conditions.

When removing the battery, ensure the alarm is disarmed and the ignition is switched off. Always disconnect the negative terminal first and then the positive. When refitting the battery, always fit the positive terminal first followed by the negative.

If the battery requires recharging, always use an approved constant current charger, designed for lead-calcium batteries. DO NOT use a fast charger, as permanent damage to the battery may occur.

Delivery Mode

The vehicle is fitted with a transit relay which must be removed before delivery of the vehicle to the customer. This is a disposable device and **NOT** for use by the customer. This relay fits in series with the battery and ground; it disconnects the battery from the vehicle's ground and thus eliminates quiescent current during delivery. The relay must be removed before delivery to the customer. The connector to the relay has a permanent live feed and therefore must be stowed on the given stowage point.

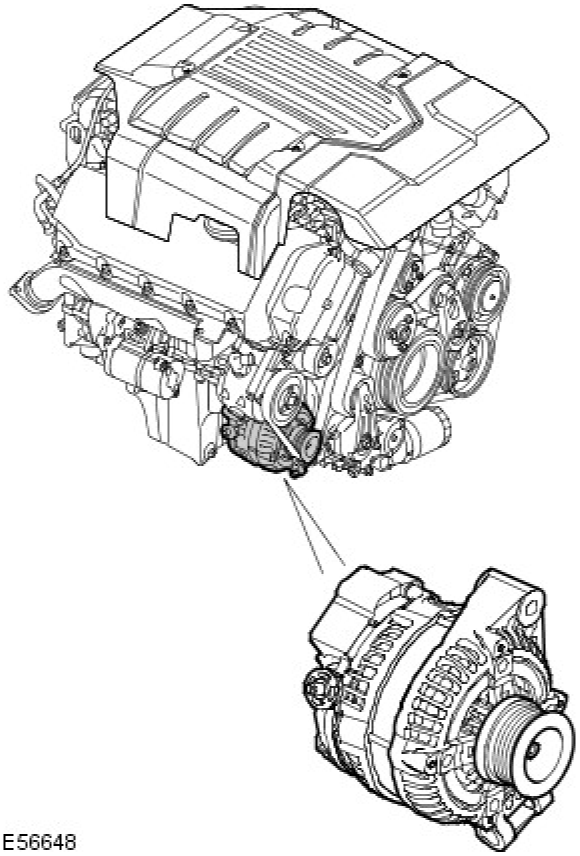
Generator and Regulator - V8 S/C 4.2L Petrol - Generator

Description and Operation



E56648

GENERAL

The generator is located at the front RH side of the engine, on the cylinder block. The generator has an output of 85/150 Amps and is manufactured by Denso. A six-ribbed polyvee belt drives the generator pulley, which in turn is driven from the engine crankshaft pulley.

The generator comprises a stator, a rotor, a rectifier pack and a regulator. There is a three-pin connector (C0053) on the generator:

Pin Number	Description
Pin 1	Voltage reference line to the battery via the Battery Junction Box (BJB), this runs through a fuse in the BJB. If the fuse is blown, the ignition/no charge warning indicator will illuminate.
Pin 2	Pulse Width Modulated (PWM) signal from the Engine Control Module (ECM) to the generator (generator control)
Pin 3	PWM signal from the generator to the ECM (generator monitoring)

The generator is connected to ground via its mountings.

The rotor comprises a field winding, wound around an iron core and mounted on a shaft. The iron core has extensions at each end, which form North and South poles as current flows through the field winding. The rotor is located inside the stator and is mounted on bearings for smooth running and to support the rotor due to the high side loading applied by the drive belt tension.

The stator has three sets of coils made from copper wire. The three coil windings are connected in a 'star' connection, where one end of the winding is connected to the other two windings. The output current is supplied from the opposite end of each winding. Rotation of the rotor causes ac current to be produced in the coils.

The rectifier converts the ac current produced in the stator coils into dc (rectified) current required by the vehicle electrical system. The rectifier comprises semi-conductor diodes mounted on a heatsink to dissipate heat. An equal number of the diodes are on the negative and positive side. An additional diode in the regulator controls feedback through the battery voltage signal line. The rectifier also prevents current flow from the battery to the generator when the output voltage is less than the battery voltage.

The 'smart' regulator controls the output voltage from the generator to protect the battery; at low temperatures battery charge acceptance is very poor so the voltage needs to be high to maximise any re-chargeability, but at high temperatures the charge voltage must be restricted to prevent excessive gassing with consequent water loss. The Engine Management System (EMS), which controls the regulator, will calculate the voltage set point required for the ensuing conditions. The 'traditional' regulator controls voltage against generator temperature, which means the battery temperature will lag a long way behind so there will be significant periods of operation when battery charging is compromised. With this system, the EMS can set the voltage by inferring the battery temperature from information received from it's various sensors, hence voltage will acurately follow the battery's needs.

The regulator has transistors, which rapidly switch on and off to regulate the voltage output according to the voltage sensed internally. The regulator also provides a PWM signal output to the ECM, which uses the signal to adjust the idle speed under varying electrical loads.

Initially, the ignition switch supply provides an excitation current to the rotor at low generator speeds via brushes, which contact slip rings at the end of the rotor shaft. As the generator speed increases the generator becomes self-exciting.

The charge warning lamp function is transmitted to the EMS and then on to the Controller Area Network (CAN) bus to the instrument cluster.

LOAD MANAGEMENT SYSTEM

The load management system comprises software resident in the Automatic Temperature Control (ATC) module . Its purpose is to protect battery state-of-charge during abnormal usage of the vehicle. The system will request the Media Orientated System Transport (MOST) ring and the air suspension to go into 'power save' mode, and will modulate features such as seat heating and screen heating to prevent the battery being dragged down to a point where the car becomes un-operational. A 'WARNING - LOW BATTERY' message will be displayed in the message center.

Removal and Installation

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

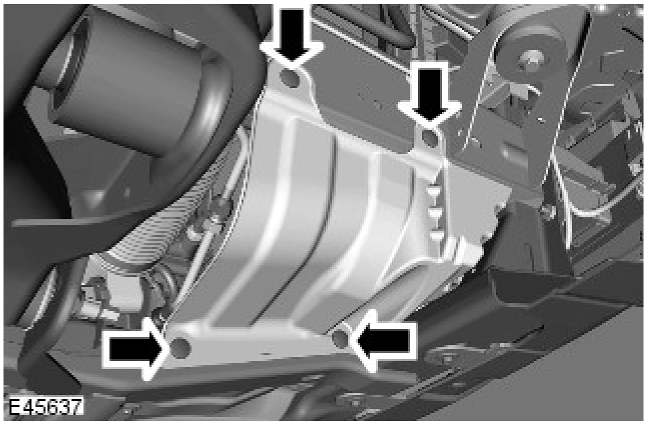
2. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

3. Remove the accessory drive belt.
   For additional information, refer to: Accessory Drive Belt (303-05A Accessory Drive - V8 S/C 4.2L Petrol, Removal and Installation).

4. Remove the front wheel.

5. Remove the front RH splash shield.

   - Remove the 4 clips.

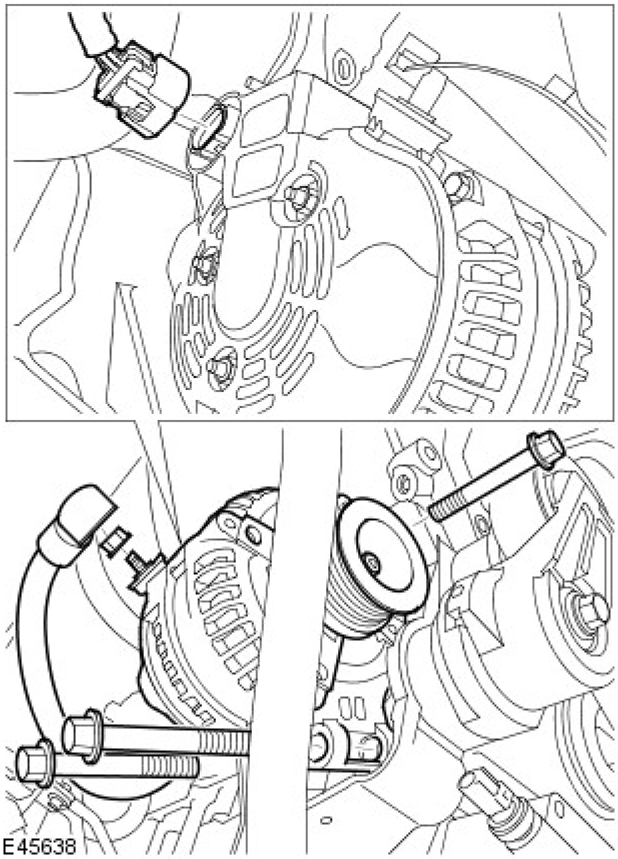


6. Remove the battery positive cable.

   - Release the battery positive cable cover.
   - Remove the retaining nut.
   - Disconnect the generator electrical connectors.

7. Remove the generator.

- Remove the 3 bolts.



Installation

1. Install the battery positive cable.

- Connect the battery positive cable.
- Tighten the retaining nut to 12 Nm (9 lb.ft).
- Connect the generator electrical connector.

2. Install the generator.

- Install and tighten the generator upper fixing bolt, before the lower bolts.
- Tighten the 3 bolts to 48 Nm (35 lb.ft).

3. Install the front RH splash shield.

- Carefully secure the clips.

4. Install the front wheel.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

5. Install the accessory drive belt.
For additional information, refer to: Accessory Drive Belt (303-05A Accessory Drive - V8 S/C 4.2L Petrol, Removal and Installation).

6. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

7. Lower the vehicle.

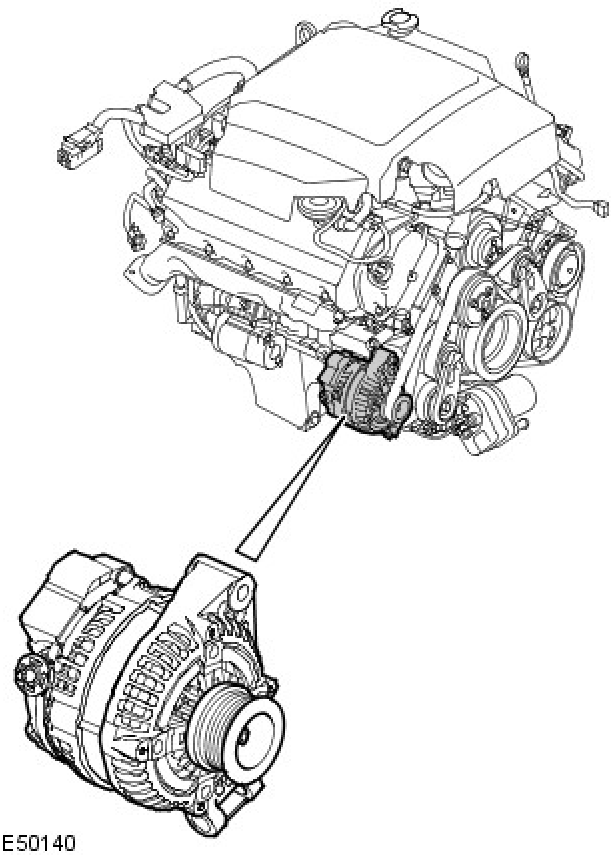
Generator and Regulator - V8 4.4L Petrol - Generator

Description and Operation



E50140

The generator is located at the front RH side of the engine, on the cylinder block. The generator has an output of 85/150 Amps and is manufactured by Denso. A six-ribbed polyvee belt drives the generator pulley, which in turn is driven from the engine crankshaft pulley.

The generator comprises a stator, a rotor, a rectifier pack and a regulator. There is a three-pin connector (C0053) on the generator:

Pin Number	Description
Pin 1	Voltage reference line to the battery via the Battery Junction Box (BJB), this runs through a fuse in the BJB. If the fuse is blown, the ignition/no charge warning indicator will illuminate.
Pin 2	Pulse Width Modulated (PWM) signal from the Engine Control Module (ECM) to the generator (generator control)
Pin 3	PWM signal from the generator to the ECM (generator monitoring)

The generator is connected to ground via its mountings.

The rotor comprises a field winding, wound around an iron core and mounted on a shaft. The iron core has extensions at each end, which form North and South poles as current flows through the field winding. The rotor is located inside the stator and is mounted on bearings for smooth running and to support the rotor due to the high side loading applied by the drive belt tension.

The stator has three sets of coils made from copper wire. The three coil windings are connected in a 'star' connection, where one end of the winding is connected to the other two windings. The output current is supplied from the opposite end of each winding. Rotation of the rotor causes ac current to be produced in the coils.

The rectifier converts the ac current produced in the stator coils into dc (rectified) current required by the vehicle electrical system. The rectifier comprises semi-conductor diodes mounted on a heatsink to dissipate heat. An equal number of the diodes are on the negative and positive side. An additional diode in the regulator controls feedback through the battery voltage signal line. The rectifier also prevents current flow from the battery to the generator when the output voltage is less than the battery voltage.

The 'smart' regulator controls the output voltage from the generator to protect the battery; at low temperatures battery charge acceptance is very poor so the voltage needs to be high to maximise any re-chargeability, but at high temperatures the charge voltage must be restricted to prevent excessive gassing with consequent water loss. The Engine Management System (EMS), which controls the regulator, will calculate the voltage set point required for the ensuing conditions. The 'traditional' regulator controls voltage against generator temperature, which means the battery temperature will lag a long way behind so there will be significant periods of operation when battery charging is compromised. With this system, the EMS can set the voltage by inferring the battery temperature from information received from it's various sensors, hence voltage will accurately follow the battery's needs.

The regulator has transistors, which rapidly switch on and off to regulate the voltage output according to the voltage sensed internally. The regulator also provides a PWM signal output to the ECM, which uses the signal to adjust the idle speed under varying electrical loads.

Initially, the ignition switch supply provides an excitation current to the rotor at low generator speeds via brushes, which contact slip rings at the end of the rotor shaft. As the generator speed increases the generator becomes self-exciting.

The charge warning lamp function is transmitted to the EMS and then on to the Controller Area Network (CAN) bus to the instrument cluster.

Removal and Installation

Removal

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

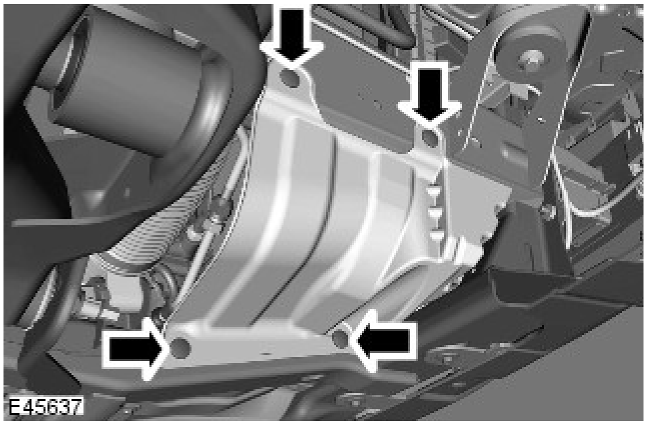
   Raise and support the vehicle.

2. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

3. Remove the accessory drive belt.
   For additional information, refer to: Accessory Drive Belt (303-05B Accessory Drive - V8 4.4L Petrol, Removal and Installation).

4. Remove the front wheel.

5. Remove the splash shield.
   For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

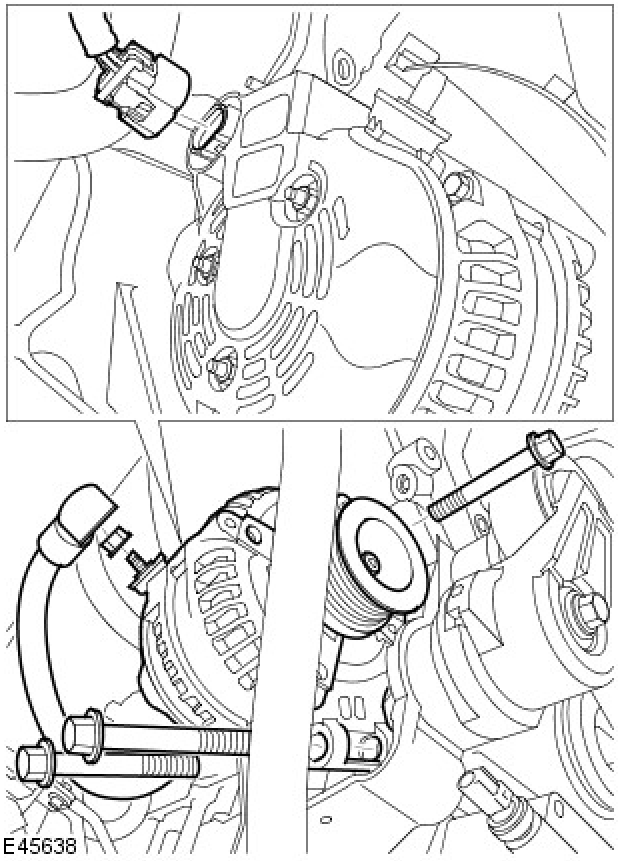


6. Remove the generator splash shield.
   - Remove the 4 clips.

7. Remove the battery positive cable.
   - Release the battery positive cable cover.
   - Remove the retaining nut.
   - Disconnect the generator electrical connectors.

8. Remove the generator.

- Remove the 3 bolts.



Installation

1. Install the battery positive cable.

   - Connect the battery positive cable.
   - Tighten the retaining nut to 10 Nm (7 lb.ft).
   - Connect the generator electrical connector.

2. Install the generator.

   - Tighten the 3 bolts to 48 Nm (35 lb.ft).

3. Install the generator splash shield.
4. Install the splash shield.
   For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).
5. Install the front wheel.

   - Tighten the wheel nuts to 140 Nm (103 lb.ft).

6. Install the accessory drive belt.
   For additional information, refer to: Accessory Drive Belt (303-05B Accessory Drive - V8 4.4L Petrol, Removal and Installation).
7. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
8. Lower the vehicle.

Generator and Regulator - TDV6 2.7L Diesel -

General Specification

Item	Specification
Generator:	
Make/Type	Denso SC2
Output	90/150 amps @ 25º C
Voltage control	By Power Control Module (PCM)
Voltage setpoint regulation	Controlled by Engine Management System (EMS)

Torque Specifications

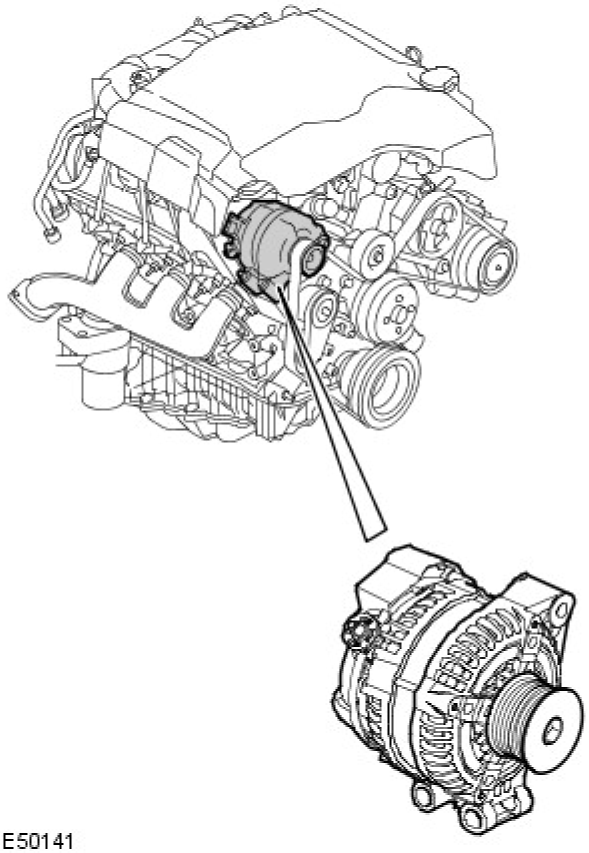
Description	Nm	lb-ft
* Battery harness connection nut	10	7

⚠ CAUTION: * Damage to the internal connections will result if this torque is exceeded

Published: 11-May-2011

Generator and Regulator - TDV6 2.7L Diesel - Generator

Description and Operation



E50141

GENERAL

The generator is located at the front RH side of the engine, in front of the RH cylinder head. The generator has an output of 85/150 Amps and is manufactured by Denso. An eight-ribbed polyvee belt drives the generator pulley, which in turn is driven from the engine crankshaft pulley.

The generator pulley incorporates a one-way clutch mechanism, which allows the pulley to free wheel, reducing the amount of inertia applied to the engine during deceleration (coast).

The generator comprises a stator, a rotor, a rectifier pack and a regulator. There is a three-pin connector (C0053) on the generator:

Pin Number	Description
Pin 1	Voltage reference line to the battery via the Battery Junction Box (BJB), this runs through a fuse in the BJB. If the fuse is blown, the ignition/no charge warning indicator will illuminate.
Pin 2	Pulse Width Modulated (PWM) signal from the Engine Control Module (ECM) to the generator (generator control)
Pin 3	PWM signal from the generator to the ECM (generator monitoring)

The generator is connected to ground via its mountings.

The rotor comprises a field winding, wound around an iron core and mounted on a shaft. The iron core has extensions at each end, which form North and South poles as current flows through the field winding. The rotor is located inside the stator and is mounted on bearings for smooth running and to support the rotor due to the high side loading applied by the drive belt tension.

The stator has three sets of coils made from copper wire. The three coil windings are connected in a 'star' connection, where one end of the winding is connected to the other two windings. The output current is supplied from the opposite end of each winding. Rotation of the rotor causes ac current to be produced in the coils.

The rectifier converts the ac current produced in the stator coils into dc (rectified) current required by the vehicle electrical system. The rectifier comprises semi-conductor diodes mounted on a heatsink to dissipate heat. An equal number of the diodes are on the negative and positive side. An additional diode in the regulator controls feedback through the battery voltage signal line. The rectifier also prevents current flow from the battery to the generator when the output voltage is less than the battery voltage.

The 'smart' regulator controls the output voltage from the generator to protect the battery; at low temperatures battery charge acceptance is very poor so the voltage needs to be high to maximise any re-chargeability, but at high temperatures the charge voltage must be restricted to prevent excessive gassing with consequent water loss. The Engine Management System (EMS), which controls the regulator, will calculate the voltage set point required for the ensuing conditions. The 'traditional' regulator controls voltage against generator temperature, which means the battery temperature will lag a long way behind so there will be significant periods of operation when battery charging is compromised. With this system, the EMS can set the voltage by inferring the battery temperature from information received from it's various sensors, hence voltage will accurately follow the battery's needs.

The regulator has transistors, which rapidly switch on and off to regulate the voltage output according to the voltage sensed internally. The regulator also provides a PWM signal output to the ECM, which uses the signal to adjust the idle speed under varying electrical loads.

Initially, the ignition switch supply provides an excitation current to the rotor at low generator speeds via brushes, which contact slip rings at the end of the rotor shaft. As the generator speed increases the generator becomes self-exciting.

The charge warning lamp function is transmitted to the EMS and then on to the Controller Area Network (CAN) bus to the instrument cluster.

LOAD MANAGEMENT SYSTEM

The load management system comprises software resident in the Automatic Temperature Control (ATC) module .
For additional information, refer to: Control Components (412-04 Control Components, Description and Operation).
Its purpose is to protect battery state-of-charge during abnormal usage of the vehicle. The system will request the Media Orientated System Transport (MOST) ring and the air suspension to go into 'power save' mode, and will modulate features such as seat heating and screen heating to prevent the battery being dragged down to a point where the car becomes un-operational. A 'WARNING - LOW BATTERY' message will be displayed in the message center.

Information and Entertainment System - General Information - Audio System

Diagnosis and Testing

Overview

The audio system combines a number of the networks and modules on the vehicle to provide a full entertainment package to the passengers.

Because of the complexity of the system, there are different techniques involved in diagnosing the system, as the networks used include controller area network (CAN) and media oriented system transport (MOST).

For information on the description and operation of the audio system, refer to the relevant section of the workshop manual. For information on diagnosis of the networks, refer to the Network Communications section of the workshop manual.

Inspection and verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
● Audio unit condition and installation ● Speaker condition and installation ● Amplifier condition and installation ● Satellite digital audio radio service system (SDARS) condition and installation ● Remote control condition and installation ● SDARS /global positioning system (GPS)/telephone antenna ● Side and rear screen antennae ● Antenna amplifiers ● Audio/Video Input/Output (AVIO) panel	● Fuses - CJB - fuse 42P - CJB - fuse 52P - CJB - fuse 53P - CJB - fuse 57P - CJB - fuse 58P - BJB - fuse 18E ● Electrical harnesses ● Fibre optic cable harnesses ● Harness connectors ● Infotainment relay ● CAN circuits ● MOST circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any DTCs before moving onto the symptom chart or DTC index.
    - ○ Because the DTCs are stored in more than one module, a complete vehicle read is recommended.
    - ○ Make sure that all DTCs are cleared following rectification.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

Audio Amplifier Module (AAM)

DTC	Description	Possible causes	Action
B1A004B	Control Module	● Amplifier shutdown requested (over-temperature)	Clear the DTC and retest. Consider the atmospheric conditions before condemning a module.
B1A0113	Speaker #1	● Left-hand rear door speaker circuit high resistance	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A011A	Speaker #1	● Left-hand rear door speaker circuit short circuit to ground ● Speaker circuit short circuit to power	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A0213	Speaker #2	● Right-hand rear door speaker circuit high resistance	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
B1A021A	Speaker #2	- Right-hand rear door speaker circuit short circuit to ground - Speaker circuit short circuit to power	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A0313	Speaker #3	- Left-hand front mid/high range speaker circuit high resistance	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A031A	Speaker #3	- Left-hand front mid/high range speaker circuit short circuit to ground - Speaker circuit short circuit to power	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A0413	Speaker #4	- Right-hand front mid/high range speaker circuit high resistance	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A041A	Speaker #4	- Right-hand front mid/high range speaker circuit short circuit to ground - Speaker circuit short circuit to power	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A0513	Speaker #5	- Left-hand bass speaker circuit high resistance	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A051A	Speaker #5	- Left-hand bass speaker circuit short circuit to ground - Speaker circuit short circuit to power	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A0613	Speaker #6	- Right-hand bass speaker circuit high resistance	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A061A	Speaker #6	- Right-hand bass speaker circuit short circuit to ground - Speaker circuit short circuit to power	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A0713	Speaker #7	- Left-hand front bass speaker circuit high resistance	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A071A	Speaker #7	- Left-hand front bass speaker circuit short circuit to ground - Speaker circuit short circuit to power	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A0813	Speaker #8	- Right-hand front bass speaker circuit high resistance	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A081A	Speaker #8	- Right-hand front bass speaker circuit short circuit to ground - Speaker circuit short circuit to power	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A0913	Speaker #9	- Left-hand rear surround speaker circuit high resistance	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A091A	Speaker #9	- Left-hand rear surround speaker circuit short circuit to ground - Speaker circuit short circuit to power	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A1013	Speaker #10	- Right-hand rear surround speaker circuit high resistance	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
B1A101A	Speaker #10	- Right-hand rear surround speaker circuit short circuit to ground - Speaker circuit short circuit to power	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A1113	Speaker #11	- Front center fill speaker circuit high resistance	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A111A	Speaker #11	- Front center fill speaker circuit short circuit to ground - Speaker circuit short circuit to power	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A1213	Speaker #12	- Bass speaker circuit high resistance	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A121A	Speaker #12	- Bass speaker circuit short circuit to ground - Speaker circuit short circuit to power	Refer to the electrical guides and check the speaker circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A9668	Bus Still Active After Shut-Down Request	- Light still active 2 seconds after shut-down request	Carry out the general MOST test. Refer to the Network Communications section of the workshop manual.
B1D8413	Headphone Panel 1	- Headphone panel 1 circuit high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1D8513	Headphone Panel 2	- Headphone panel 2 circuit high resistance	Check the power and ground circuits to the component. Refer to the electrical guides.
B1D8613	Headphone Panel 3	- Headphone panel 3 circuit high resistance	Check the power and ground circuits to the component. Refer to the electrical guides.
B1D8713	Headphone Panel 4	- Headphone panel 4 circuit high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

Audio Control Module (ACM)

• NOTE: Integrated Head Unit (IHU)

DTC	Description	Possible causes	Action
B1A5601	Antenna	- Antenna connection is broken	Refer to the electrical guides and check the antenna circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1D2101	Remote Control Switch	- General electrical failure	Check the power and ground circuits to the component. Refer to the electrical guides.
B1D2115	Remote Control Switch	- Remote control switch circuit short circuit to power - Remote control switch circuit high resistance	Refer to the electrical guides and check the remote control circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1D7901	Microphone Input	- Microphone circuit open circuit, short circuit to ground or short circuit to power - Microphone configuration mismatched with CCF	Refer to the electrical guides and check the microphone input circuit. Configure the system using the approved diagnostic system. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
U001087	Medium Speed CAN Communication Bus	- Missing message from audio unit	Check the CAN circuits. Refer to the electrical guides. Refer to the Network Communications section of the workshop manual.
U007388	Control Module Communication Bus "A" Off	- Bus off	Check for other DTCs. Clear all DTCs and a road test the vehicle. If the concern reoccurs contact Dealer Technical Support for further advice. Under no circumstance should any parts be replaced to overcome this issue. Refer to the Network Communications section of the workshop manual.
U018487	Lost Communication With Radio	- Missing message	Refer to the Network Communications section of the workshop manual.

DTC	Description	Possible causes	Action
U01874A	Lost communication with the disc player/changer module	● Lost communication with the disc player/changer module ● Incorrect component installed - The security of the MOST network prevents the unauthorized addition of a module to the system	Configure the network to accept the module using the approved diagnostic system.
U030055	Software incompatibility	● Audio unit not configured	Configure the module using the approved diagnostic system.
U1A1448	CAN Initialization Failure	● ACM supervision software failure	Check the power and ground circuits to the component. Refer to the electrical guides. Configure the module(s) using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
U1A1449	CAN Initialization Failure	● Internal electronic failure	Check the power and ground circuits to the component. Refer to the electrical guides. Configure the module(s) using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
U1A254A	Lost Communication With ICM	● Incorrect component installed - The security of the MOST network prevents the unauthorized addition of a module to the system	Carry out the general MOST test. Refer to the Network Communications section of the workshop manual.
U1A264A	Lost Communication With TEL	● Incorrect component installed - The security of the MOST network prevents the unauthorized addition of a module to the system	Carry out the general MOST test. Refer to the Network Communications section of the workshop manual.
U1A274A	Lost Communication With REM	● Incorrect component installed - The security of the MOST network prevents the unauthorized addition of a module to the system	Carry out the general MOST test. Refer to the Network Communications section of the workshop manual.
U1A284A	Lost Communication With SRM	● Incorrect component installed - The security of the MOST network prevents the unauthorized addition of a module to the system	Carry out the general MOST test. Refer to the Network Communications section of the workshop manual.
U1A294A	Lost Communication With AAM	● Incorrect component installed - The security of the MOST network prevents the unauthorized addition of a module to the system	Carry out the general MOST test. Refer to the Network Communications section of the workshop manual.
U1A304A	Lost Communication With TVM	● Incorrect component installed - The security of the MOST network prevents the unauthorized addition of a module to the system	Carry out the general MOST test. Refer to the Network Communications section of the workshop manual.
U1A314A	Lost Communication With TMC	● Incorrect component installed - The security of the MOST network prevents the unauthorized addition of a module to the system	Carry out the general MOST test. Refer to the Network Communications section of the workshop manual.
U200325	Fibre Optic Communication Bus	● Signal shape/waveform error	Carry out the general MOST test. Refer to the Network Communications section of the workshop manual.
U200331	Fibre Optic Communication Bus	● MOST ring break - no data received	Carry out the general MOST test. Refer to the Network Communications section of the workshop manual.
U200381	Fibre Optic Communication Bus	● Invalid serial data received	Carry out the general MOST test. Refer to the Network Communications section of the workshop manual.

DTC	Description	Possible causes	Action
U200386	Fibre Optic Communication Bus	- Signal invalid	Carry out the general MOST test. Refer to the Network Communications section of the workshop manual.
U200388	Fibre Optic Communication Bus	- Bus off	Carry out the general MOST test. Refer to the Network Communications section of the workshop manual.
U300044	Control Module	- Audio unit data memory failure	Check the power and ground circuits to the component. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
U300048	Control Module	- Audio unit supervision software failure (internal error)	Check the power and ground circuits to the component. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
U300049	Control Module	- Audio unit internal electronic failure (internal error)	Check the power and ground circuits to the component. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
U300055	Control Module	- Audio unit not configured - Can also be set by a harness fault - EQ Setting not equal to car information of IHU	Configure the module using the approved diagnostic system.

Front Entertainment Module (FEM)

DTC	Description	Possible causes	Action
B100E25	Video Input "A"	- Television/Rear seat entertainment video input disconnected - TV/DVD malfunction	Check that the input is connected and that the system is transmitting.
B101025	Video Input "C"	- Rear camera video input disconnected - Camera malfunction	Check that the input is connected and that the system is transmitting.
B1B0049	Sub-Module 'A'	- Navigation module internal electrical failure	Check for excessive temperature and for the correct installation of the navigation module. Install a new navigation module as required, refer to the new module/component installation note at the top of this DTC Index
B1D6249	Sub-Module 'B'	- Vehicle information and communication system (VICS) module internal electrical failure	Check the power and ground circuits to the module. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
B1D6287	Sub-Module 'B'	- Vehicle information and communication system (VICS) module circuit - short to ground - VICS module circuit - short to power - VICS module circuit - high resistance - VICS module disconnected - VICS module failure	Refer to the electrical circuit diagrams and check VICS module circuits for short to ground, power, open circuit. Check and install a new VICS module as required. Configure the system using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
U1A0087	Private Bus Circuit	- Missing message from front entertainment module (FEM) - No Connector on multi media module - Communications network fault	Refer to the lost communication statement at the start Network Communication sections of the workshop manual.
U1A0131	Communication Link	• NOTE: 'NO NAVIGATION AVAILABLE' message is displayed - Navigation module - touch screen display (TSD), gigabit video interface (GVIF) fault - GVIF disconnected - GVIF - short to ground,	Check for correct connection of GVIF circuit connectors. Refer to the electrical circuit diagrams and check the multi-media module GVIF circuits for short to ground, power, open circuit

DTC	Description	Possible causes	Action
		power, open circuit	

Rear Entertainment Module (REM)

DTC	Description	Possible causes	Action
B1A0044	Control Module	● Rear entertainment control module - data memory failure	Refer to the warranty policy and procedures manual if a module is suspect.
B1A0098	Control Module	● Rear entertainment control module, component or system over-temperature	Check the module and circuits. Refer to the electrical guides. Clear the DTC and retest. Consider the atmospheric conditions before condemning a module.
B1D5079	Digital Disk Player	● Digital versatile disc (DVD) changer mechanical fault - Error report from AiNet	Check for a mechanical fault (jammed magazine, etc). Rectify as necessary.
B1D5093	Digital Disk Player	● Digital versatile disc (DVD) changer is not responding ● Communication error between the main and DVD microprocessors - No response from AiNet	Refer to the electrical guides and check the AiNet circuits. Rectify as necessary.
B1D5098	Digital Disk Player	● A high temperature condition has been detected	Check the installation of the DVD module. Make sure there is sufficient airflow. Clear the DTC and retest. Consider the atmospheric conditions before condemning a module.
B1D8193	Rear Left Display Module	● Left hand rear display is not responding ● Communication error between the main and left hand display microprocessors ● No response from the IS bus	Check the IS bus circuits. Refer to the electrical guides.
B1D8198	Rear Left Display Module	● A high temperature condition has been detected	Clear the DTC and retest. Consider the atmospheric conditions before condemning a module.
B1D8293	Rear Right Display Module	● Right hand rear display is not responding ● Communication error between the main and right hand display microprocessors ● No response from the IS bus	Check the IS bus circuits. Refer to the electrical guides.
B1D8298	Rear Right Display Module	● A high temperature condition has been detected	Clear the DTC and retest. Consider the atmospheric conditions before condemning a module.
B1D8393	Rear Centre Display Module	● Center rear display is not responding ● Communication error between the main and right hand display microprocessors ● No response from the IS bus	Check the IS bus circuits. Refer to the electrical guides.
B1D8398	Rear Centre Display Module	● A high temperature condition has been detected	Clear the DTC and retest. Consider the atmospheric conditions before condemning a module.
U1A0355	Car Config Parameter	● Rear entertainment module (REM) not configured	Configure the module using the approved diagnostic system.
U1A1731	Incomplete MOST Ring Reported By REM	● No signal from the rear entertainment module (REM) ● Fibre optic ring break condition reported	Carry out the general MOST test. Refer to the Network Communications section of the workshop manual and in the approved diagnostic system.
U1A334A	Lost Communication With ACM	● Lost communication with the audio front control module (ACM) - incorrect component installed - The security of the MOST network prevents the unauthorized addition of a	Configure the network to accept the module using the approved diagnostic system.

DTC	Description	Possible causes	Action
		module to the system	

Traffic Message Channel (TMC)

DTC	Description	Possible causes	Action
B1A004A	Control Module	● Traffic message channel (TMC) module - incorrect component installed (possibly wrong region)	Configure the system using the approved diagnostic system.
B1A5618	Antenna	● Traffic message channel (TMC) antenna circuit current below threshold	Refer to the electrical guides and check the antenna circuit. Refer to the electrical guides. Rectify as necessary.
B1A5619	Antenna	● Traffic message channel (TMC) antenna circuit current above threshold	Refer to the electrical guides and check the antenna circuit. Rectify as necessary.

Television Module (TVM)

DTC	Description	Possible causes	Action
B1A0016	Control Module	● Control module circuit voltage below threshold: - Voltage less than (master control module voltage - 2V) for > 10 seconds ● Battery voltage low ● Control module circuit High resistance	Check the battery condition and state of charge. Refer to the relevant section of the workshop manual. Check the module power and ground circuits. Refer to the electrical guides.
B1A0017	Control Module	● Control module circuit voltage above threshold ● Battery voltage high (overcharging) ● Control module circuit short circuit to power	Check the battery condition and state of charge. Refer to the relevant section of the workshop manual. Check the module power and ground circuits. Refer to the electrical guides.
B1A0048	Control Module	● Control module supervision software fault	Configure the module using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
B1A5611	Antenna	● Antenna circuit short circuit to ground	Refer to the electrical guides and check the antenna circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A5612	Antenna	● Antenna circuit short circuit to power	Refer to the electrical guides and check the antenna circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A5613	Antenna	● Antenna circuit high resistance	Refer to the electrical guides and check the antenna circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1D5511	Antenna #2	● Antenna 2 circuit short circuit to ground	Check the antenna and circuits. Refer to the electrical guides.
B1D5512	Antenna #2	● Antenna 2 circuit short circuit to power	Check the antenna and circuits. Refer to the electrical guides.
B1D5513	Antenna #2	● Antenna 2 circuit High resistance	Check the antenna and circuits. Refer to the electrical guides.
B1D5611	Antenna #3 Circuit	● Antenna 3 circuit short circuit to ground	Check the antenna and circuits. Refer to the electrical guides.
B1D5612	Antenna #3 Circuit	● Antenna 3 circuit short circuit to power	Check the antenna and circuits. Refer to the electrical guides.
B1D5613	Antenna #3 Circuit	● Antenna 3 circuit High resistance	Check the antenna and circuits. Refer to the electrical guides.
B1D5711	Antenna #4 Circuit	● Antenna 4 circuit short circuit to ground	Check the antenna and circuits. Refer to the electrical guides.

DTC	Description	Possible causes	Action
B1D5712	Antenna #4 Circuit	- Antenna 4 circuit short circuit to power	Check the antenna and circuits. Refer to the electrical guides.
B1D5713	Antenna #4 Circuit	- Antenna 4 circuit High resistance	Check the antenna and circuits. Refer to the electrical guides.
B1D5811	Television Output	- Television output circuit short circuit to ground	Check the television output circuits. Refer to the electrical guides.
B1D5812	Television Output	- Television output circuit short circuit to power	Check the television output circuits. Refer to the electrical guides.
B1D5813	Television Output	- Television output circuit High resistance	Check the television output circuits. Refer to the electrical guides.
U1A2087	Incomplete MOST Ring Reported By TVM	- No signal from the TV module (TVM) - Fibre optic ring break condition reported	Carry out the general MOST test. Refer to the Network Communications section of the workshop manual and in the approved diagnostic system.

Common DTCs

DTC	Description	Possible causes	Action
B1A0049	Control Module	- Amplifier internal electrical failure (can be set in more than one module) - Touch screen display (TSD) internal electrical failure (can be set in more than one module)	Check the power and ground circuits to the module. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
U1A0362	Car Config Parameter	- Signal compare failure	Configure the module using the approved diagnostic system.
U300004	Control Module	- Audio unit internal failure - no communications with CD module	Check the power and ground circuits to the component. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
U30004A	Control Module	- Audio unit control module: Incorrect component installed - The security of the MOST network prevents the unauthorized addition of a module to the system. Car Configuration file does not have the 'SRM Installed' parameter set, but the module is installed to vehicle.	Configure the network to accept the module using the approved diagnostic system.
U300055	Control Module	- Audio unit not configured - Can also be set by a harness fault - EQ Setting not equal to car information of IHU	Configure the module using the approved diagnostic system.
U300068	Control Module	- Audio unit event information - MOST transceiver overheating	Refer to the electrical guides and check the power and ground circuits to the component. Check the MOST circuit. Carry out the general MOST test. Refer to the Network Communications section of the workshop manual and in the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.

Satellite Digital Audio Radio Service (SDARS) diagnosis

Overview

The following information is intended to aid in the diagnosis of basic faults with the satellite radio system.

The diagnostic trouble codes are the main source of information in diagnosing other than basic faults.

There are five conditions which may affect the available channels:

A: No signal available

The signal is not reaching the module.

The vehicle must have clear line of sight to a satellite, which means being outside and having no blockages between the vehicle and the satellite.

• NOTE: If the vehicle is outside America, this is the only condition which will be possible.

B: More than 6 months without subscribing

There is a 6 month free period of channel 184 being broadcast to allow testing of the system.

After this period, no channels can be received, and an **unsubscribed** message will be displayed.

C: Less than 6 months without subscribing

This will allow the vehicle to receive channel 184 only, all other channels will display **unsubscribed**.

D: Subscribed to the family package

All channels should be audible, but adult content channels will be blocked, and the message **unsubscribed** will be shown on these channels.

E: Subscribed to the full package

All channels should be available, with the exception of some pay channels.

In this case, the message **unsubscribed** will be shown on these channels.

System testing

Tune to channel 184 (this is usually the default channel for all presets).

Select the direct channel input feature by pressing the "#" key.

This will allow the audio to be routed to the speakers if condition C, D or E exist.

If condition B exists, a subscription will have to be made.

1. **1.** Are other systems affected?
    - The most common symptom would be the loss of audio from other entertainment features, although the display sticking on the logo screen is a good indicator of a MOST issue.
    - If other systems **are** affected, check the entertainment circuits for loose or broken connectors, etc. Refer to the electrical guides.
2. **2.** If only the satellite radio system is affected, retrieve the DTCs from the module using the approved diagnostic system or a scan tool.
    - Refer to the DTC index above

Quick guide

Display	Symptom	Possible causes	Notes/Action
No signal or **Acquiring signal**	No channels available	• Antenna connections	Check for DTCs. Check the connections from the module to the antenna and the antenna to the harness. Rectify as necessary.
	No audio	• MOST connection	Check for DTCs. Check the function of other audio system components. Check the connections to other MOST components.
Unsubscribed	No channels available	• The free period has expired	Carry out the checks above.
Weather/Emergency	No audio on CD or other component	• Other audio component may be faulty	Check for DTCs. Check the function of other audio system components.

Satellite Radio Module (SDARS)

DTC	Description	Possible Cause	Action
B1A5614	Antenna	• Terrestrial radio antenna circuit short circuit to ground • Antenna circuit high resistance	Refer to the electrical guides and check the antenna circuit. Check the co-axial cable and connectors for damage, etc. Rectify as necessary.
B1A8911	Satellite antenna	• Circuit short to ground. The SDARS module has detected a ground measurement for a period longer than expected or	Carry out any diagnostic pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check SDARS antenna cable for short to ground. Install SDARS antenna harness as required. Suspect the

DTC	Description	Possible Cause	Action
		has detected a ground measurement when another value was expected - SDARS antenna cable short to ground - Internal failure SDARS module - Internal failure SDARS antenna	SDARS module, check and install a new SDARS module as required. Suspect the SDARS antenna, check and install a new SDARS antenna as required. Refer to the new module/component installation note at the top of the DTC Index.
B1A8912	Satellite antenna	- Circuit short to battery. The SDARS module has detected a vehicle power measurement for a period longer than expected, or has detected a vehicle power measurement when another value was expected - SDARS antenna cable short to power - Internal failure SDARS module - Internal failure SDARS antenna	Carry out any diagnostic pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check SDARS antenna cable for short to power. Install SDARS antenna harness as required. Suspect the SDARS module, check and install a new SDARS module as required. Suspect the SDARS antenna, check and install a new SDARS antenna as required. Refer to the new module/component installation note at the top of the DTC Index.
B1A8913	Satellite antenna	- Circuit open. The SDARS module has determined an open circuit via lack of bias voltage, low current flow, no change in the state of an input in response to an output - SDARS antenna cable open circuit - Internal failure SDARS module - Internal failure SDARS antenna	Carry out any diagnostic pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check SDARS antenna cable for open circuit. Install SDARS antenna harness as required. Suspect the SDARS module, check and install a new SDARS module as required. Suspect the SDARS antenna, check and install a new SDARS antenna as required. Refer to the new module/component installation note at the top of the DTC Index.
U300004	Control module	- SDARS module. System internal failure	Suspect the SDARS module, check and install a new SDARS module as required, refer to the new module/component installation note at the top of the DTC Index.
U30004A	Control module	- SDARS module. Incorrect component installed - Car configuration mismatch	Using the manufacturer approved diagnostic system select the vehicle configuration Main Menu, vehicle configuration, display and or modify the vehicle configuration file data. Check update as required.
U300055	Control module	- SDARS module, not configured - Incorrect car configuration file data received	Using the manufacturer approved diagnostic system select the vehicle configuration main menu, select configure existing modules menu and programme the SDARS module.

High Definition Tuner Module (HDR)

DTC	Description	Possible Cause	Action
B1A8902	Satellite antenna	- General signal failure - HD coax antenna cable short to ground, short to power, open circuit - Internal failure high definition tuner module - Internal failure AM/FM diversity antenna amplifier	Carry out any diagnostic pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check HD coax antenna cable for short to ground, short to power, open circuit. Install HD coax cable as required. Suspect the high definition tuner module, check and install a new high definition tuner module as required. Suspect the high AM/FM diversity antenna amplifier, check and install a new AM/FM diversity antenna amplifier as required. Refer to the new module/component installation note at the top of the DTC Index.
B1A8911	Satellite antenna	- Circuit short to ground. The high definition tuner module has detected a ground measurement for a period longer than expected or has detected a ground measurement when another value was expected - HD coax antenna cable short to ground - Internal failure high definition tuner module - Internal failure AM/FM	Carry out any diagnostic pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check HD coax antenna cable for short to ground. Install HD coax cable as required. Suspect the high definition tuner module, check and install a new high definition tuner module as required. Suspect the high AM/FM diversity antenna amplifier, check and install a new AM/FM diversity antenna amplifier as required. Refer to the new module/component installation note at the top of the DTC Index.

DTC	Description	Possible Cause	Action
		diversity antenna amplifier	
B1A8912	Satellite antenna	● Circuit short to battery. The high definition tuner module has detected a vehicle power measurement for a period longer than expected, or has detected a vehicle power measurement when another value was expected ● HD coax antenna cable short to power ● Internal failure high definition tuner module ● Internal failure AM/FM diversity antenna amplifier	Carry out any diagnostic pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check HD coax antenna cable for short to power. Install HD coax cable as required. Suspect the high definition tuner module, check and install a new high definition tuner module as required. Suspect the high AM/FM diversity antenna amplifier, check and install a new AM/FM diversity antenna amplifier as required. Refer to the new module/component installation note at the top of the DTC Index.
B1A8913	Satellite antenna	● Circuit open. The high definition tuner module has determined an open circuit via lack of bias voltage, low current flow, no change in the state of an input in response to an output ● HD coax antenna cable open circuit ● Internal failure high definition tuner module ● Internal failure AM/FM diversity antenna amplifier	Carry out any diagnostic pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check HD coax antenna cable for open circuit. Install HD coax cable as required. Suspect the high definition tuner module, check and install a new high definition tuner module as required. Suspect the high AM/FM diversity antenna amplifier, check and install a new AM/FM diversity antenna amplifier as required. Refer to the new module/component installation note at the top of the DTC Index.
U200D14	Control module output power A	● Circuit short to ground or open ● Div power circuit short to ground, open circuit ● Internal failure high definition tuner module ● Internal failure AM/FM diversity antenna amplifier	Carry out any diagnostic pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check div power circuit for short to ground, open circuit. Repair as required. Suspect the high definition tuner module, check and install a new high definition tuner module as required. Suspect the high AM/FM diversity antenna amplifier, check and install a new AM/FM diversity antenna amplifier as required. Refer to the new module/component installation note at the top of the DTC Index.
U300004	Control module	● High definition tuner module. System internal failure	Suspect the high definition tuner module, check and install a new high definition tuner module as required, refer to the new module/component installation note at the top of the DTC Index.
U30004A	Control module	● High definition tuner module. Incorrect component installed ● Car configuration mismatch	Using the manufacturer approved diagnostic system select the vehicle configuration Main Menu, vehicle configuration, display and or modify the vehicle configuration file data. Check update as required.
U300055	Control module	● High definition tuner module, not configured ● Incorrect car configuration file data received	Using the manufacturer approved diagnostic system select the vehicle configuration main menu, select configure existing modules menu and programme the high definition tuner module.
U300087	Control module	● Missing message. The high definition tuner module has not received one or more expected messages. ● Local configuration file incorrect ● Local configuration file parameter is missing, out of range or invalid checksum ● Internal failure high definition tuner module	Using the manufacturer approved diagnostic system select the vehicle configuration main menu, select configure new modules menu and programme the high definition tuner module. Refer to the new module/component installation note at the top of the DTC Index.
U300098	Control module	● High definition tuner module component or system over temperature	Check high definition tuner module and location for causes of excessive temperature, rectify as required. Suspect the high definition tuner module, check and install a new high definition

DTC	Description	Possible Cause	Action
		- Internal failure high definition tuner module	tuner module as required. Refer to the new module/component installation note at the top of the DTC Index.

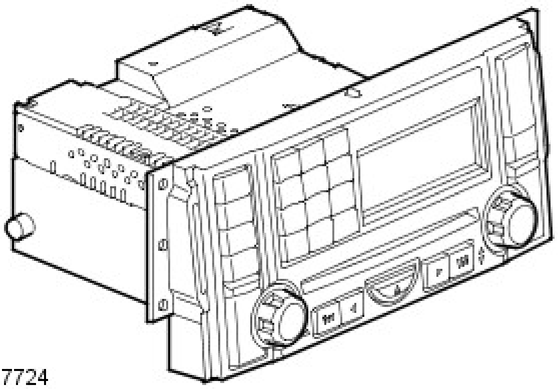
INTEGRATED HEAD UNIT



E47724

• NOTE: The base level audio system IHU comprises a single disc compact disc (CD) player and an integral amplifier, all other functions of the unit are comparable with the 6 disc unit.

The audio system is based around an Integrated Head Unit (IHU) which communicates on the Media Orientated System Transport (MOST) ring and the medium speed controller area network (CAN) bus.

The IHU contains the following functionality:

- Radio tuner.
- CD player (Six disc in dash changer).
- Integrated telephone control.
- Auxiliary input (for any device featuring a 3.5mm jack plug output).

The IHU (Integrated Head Unit) unit also integrates with the navigation system, this requires the addition of a navigation computer, touch screen display and GPS antenna.

The IHU is woken up by CAN bus activity and is not woken up from the ignition aux position.

The IHU is the Bus Master for the MOST system and contains the timing master for the MOST system.

Tuner

The IHU incorporates a AM/FM tuner which allows for 18 FMpre-sets and 18 AM (9 MW and 9 LW) pre-set stations to be stored in the IHU memory. The radio tuner also incorporates the following radio functions:

- Auto tune
- Traffic announcements (TA)
- radio data system (RDS) EON function
- Seek station
- Tune up/down
- Scan
- PTY

CD Player

The CD player is a 6 disc in dash mounted device. The CD multi changer is capable of playing commercial CDs, CDRs, CDRWs and MP3 discs.

Random Play

The Random feature only works on the CD, which has been selected. The Random feature plays all the tracks on the selected CD in a random order. All the tracks on that disc will be played before a new random sequence is played. If a new CD is selected while in random mode, the random mode will be cancelled and play will commence from track 1.

Repeat

The Repeat feature allows the current track to be repeated in an endless loop, when selected by the user.

MP3

The CD player has the capability to play MP3 files. The MP3 discs follow a format of folders and files within the folder. It is also possible to place all the files in the root directory on the CD.

The random and repeat features follow the normal CD random and repeat feature functions.

Scan

Scan allows the user to play the first 10 seconds of each track on the CD in the unit.

Automatic Volume Control - AVC

The AVC feature is designed to adjust output volume to compensate for the rising level noise of the vehicle as the vehicle travels faster.

There are 10 settings for AVC, where 0 = off, 1 is the lowest setting (minimum volume change with speed and 9 the maximum).

The vehicle speed signal is used to enable the IHU to calculate the volume adjustment required. The vehicle speed signal is received over the CAN. The signal is an average of the four wheel speed sensor signals.

Control of the AVC is carried out by the audio amplifier.

Should an invalid speed signal be received the AVC will not alter the output volume.

CLOCK

The IHU contains the master clock functionality. The IHU contains and displays the clock in one unit. Other vehicle modules that require clock functionality use the time supplied from the IHU.

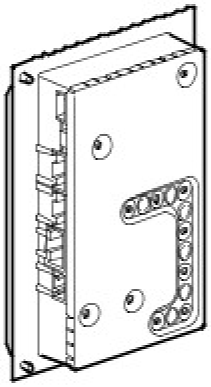
The clock is available to any control module that is connected to an interconnecting bus i.e. either of the CAN busses or the MOST ring.

The clock display configurable to show in AM / PM or 24 hour format. Midnight is shown as 12:00AM or 0:00 respectively. The default condition, if not specified, after power on or delivery, should default to 1:00PM or 13:00. Depending upon the market set the clock will default to either 12 or 24 hour format.

The time is adjusted from the IHU. Under conditions when any bus could be asleep or shut down, the HMI does not allow clock adjustments.

AMPLIFIERS

Harman Kardon High Line/Logic 7 Amplifier



E47726

The audio system has three amplification options dependant on the audio system specified:

- Internal amplifier
- Harman kardon
- Harman kardon LOGIC 7

The amplifier is located under the RH front seat and is connected to the audio system via the MOST bus. Speaker connections are hardwired.

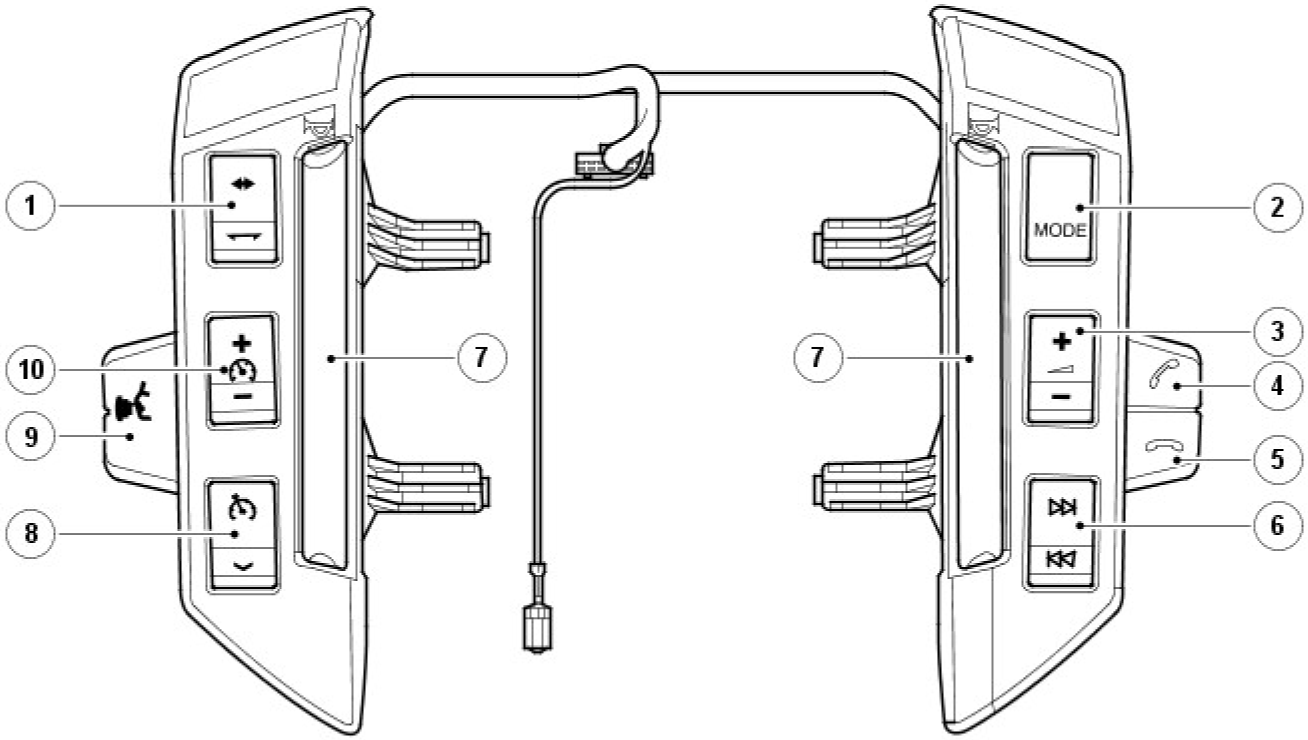
Steering Wheel Control Switches



E58417

Item	Part Number	Description
1	-	Adaptive speed control gap adjustment switches
2	-	Audio mode change switch
3	-	Audio volume control
4	-	Send key
5	-	End key
6	-	Audio system up/down
7	-	Horn
8	-	Speed control ON/OFF/ set speed
9	-	Push to talk voice recognition switch
10	-	Speed control set speed adjust

The IHU can be remotely controlled via steering wheel mounted controls. The audio steering wheel controls are mounted to the RH side of the steering wheel with the voice recognition system control (push to talk switch) located on the LH side of the steering wheel behind the speed control switches.

The Steering wheel control switches allow the driver to:

- Change audio system mode
- Adjust audio volume
- Change CD tracks
- Activate the voice recognition system
- Change radio pre-sets
- Tune up/down
- Answer and end a phone call (where a phone is fitted)
- Use the voice recognition system.

The switches operate on a resistive ladder principle. A voltage is supplied to the switches and dependant upon which button is pressed a reduced voltage is returned to the head unit.

SATELLITE DIGITAL AUDIO RADIO SERVICE (SDARS NAS only)

The SDARS systems operate in the S-Band frequency range (2.3 GHz) and, as a result of the use of satellite transmission have the ability to provide CD quality audio broadcasts over very large areas (typically continents). SDARS service providers transmit a signal from their up-link facility (which is the original point of transmission of data, voice or other information through an antenna system) to a satellite where the signal is then down linked to both the terrestrial repeater network and the individual SDARS car radios. The radio switches between the satellite signal and the repeater signal depending on the strength of the signal at any given time.

Land Rover will be using the Sirius Satellite Radio service provider in the USA.

The Sirius SDARS systems comprise:

- Satellites
- Ground repeaters
- Up-link ground stations
- Radio receiver systems

The Sirius SDARS system uses three satellites on an inclined elliptical orbit. This ensures that each satellite spends approximately 16 hours a day over the continent of the USA, with at least one satellite over the country at any one time.

The satellites beam their signals down to the ground where the signal is picked up by receivers or is transmitted to repeater stations to cover built up areas where the signal is obscured.

TRAFFIC MESSAGE CHANNEL (TMC)

The TMC system is a European only system whereby traffic information is received by the TMC tuner and used by the navigation computer to recalculate the route being used to avoid the traffic disruption. This system information is broadcast on the RDS data carriers.

The information is used by the navigation system to avoid traffic disruptions on a planned route
For additional information, refer to: Navigation System (419-07 Navigation System, Description and Operation).

Audio Unit - Audio Unit

Removal and Installation

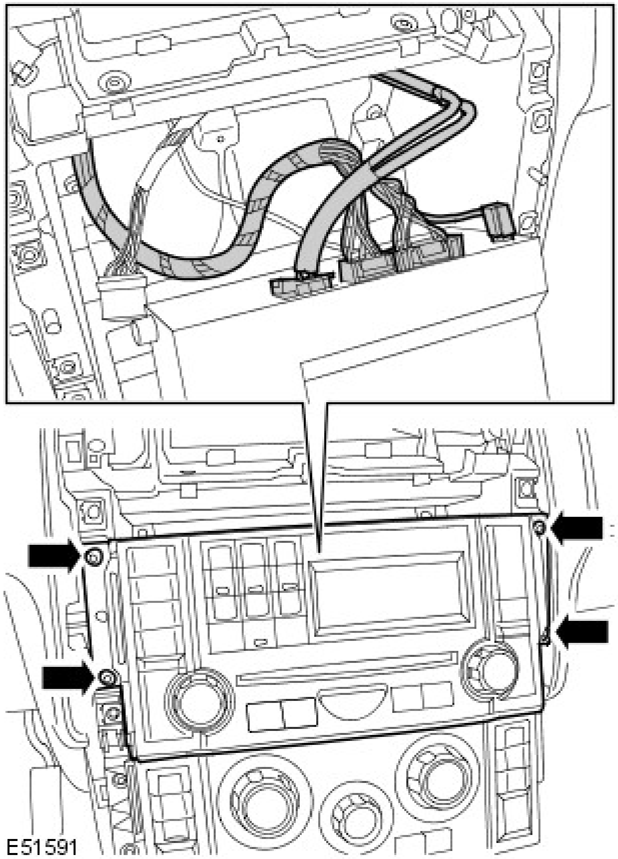
Removal

⚠ CAUTION: A new audio unit is supplied with a transit plate installed. The transit plate must be removed, before installing the audio unit.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the floor console upper panel.
For additional information, refer to: Floor Console Upper Panel (501-12 Instrument Panel and Console, Removal and Installation).

3. Remove the instrument panel console switch pack.
For additional information, refer to: Instrument Panel Console Switch Assembly (501-12 Instrument Panel and Console, Removal and Installation).



4. Remove the audio unit.

- Remove the 4 Torx screws.
- Disconnect the 2 electrical connectors.
- Disconnect the fibre optic connector.
- Disconnect the antenna cable.

Installation

1. ⚠ CAUTION: A new audio unit is supplied with a transit plate installed. The transit plate must be removed, before installing the audio unit.

• NOTE: This unit does not require configuring using diagnostic equipment.

Install the audio unit.

- Attach the antenna cable.

- Connect the fibre optic connector.
- Connect the electrical connectors.
- Tighten the Torx screws.

2. Install the instrument panel console switch assembly.
   For additional information, refer to: Instrument Panel Console Switch Assembly (501-12 Instrument Panel and Console, Removal and Installation).
3. Install the floor console upper panel.
   For additional information, refer to: Floor Console Upper Panel (501-12 Instrument Panel and Console, Removal and Installation).
4. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

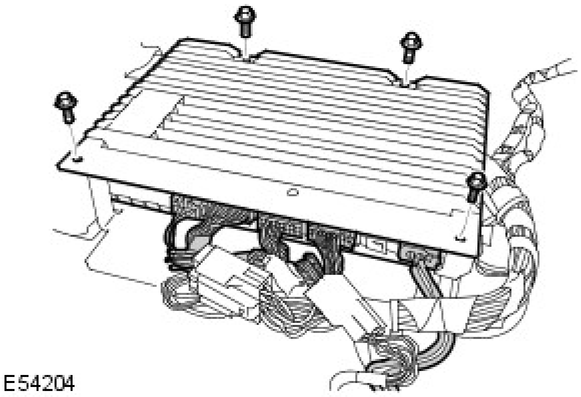
Published: 11-May-2011

Audio Unit - Audio Amplifier

Removal and Installation

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the RH front seat.
   For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).
3. ⚠ CAUTION: Cover fiber optic cable connectors to minimize dust ingress and avoid bending the cables in a radius of less than 30 mm.



Remove the amplifier.

- Remove the 4 bolts.
- Disconnect the 5 electrical connectors.

Installation

1. Install the amplifier.
   - Install the bolts and tighten to 10 Nm (7 lb.ft).
   - Connect and secure the electrical connectors.
2. Install the front seat.
   For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).
3. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
4. Using the Land Rover approved diagnostic equipment, follow the on-screen instructions and configure the audio unit amplifier.

Audio Unit - Audio Unit Fascia

Removal and Installation

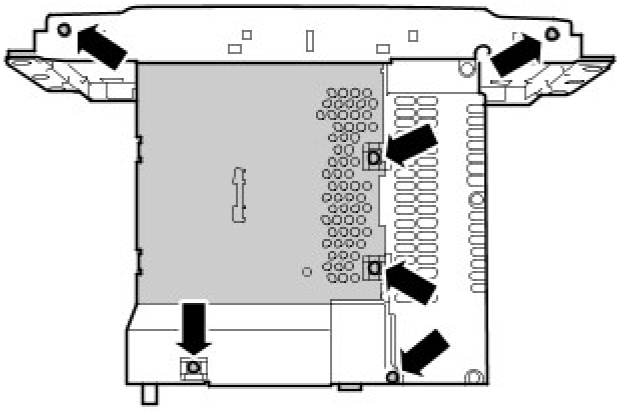
Removal

1. Remove the audio unit (integrated head unit) assembly.
For additional information, refer to: Audio Unit (415-01 Audio Unit, Removal and Installation).

2. ⚠ CAUTION: Make sure that the area around the component is clean and free of foreign material.

Remove the audio unit upper trim panel.

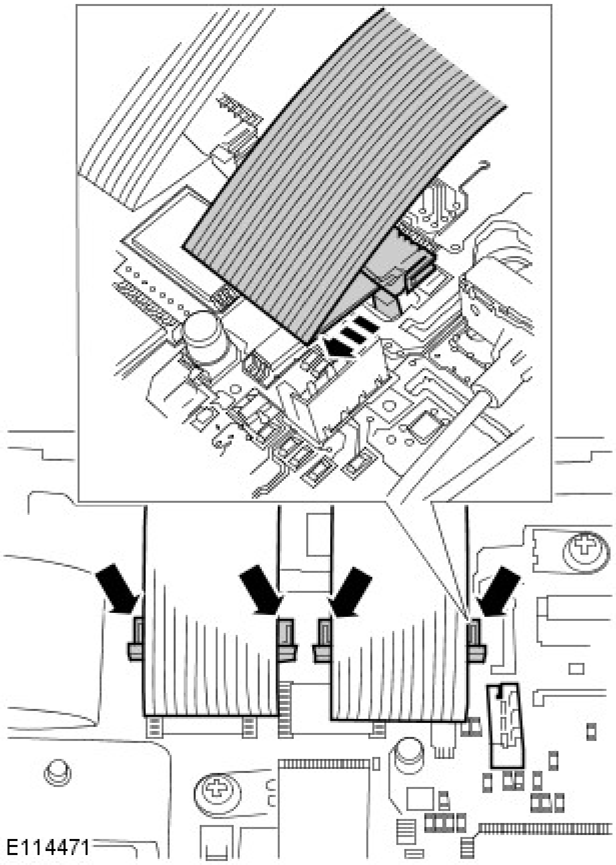
- Remove the 6 screws.



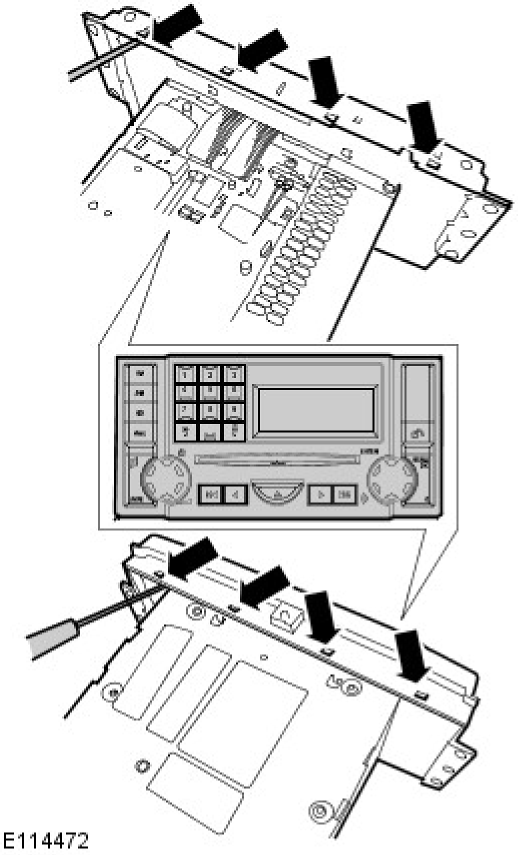
E114470

3. Remove the 2 PCB (printed circuit board) ribbons from the main PCB.

- Using a suitable plastic tool, carefully release the 4 clips from each side of the 2 connectors.

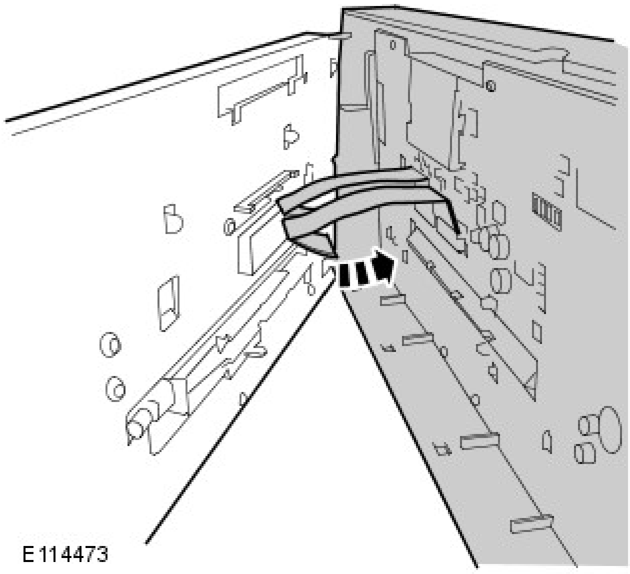


E114471



4. Displace the audio unit fascia.

- Using a suitable tool, carefully release the 8 clips.



5. CAUTIONS:

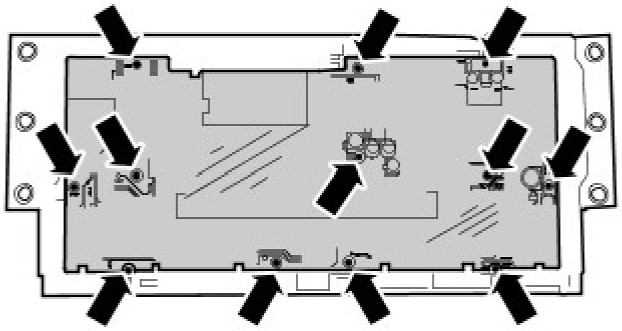
⚠ Make sure ribbons are not damaged when removing the fascia panel.

⚠ Care should be taken to prevent damage to fascia panel front face.

Remove the audio unit fascia from the main IHU body.

6. Remove the PCB from the audio unit fascia.

- Remove the 12 screws.



E114474

Installation

1. ⚠CAUTION: Care should be taken to prevent damage to fascia panel front face.

Install the PCB to the new audio unit fascia.

- Install the 12 screws.

2. ⚠CAUTION: Make sure ribbons are not damaged when installing the fascia panel.

Install the audio unit fascia.

- Carefully feed the ribbons through the audio unit casing.
- Push the audio unit fascia to the IHU main body and make sure the audio unit fascia is secured with the 8 clips.

3. ⚠CAUTION: make sure the ribbon cables are correctly inserted or the IHU will not function properly.

Install the 2 PCB ribbons to the main PCB.

- Insert the 2 ribbons to the connectors on the main PCB.
- Using a suitable plastic tool, carefully secure the 4 clips.

4. Install the audio unit upper trim panel.

- Install the 6 screws.

5. Install the audio unit (integrated head unit) assembly.
For additional information, refer to: Audio Unit (415-01 Audio Unit, Removal and Installation).

4	-	TV antenna amplifier
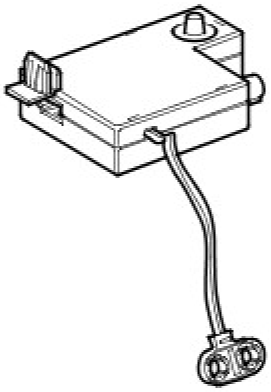
5	-	FM diversity antenna amplifier
6	-	TV antenna amplifier
7	-	TV antenna amplifier
8	-	FM antenna amplifier
9	-	VICS/TMC antenna amplifier

The antenna systems fitted to the vehicle comprise:

- amplitude modulation (AM) (glass mounted)
- FM (glass mounted)
- FM diversity (glass mounted, where fitted)
- TV (glass mounted, where fitted)
- Multiband telephone antenna (roof mounted, where fitted)
- global positioning system (GPS) antenna (roof mounted, where fitted)
- SDARS (roof mounted NAS only)
- VICS antenna and beacon antenna (Japan only where fitted)

FM ANTENNAS

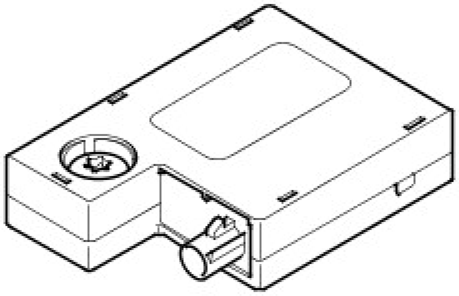
FM Antenna Amplifier



E48084

The AM/FM antennas are located in the rear side widows. On vehicles with the low line audio system the AM/FM antenna is located in the LH side screen. On vehicles with a high line audio system the audio system will be equipped with FM diversity tuning. This system ensures that the strongest of two signals is used by the radio system to ensure the best possible FM reception. The standard AM/FM antenna is screen mounted in the LH rear side window and is connected to an antenna amplifier located above the screen. The diversity system uses the same side window antenna and amplifier but also uses RH side screen.

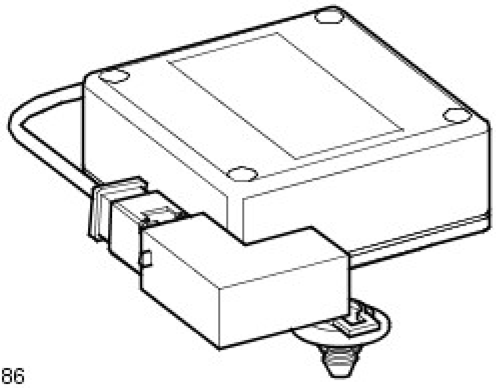
TMC ANTENNA AMPLIFIER



E48087

The Traffic Message Channel (TMC) signals are received through the normal radio signals via the RDS network. The signals are routed separately form the radio signals via a separate antenna amplifier located on the LH rear side window.
For additional information, refer to: Navigation System (419-07 Navigation System, Description and Operation).

GPS ANTENNA

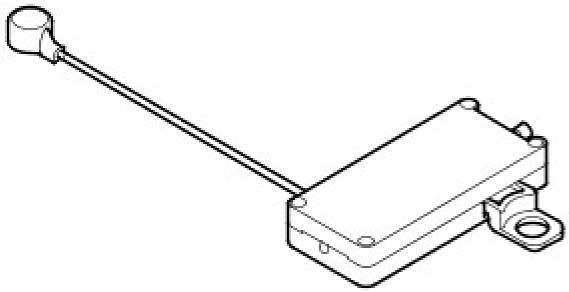


E48086

The GPS antenna is located in the roof mounted pod, which is located in the center of the roof at the rear of the vehicle. The GPS antenna is connected to the navigation computer by a coaxial cable.
For additional information, refer to: Navigation System (419-07 Navigation System, Description and Operation).

TV ANTENNA

TV Antenna Amplifier



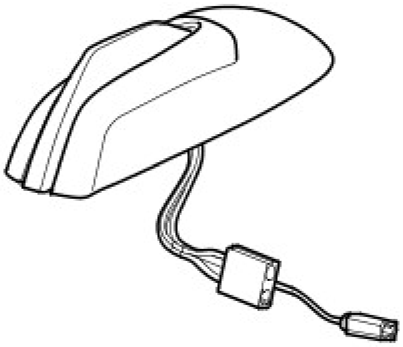
E48088

Where a television system is specified there are four TV antenna elements two in each of the rear side windows. Each element has an antenna amplifier which is connected to the TV tuner module by a coaxial cable.
For additional information, refer to: Video System (415-07 Video System, Description and Operation).

The TV RF antenna amplifiers are located just above the rear quarter light, behind the trim. The four TV antenna amplifiers boost the received RF signal before it is collected and processed by the TV tuner. The TV antennae can receive RF signals of between 48 and 860 MHz.

MULTIBAND TELEPHONE ANTENNA

Multiband Telephone Antenna

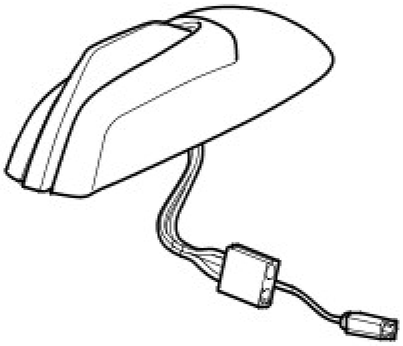


E48085

The multiband telephone antenna is located in the roof mounted pod, which is located in the center of the roof at the rear of the vehicle and is connected directly to the Telephone Control Module (TCM) via a single coaxial cable.
For additional information, refer to: Cellular Phone (419-08 Cellular Phone, Description and Operation).

SATELLITE DIGITAL AUDIO RADIO SYSTEM (SDARS) ANTENNA (NAS ONLY)

SDARS antenna



E48085

The SDARS antenna is located in the roof mounted pod, which is located in the center of the roof at the rear of the vehicle. The SDARS antenna has two connections to the SDARS tuner, one for satellite transmissions the other for terrestrial transmissions from repeater stations.

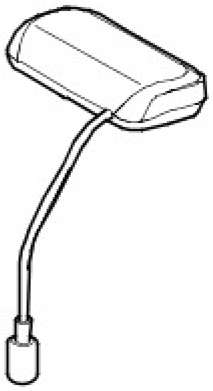
The antenna comprises two antenna elements:

- A printed dipole antenna for receiving satellite signals
- A printed monopole antenna for receiving terrestrial signals

The two antennas allow the system to receive SDARS transmissions in built up areas where signals form satellites would normally be blocked.
For additional information, refer to: Audio System (415-01 Audio Unit, Description and Operation).

VICS ANTENNAS (Japan only)

VICS Beacon Antenna



E48091

The VICS control module uses the rear RH side window antenna to receive VICS information. The Control module also uses an infra red beacon antenna located in the middle on top of the instrument panel adjacent to the sunlight sensor.

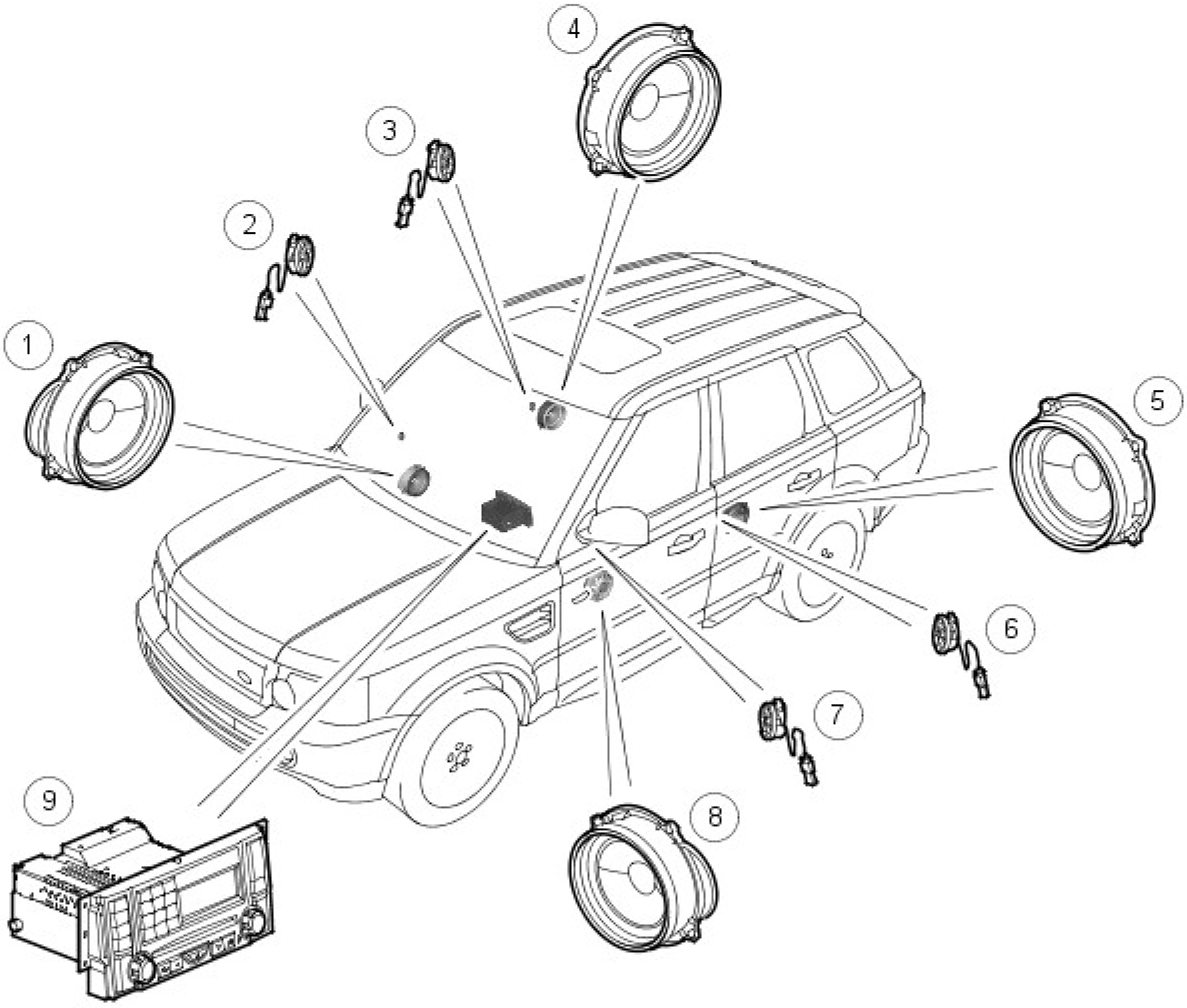
Speakers - Speakers

Description and Operation

The speaker configuration depends on the level of audio and head unit fitted to the vehicle. The following details the speaker configuration and control for each system.

LOW LINE AUDIO SYSTEM

Low Line Audio System Speaker Component Location



E56921

Item	Part Number	Description
1	-	Front right-hand (RH) door mid/bass speaker
2	-	Front RH door tweeter
3	-	Rear RH door tweeter
4	-	Rear RH door full range speaker
5	-	Rear left-hand (LH) door full range speaker
6	-	Rear LH door tweeter

7	-	Front LH door tweeter
8	-	Front LH door mid/bass speaker
9	-	Integrated Head unit (IHU)

Low Line Audio System Speaker Control Diagram

Item	Part Number	Description
1	-	Front LH tweeter
2	-	Integrated Head Unit (IHU)
3	-	Front RH tweeter
4	-	Front RH mid/bass speaker
5	-	Rear RH full range speaker
6	-	Rear RH tweeter
7	-	Rear LH tweeter
8	-	Rear LH full range speaker
9	-	Front LH mid/bass speaker

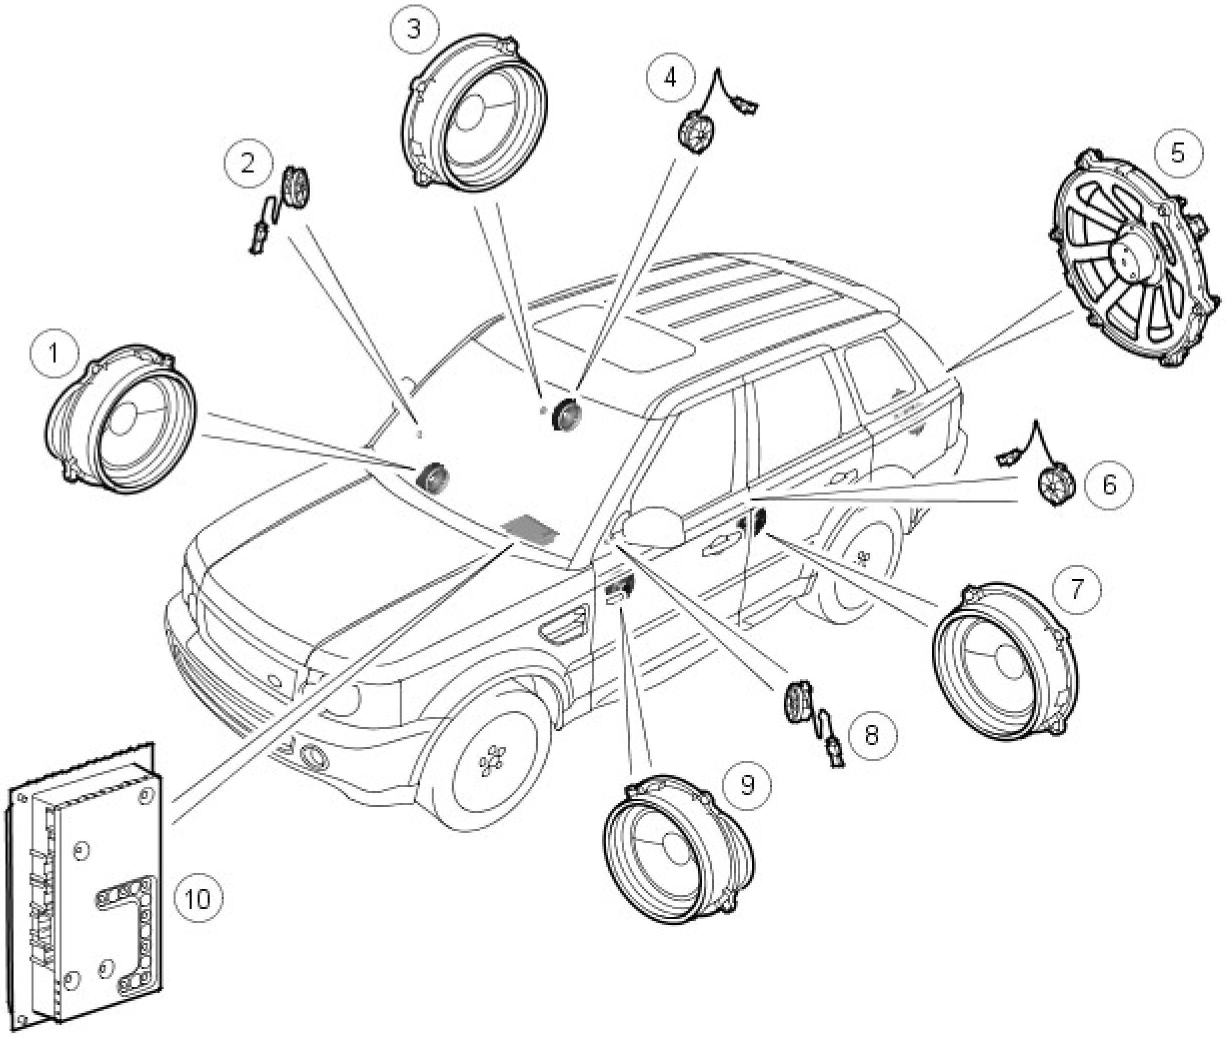
The low line audio speaker system is driven directly from the Integrated Head Unit (IHU)

For additional information, refer to: Audio System (415-01 Audio Unit, Description and Operation).
.The system comprises:

- Head unit
- Two front door mounted mid/bass speakers (one per side)
- Two front door mounted tweeters (one per side)
- Two rear door mounted full range speakers (one per side).

HIGH LINE-HARMAN/KARDON AUDIO SYSTEM

High line-Harman/Kardon Audio System Speaker Component Location



E56923

Item	Part Number	Description
1	-	Front RH mid/bass speaker
2	-	Front RH tweeter
3	-	Rear RH mid/bass range
4	-	Rear RH tweeter
5	-	Sub-woofer
6	-	Rear LH tweeter

7	-	Rear LH mid/bass range
8	-	Front LH tweeter
9	-	Front LH mid/bass speaker
10	-	High line amplifier

7	-	Sub-woofer
8	-	Rear LH mid/bass speaker
9	-	Rear LH tweeter

10	-	Front LH mid/bass speaker

The High line-Harman/Kardon audio speaker system is driven by an amplifier located under the RH front seat. The amplifier is controlled by the Integrated Head Unit (IHU) on the MOST bus and supplies 6x50 Watts output, giving a total system power rating of 300 Watts
For additional information, refer to: Audio System (415-01 Audio Unit, Description and Operation).
. The system comprises:

- Integrated Head Unit (IHU) Head unit
- Two front door mounted mid/bass range speakers (one per side)
- Two front door mounted tweeters (one per side)
- Two rear door mounted mid/bass range speakers (one per side)
- Two rear door mounted tweeters (one per side)
- A sub-woofer located in the lower tailgate
- An audio amplifier located under the front RH seat.

PREMIUM AUDIO SYSTEM - HARMAN/KARDON LOGIC7

The Premium Audio - Harman/Kardon LOGIC7 audio speaker system is driven by an amplifier located under the RH front seat. The amplifier is controlled by the Integrated Head Unit (IHU) on the MOST bus and supplies 12x50 Watts output, giving a total system power rating of 600 Watts. The system comprises:

- Integrated Head Unit (IHU) Head unit
- Two front door mounted mid range speakers (one per side)
- Two front door mounted bass speakers (one per side)
- Two front door mounted tweeters (one per side)
- Two rear door mounted mid/bass range speakers (one per side)
- Two rear door mounted tweeters (one per side)
- A sub-woofer located in the lower tailgate
- Two rear surround speakers
- One center fill speaker located in the center of the instrument panel
- Premium amplifier.

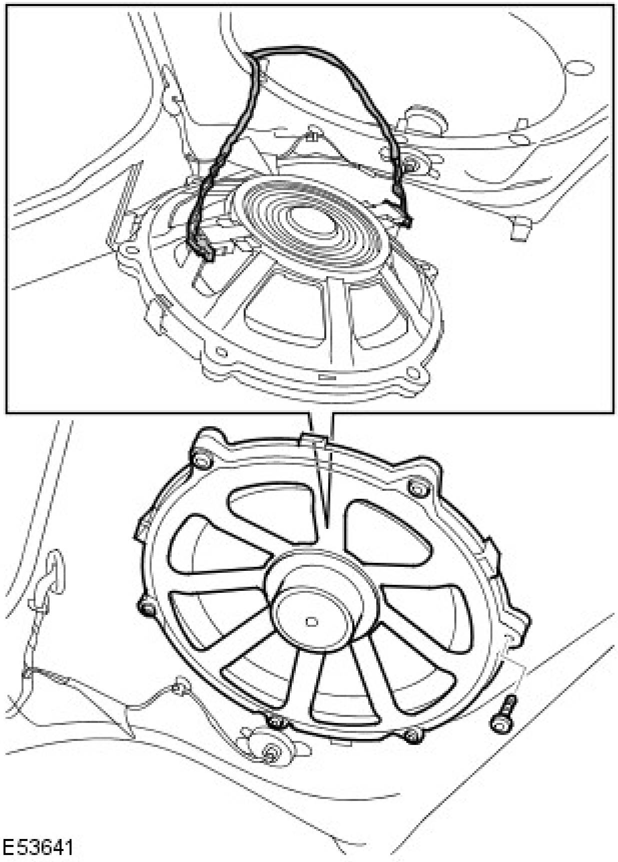
Removal and Installation

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the liftgate lower trim panel.
   For additional information, refer to: Liftgate Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Remove the subwoofer.
   - Remove the 6 screws.
   - Disconnect the 2 electrical connectors.



Installation

1. Install the subwoofer.
   - Connect and secure the electrical connectors.
   - Install the screws.
2. Install the liftgate lower trim panel.
   For additional information, refer to: Liftgate Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

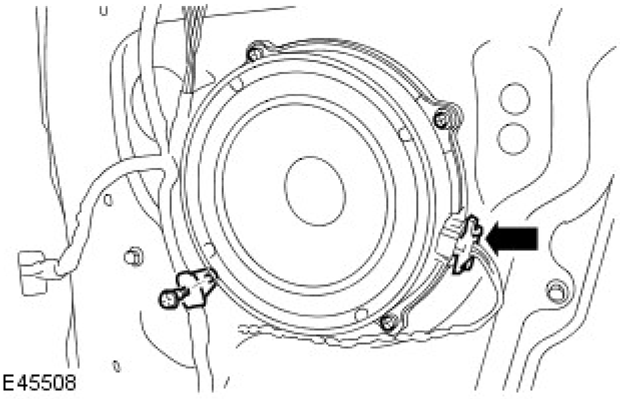
Removal and Installation

Removal

1. Remove the front door trim panel.
   For additional information, refer to: Front Door Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).



2. Remove the speaker.
   - Disconnect the electrical connector.
   - Remove the 4 screws.

Installation

1. Install the speaker
   - Align the door wiring harness clip.
   - Tighten the screws.
   - Connect the electrical connector.

2. Install the front door trim panel.
   For additional information, refer to: Front Door Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

13	-	Rear door remote audio controls/headphone socket and window switch
14	-	Rear door remote audio controls/headphone socket and window switch
17	-	AVIO panel
18	-	Fuse

The Video system comprises:

- Front screen (TAD)
- Television tuner module
- Television antennas
- Rear remote control headphone modules

The Rear Seat Entertainment (RSE) system comprises:

- RSE control module
- RSE infrared remote control
- RSE roof mounted screen
- DVD multi changer
- AV input panel.

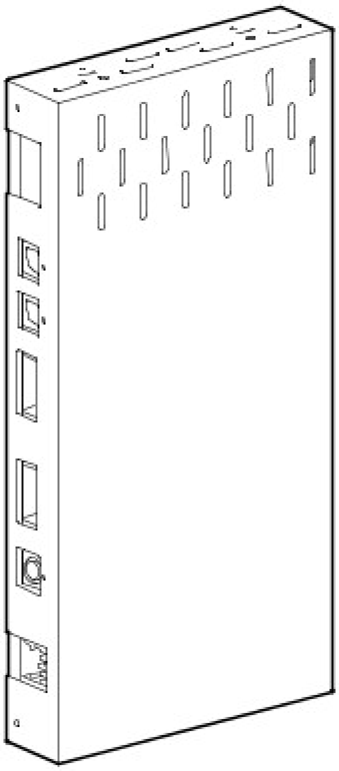
The rear multimedia system provides video and audio entertainment for the rear seat occupants. The system allows rear seat occupants to:

- Play video DVD, video compact disc (CD) and audio CD's stored in the DVD player.
- View the Television (TV) output selected on the Touch Screen Display (TAD) unit (with the vehicle moving up to 5 kph).

Video and TV pictures are viewed on liquid crystal display (LCD) screens located in the back of the front seat head restraints. The audio output can be played through headphones or over the vehicle audio system speakers.

REAR SEAT ENTERTAINMENT MODULE

RSE Module



M866142

The Rear Seat Entertainment (RSE) module is located in the rear RH side of the luggage compartment. The RSE module interfaces between the audio and video inputs from other systems components and the video display and audio outputs.

The RSE module communicates with the audio systems via a MOST connection. Audio output from the DVD autochanger and the AVIO panel is processed by the module and passed on the MOST ring to the audio amplifier to allow audio output to be played on the vehicle speakers or on the cordless headphones.

Video input from the TV tuner, DVD autochanger and the AVIO panel is also processed by the module and passed to the two RSE LCD screens and the TAD on separate video connections. The RSE module also controls the power supplies to the RSE LCD screens and relays the infrared remote control signals received by the RSE LCD screen infrared sensors to the DVD autochanger. The infrared signals are passed from the RSE LCD screens to the RSE module on a bus system known as the IS bus.

The DVD autochanger outputs some of its information to the RSE module on an Alpine proprietary bus known as the Ai Net.

The RSE module has two modes of operation; engine running mode and reduced operation mode. With the engine running the RSE module has full functionality. When the engine is not running the RSE module has reduced functionality to prevent excessive drain on the vehicle battery. The reduced functionality comprises a reduced audio volume and time limit on system operation.

The reduced audio volume is only active when the engine is not running. The audio volume is limited to a maximum setting of 12 to reduce battery consumption. If the volume was set at a higher level than this when the engine was running, when the engine is subsequently started, the volume level will gradually increase to the previously selected setting. This prevents the user being distracted by a sudden increase in volume.

The time limit operation is active when the key is removed from the ignition and the system is manually switched on using the TAD. The system will operate for a maximum of one hour. The battery voltage is continually monitored by the IHU. If the IHU detects that the battery voltage has fallen below a predetermined level, the IHU will shut the infotainment system down to prevent further battery drain. Once the system has shut down due to low battery voltage, it can only be restarted when the engine is running and the battery voltage has risen above the threshold level for more than one minute.

The module is connected into the infotainment system with five harness connectors.

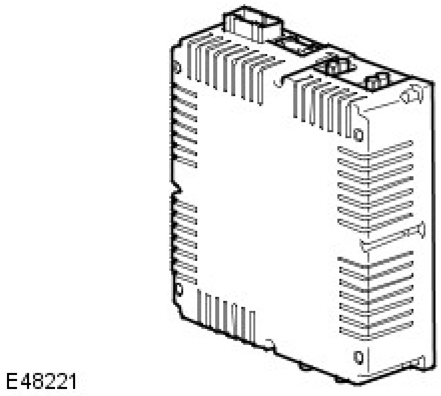
TELEVISION

Television Tuner Module



The television tuner module is located in the rear RH side of the luggage compartment. The television tuner is connected to the rest of the entertainment system on the MOST bus. Audio and control signals are passed on the MOST bus while video is transmitted via a coaxial cable to the Touch Screen Display (TAD).
For additional information, refer to: Communications Network (418-00 Module Communications Network, Description and Operation).

Television audio can be heard through the vehicle speakers and the remote control rear headphone modules. The audio will continue to be heard whilst the vehicle is moving, however the television picture will stop displaying once the vehicle starts moving.

Televison Tuner Module Harness Connector C2117

Pin No	Description	Input/Output
1	12V battery supply from infotainment relay	Input
2	GND	Input
3	Not used	
4	TV video signal	Output
5	TV video signal GND	Input
6-20	Not used	-

Televison Tuner Module Harness Connector C2106

Pin No	Description	Input/Output
1	MOST Rx- optical signal receive	Input
2	MOST Tx- optical signal transmit	Output

Televison Tuner Module Harness Connector C2228

Pin No	Description	Input/Output
1	LH rearward TV antenna amplifier	Input
2	LH forward TV antenna amplifier	Input

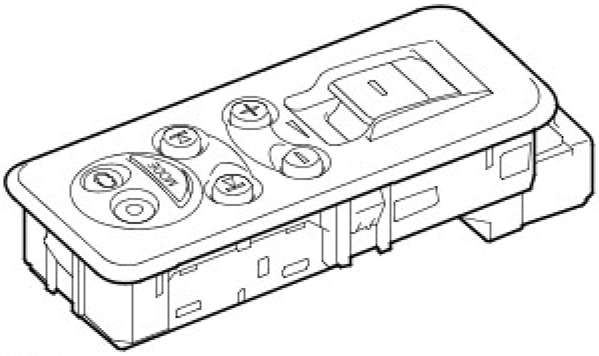
Televison Tuner Module Harness Connector C2227

Pin No	Description	Input/Output
1	RH rearward TV antenna	Input
2	RH forward TV antenna amplifier	Input

Two TV antennae are located in each rear side quarter window. The forward antenna is a high frequency antenna and the rearward antenna is a low frequency antenna. Each antenna is connected directly to a TV RF antenna amplifier which is located just above the rear quarter light, behind the trim.
For additional information, refer to: Antenna (415-02 Antenna, Description and Operation).

REMOTE AUDIO CONTROLS

Rear Seat Remote Audio Controls



E56994

The rear seat passengers can use standard headphones to listen to audio from any of the sources fitted to the vehicle. These include:

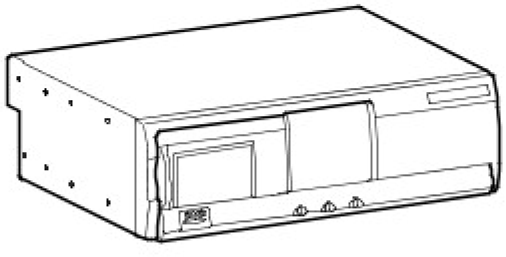
- Television
- CD
- Radio
- DVD

The remote audio control modules are located in the rear doors, incorporated into the rear window switches.

The remote audio control modules allow the user to select which source to listen to. The remote controls cannot override what the driver has selected. If the driver is listening to a CD the rear passenger cannot control the CD player.

The remote audio control modules allow the user to alter the volume in the head phones, change track/disc up/down or repeat on a CD, change pre-set radio stations or tune up/down on the radio and television.

DVD AUTOCHANGER



E48223

The DVD autochanger is located in the RH rear corner of the luggage compartment. The DVD player is a six disc design which will accept DVD movies, video CD's (VCD) and music CD's on CD-R or CD-RW. The discs are housed in a magazine to allow six discs to be stored in the unit. Additional magazines can be purchased to allow greater flexibility. The magazine is accessible via a sliding door on the front of the unit. An eject button, located behind the door, when pressed, automatically ejects the magazine from the unit.

The DVD autochanger is operated using a remote control unit supplied with the vehicle. The remote control is an infrared unit which transmits the infrared signal to receivers in each RSE LCD screen.

The DVD autochanger receives the remote control information from the RSE LCD screens on a bus system known as the IS bus to the RSE module. The information is then passed from the RSE module on an Alpine proprietary bus known as the Ai Net to the DVD autochanger. The Ai Net is a bus system used to communicate between the RSE module and the DVD autochanger.

A Sony Philips Digital Interface Format (SPDIF) is used to output the audio from the DVD autochanger to the audio amplifier. The SPDIF is an optical system connected between the DVD autochanger and the audio amplifier. SPDIF is a standard audio file transfer format which allows the transfer of digital audio signals from one device to another without having to be converted first to an analog format which maintains the viability of the digital audio signal.

DVD Autochanger Harness Connector C2494 (RSE)

Pin No.	Description	Input/Output
1	Remote control GND	Output
2	Remote control signal	Output
3	Start-up	Output
4	Ai net shield GND	Input
5	Ai net +	Input
6	DVD video shield GND	Output
7	Audio shield GND	Output
8	Audio GND	Output
9	Ai net -	Input
10	DVD video GND	Output
11	Video composite input	Output
12	DVD audio RH channel	Output

3	Not used	-
4	12V battery supply from infotainment relay	Input

DVD Autochanger Harness Connector C2614 (SPDIF)

Pin No.	Description	Input/Output
1	SPDIF digital audio output to audio amplifier	Output

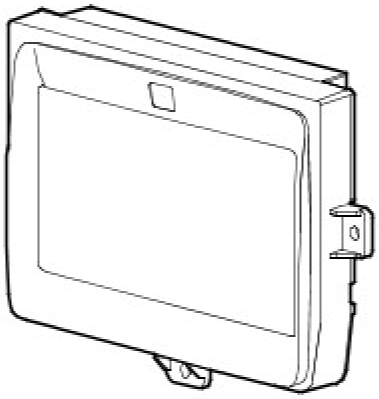
Fault Finding

If the operation of the DVD freezes or the screens do not display, turning the power to the unit off and then back on may clear the fault. Alternatively, change the source from DVD and back to DVD, turn the ignition switch to off and then on again to position II. The following table gives possible faults, their causes and remedies.

Symptom	Cause	Remedy
DVD unit does not	Fuse blown	Check and replace with fuse of correct rating

Symptom	Cause	Remedy
operate.		
	RSE LCD screen monitor power off	Ensure power is supplied to monitors
	Condensation	Wait for at least one hour for condensation to dry out
Operation is unstable	Remote control handset batteries low	Replace batteries
	Remote control receiver sensor or transmitter is dirty	Clean the receiver sensor and/or the transmitter
No picture	Monitor mode is switched to an incorrect mode	Use switch on back of handset to select the correct mode
Playback does not start	Disc is loaded upside down	Check disc is correctly loaded
	An incorrect format of disc is loaded	Check disc format is compatible
	Parental lock is set	Cancel parental lock or check rating of disc
	Setup menu is displayed	Press 'Set' for at least 2 seconds to turn the menu off
Picture is unclear or noisy	Disc is being fast forwarded or reversed	The picture may be slightly disturbed in this mode
	Vehicle battery power low	Check the vehicle battery condition
Image freezes	Disc is scratched	Replace with an undamaged disc
'NO MAG' displayed	No magazine is loaded	Load a magazine
'NO DISC' displayed	No disc is loaded	Load disc into magazine
	Disc is dirty	Clean disc
Ø	Remote control operation is not possible	For some discs and playing modes certain operations are not possible. This is not a malfunction.
'REGIONAL CODE VIOLATION' displayed	Disc does not match regional code number	Load a disc which matches the regional code number
'VIDEO SIGNAL IS NOT CORRECT' displayed	NTSC disc is loaded in a PAL system or PAL disc is loaded in an NTSC system	Load a PAL disc
'HI-TEMP' displayed	Protective circuit is activated to high temperature	Turn the power OFF on the unit and then back on again. If the display does not disappear leave the power off until the temperature decreases and turn the power ON again.
Handset does not operate DVD	Battery power in handset low	Replace batteries
	Direct sunlight in handset transmitter or RSE LCD screen receiver	Protect infrared sensors from direct sunlight
	Universal handset mode switch incorrectly set	Looking at the rear face of the handset, ensure that the mode switch is in the LH position
	Batteries incorrectly installed	Check batteries or correctly fitted
	Handset not pointed at RSE LCD screen	Point the handset directly at the screen

REAR SCREENS



M866194

The RSE LCD screens are located in the rear of the front seat head restraints. The screen is secured in the head restraint with three screws which are covered by a removable surround. The screen is a 6.5 inch, auto dimming, high resolution LCD monitor, manufactured by Alpine

An ambient light sensor, in the bottom left edge of the screen, allows the system to automatically adjust the brightness of the screen to compensate for changes in ambient light levels.

An infrared receiver sensor is located centrally in the upper screen surround. The sensor receives infrared transmissions from the DVD remote control and passes them to the DVD autochanger, via the RSE module on a bus system known as the IS bus. All screen settings can be changed using the RSE remote control.

The screen should be cleaned with a lightly, water moistened cloth. Do not use chemical agents or domestic products to clean the screen or any part of the surround.

Each RSE LCD screen is connected to the infotainment system using a 20 pin harness connector.

Pin No.	Description	Input/Output

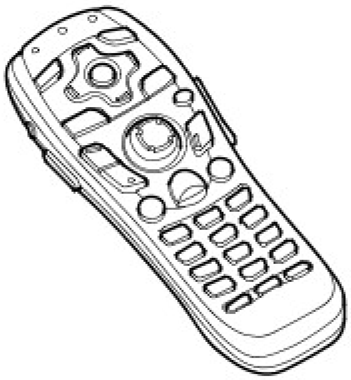
REMOTE CONTROL



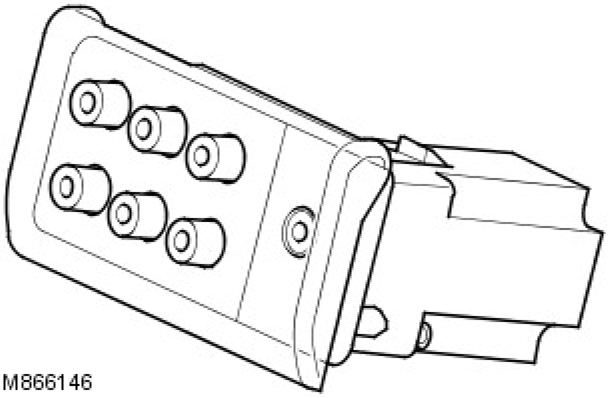
E48227

The remote control for operation of the DVD autochanger is a universal infrared type. A switch on the rear of the control selects either the left hand or right hand screens and allows the individual settings for each screen to be changed as required. The switch has a central position which disables the remote control and prevents battery drain.

The remote control transmits an infrared signal in response to operation of a button. The signal is received by a sensor located on each RSE LCD screen and is passed, via an IS bus to the RSE module. From the RSE module the signal is passed on an Alpine proprietary bus known as the Ai Net, to the DVD autochanger. The remote control also allows selection of an auxiliary input from the AVIO panel (video or games console) or selection of audio (radio or CD).

The remote control is powered by two 'AAA' batteries located in the rear of the control and are accessible by removing a sliding cover. When inserting the batteries it is important that the battery polarity is observed as marked in the battery compartment. light emitting diode (LED)'s at the top left and right hand corner of the control indicates that the remote control is operating when a button is pressed. Only one LED will illuminate depending on which screen is selected. If the LED's fail to illuminate when a button is pressed, the battery voltage may be low or the switch on the rear of the control may be set in the central 'off' position.

AUDIO VIDEO INPUT OUTPUT PANEL



The AVIO panel is located at the rear of the centre console. The panel provides for the connection of auxiliary audio and video inputs from an external source, such as a games console, via seven plugs on the panel. The plugs are covered by a lift up panel.

Two sets of video and audio phono plugs are provided and are designated as AV1 and AV2. The plugs are connected to the RSE module and allow the auxiliary input video to be played on the RSE LCD screens and the audio to be played on the vehicle speakers or via the rear headphone modules. The auxiliary input video cannot be displayed on the TAD.

An additional single, 3.5mm jack plug allows for the attachment of an auxiliary audio input, such as a personal stereo or MP3 player. This plug is connected directly to the IHU and allows audio to be played on the vehicle speakers.

The AVIO panel is connected to the infotainment system using two harness connectors.

Video System - Video System

Diagnosis and Testing

Overview

The video system combines a number of the networks and modules on the vehicle to provide a full entertainment package to the passengers.

Because of the complexity of the system, there are a variety of different techniques involved in diagnosing the system, as the networks used include medium speed controller area network (CAN), media oriented system transport (MOST), and other system-specific methods.

For information on the description and operation of the video system, refer to the relevant section of the workshop manual.

For information on the description and operation of the networks, refer to the Network Communications section of the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
● Front touch screen display (TSD) installation and condition ● Rear seat entertainment (RSE) screen installation and condition ● Digital versatile disc (DVD) multi-changer installation and condition ● Television antennae (two in each rear side window)	● Fuses - CJB - fuse 42P - CJB - fuse 52P - CJB - fuse 53P - CJB - fuse 57P - CJB - fuse 58P ● Electrical harnesses ● Fibre optic cable harnesses ● Infotainment relay ● Display screens ● DVD multi-changer ● Television tuner module ● RSE module ● Television antenna amplifiers (4) ● Remote control and batteries

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Because the DTCs are stored in more than one module, a complete vehicle read is recommended.
    - Make sure that all DTCs are cleared following rectification

Symptom chart

Symptom	Possible causes	Action
The DVD does not operate	● DVD multi-changer fuse blown ● No power to display screens ● Condensation	Check the DVD circuits for a short circuit causing fuse failure and rectify as necessary. Refer to the electrical guides. Check for power to the display screens, rectify as necessary. Refer to the electrical guides. Wait at least one hour for the condensation to dry out.
Remote control operation is unstable	● Handset batteries low on power ● Remote control receiver sensor or transmitter is dirty	Check and renew the batteries as necessary. Check and clean the receiver and transmitter as necessary.
There is no picture	● The display screen is set to an incorrect mode	Use the switch on the back of the handset to select the correct mode.

Symptom	Possible causes	Action
Playback does not start	- Disc is loaded upside-down - An incorrect format of disc is loaded - Parental lock is set - The setup menu is displayed	Check that the disc is correctly loaded. Check that the disc format is compatible. Cancel parental lock or check the rating of the disc. Press **SET** for at least 2 seconds to turn the setup menu off.
The picture is unclear or noisy	- The disc is being fast forwarded or rewound - The vehicle battery power is low	The picture may be slightly distorted in fast forward or rewind modes. Check the vehicle battery condition and state of charge.
The image "freezes"	- The disc is scratched	Load an undamaged disc.
NO MAG is displayed	- There is no magazine loaded into the DVD multi-changer	Load a magazine.
NO DISC is displayed	- There is no disc loaded into the magazine - The disc is dirty	Load a disc into the magazine. Clean the disc as necessary.
REGIONAL CODE VIOLATION is displayed	- The disc loaded does not match the regional code number	Load a disc which matches the regional code number.
VIDEO SIGNAL IS NOT CORRECT is displayed	- An NTSC disc is loaded into a PAL system, or vice versa	Load a disc of the correct format.
HI TEMP is displayed	- The system protective circuit is activated as it has detected a high temperature	Turn the power **OFF** on the unit and then back on again. If the display does not clear, leave the power off until the temperature decreases and turn the power **ON** again.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
B100E25	Video Input "A"	- Television/Rear seat entertainment video input disconnected - TV/DVD malfunction	Check that the input is connected and that the system is transmitting.
B101025	Video Input "C"	- Rear camera video input disconnected - Camera malfunction	Check that the input is connected and that the system is transmitting.
B1A0016	Control module	- Control module circuit voltage below threshold: - Voltage less than (master control module voltage - 2V) for > 10 seconds - Battery voltage low - Control module circuit High resistance	Check the battery condition and state of charge. Refer to the relevant section of the workshop manual. Check the module power and ground circuits. Refer to the electrical guides.
B1A0017	Control module	- Control module circuit voltage above threshold - Battery voltage high (overcharging) - Control module circuit short circuit to power	Check the battery condition and state of charge. Refer to the relevant section of the workshop manual. Check the module power and ground circuits. Refer to the electrical guides.
B1A0044	Control module	- Rear entertainment control module - data memory failure	Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
B1A0048	Control module	● Control module supervision software fault	Configure the module using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
B1A0049	Control module	● Amplifier internal electrical failure (can be set in more than one module) ● Touch screen display (TSD) internal electrical failure (can be set in more than one module)	Check the power and ground circuits to the module. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
B1A0098	Control module	● Rear entertainment control module, component or system over-temperature	Check the module and circuits. Refer to the electrical guides. Clear the DTC and retest. Consider the atmospheric conditions before condemning a module.
B1A5611	Antenna	● Antenna circuit short circuit to ground	Refer to the electrical guides and check the antenna circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A5612	Antenna	● Antenna circuit short circuit to power	Refer to the electrical guides and check the antenna circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1A5613	Antenna	● Antenna circuit high resistance	Refer to the electrical guides and check the antenna circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1D5079	Digital Disk Player	● Digital versatile disc (DVD) changer mechanical fault - Error report from AiNet	Check for a mechanical fault (jammed magazine, etc). Rectify as necessary.
B1D5093	Digital Disk Player	● Digital versatile disc (DVD) changer is not responding ● Communication error between the main and DVD microprocessors - No response from AiNet	Refer to the electrical guides and check the AiNet circuits. Rectify as necessary.
B1D5098	Digital Disk Player	● A high temperature condition has been detected	Check the installation of the DVD module. Make sure there is sufficient airflow. Clear the DTC and retest. Consider the atmospheric conditions before condemning a module.
B1D5511	Antenna #2	● Antenna 2 circuit short circuit to ground	Check the antenna and circuits. Refer to the electrical guides.
B1D5512	Antenna #2	● Antenna 2 circuit short circuit to power	Check the antenna and circuits. Refer to the electrical guides.
B1D5513	Antenna #2	● Antenna 2 circuit High resistance	Check the antenna and circuits. Refer to the electrical guides.
B1D5611	Antenna #3 circuit	● Antenna 3 circuit short circuit to ground	Check the antenna and circuits. Refer to the electrical guides.
B1D5612	Antenna #3 circuit	● Antenna 3 circuit short circuit to power	Check the antenna and circuits. Refer to the electrical guides.
B1D5613	Antenna #3 circuit	● Antenna 3 circuit High resistance	Check the antenna and circuits. Refer to the electrical guides.
B1D5711	Antenna #4 circuit	● Antenna 4 circuit short circuit to ground	Check the antenna and circuits. Refer to the electrical guides.
B1D5712	Antenna #4 circuit	● Antenna 4 circuit short circuit to power	Check the antenna and circuits. Refer to the electrical guides.
B1D5713	Antenna #4 circuit	● Antenna 4 circuit High resistance	Check the antenna and circuits. Refer to the electrical guides.

DTC	Description	Possible causes	Action
B1D5811	Television Output	- Television output circuit short circuit to ground	Check the television output circuits. Refer to the electrical guides.
B1D5812	Television Output	- Television output circuit short circuit to power	Check the television output circuits. Refer to the electrical guides.
B1D5813	Television Output	- Television output circuit High resistance	Check the television output circuits. Refer to the electrical guides.
B1D8193	Rear Left Display Module	- Left hand rear display is not responding - Communication error between the main and left hand display microprocessors - No response from the IS bus	Check the IS bus circuits. Refer to the electrical guides.
B1D8198	Rear Left Display Module	- A high temperature condition has been detected	Clear the DTC and retest. Consider the atmospheric conditions before condemning a module.
B1D8293	Rear Right Display Module	- Right hand rear display is not responding - Communication error between the main and right hand display microprocessors - No response from the IS bus	Check the IS bus circuits. Refer to the electrical guides.
B1D8298	Rear Right Display Module	- A high temperature condition has been detected	Clear the DTC and retest. Consider the atmospheric conditions before condemning a module.
U1A0131	Communication Link	• NOTE: 'NO NAVIGATION AVAILABLE' message is displayed - Navigation module - touch screen display (TSD), gigabit video interface (GVIF) fault - GVIF disconnected - GVIF - short to ground, power, open circuit	Check for correct connection of GVIF circuit connectors. Refer to the electrical circuit diagrams and check the multi-media module GVIF circuits for short to ground, power, open circuit
U1A1731	Incomplete MOST Ring Reported By REM	- No signal from the rear entertainment module (REM) - Fibre optic ring break condition reported	Carry out the general MOST test. Refer to the Network Communications section of the workshop manual and in the approved diagnostic system.
U1A2087	Incomplete MOST Ring Reported By TVM	- No signal from the TV module (TVM) - Fibre optic ring break condition reported	Carry out the general MOST test. Refer to the Network Communications section of the workshop manual and in the approved diagnostic system.
U300068	Control Module	- Audio unit event information - MOST transceiver overheating	Refer to the electrical guides and check the power and ground circuits to the component. Check the MOST circuit. Carry out the general MOST test. Refer to the Network Communications section of the workshop manual and in the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.

Video System - Digital Versatile Disc (DVD) Player

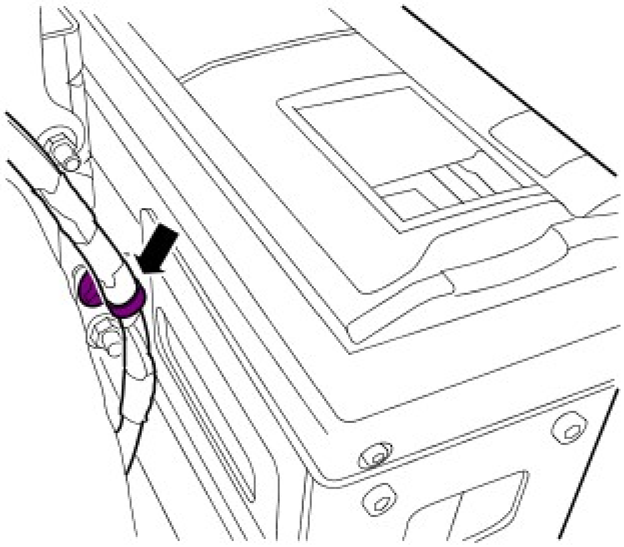
Removal and Installation

Removal

1. Remove the RH lower rear quarter trim panel.
For additional information, refer to: Rear Quarter Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

2. Release the DVD player harness.

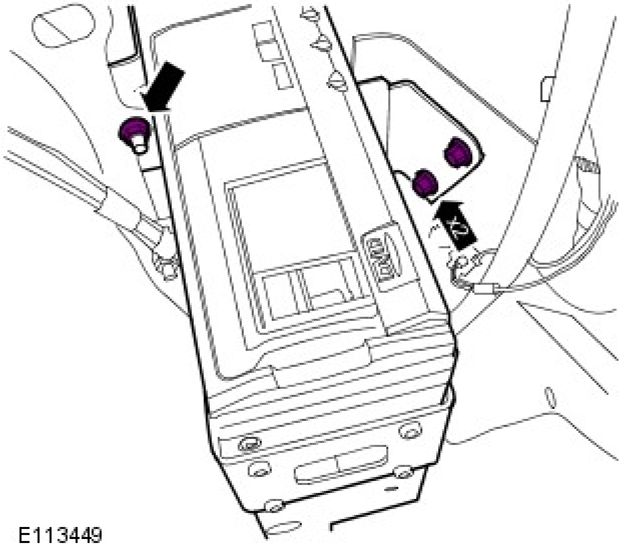
- Release the clip.



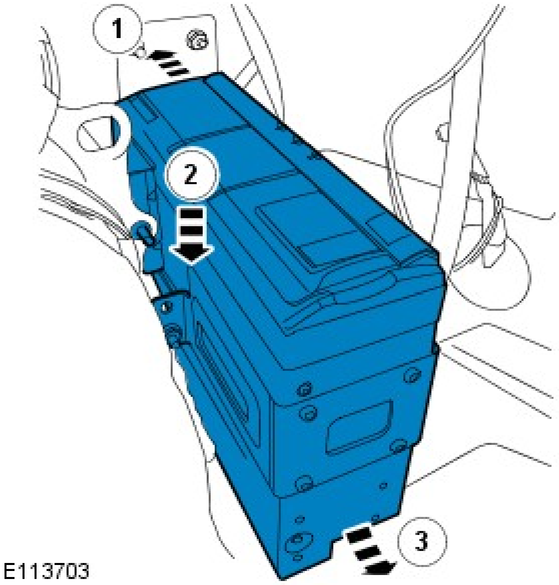
E113448

3. Release the DVD player from the body.

- Remove the 2 bolts.
- Remove the nut.

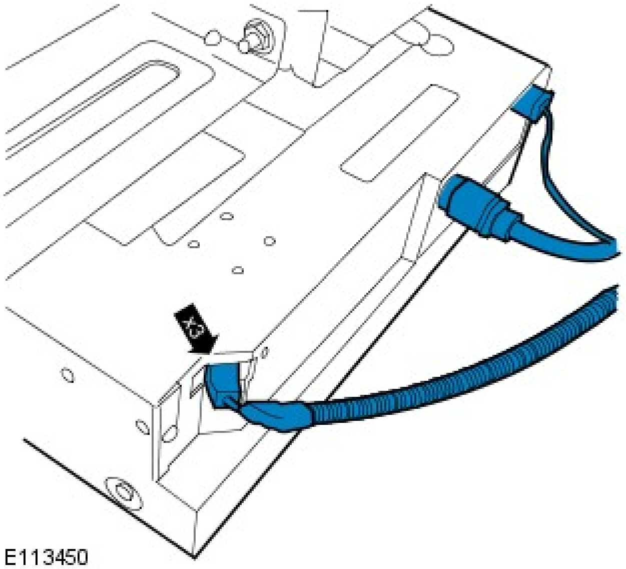


E113449



E113703

4. Detach the DVD player from the body.



E113450

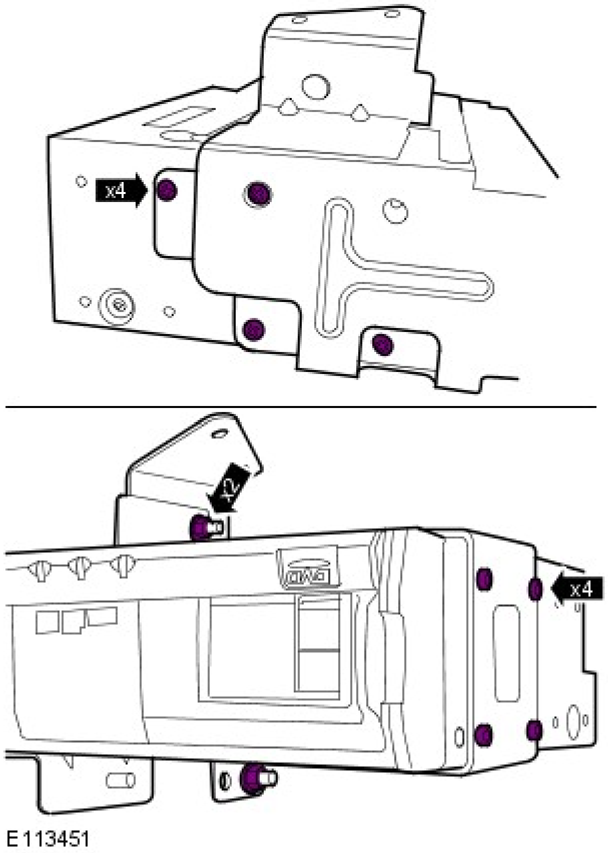
5. CAUTIONS:

⚠ Make sure that the fiber optic cables are not bent to a radius of less than 25 mm.

⚠ Make sure that the optical connectors are clean and free of foreign material.

Remove the DVD player.

- Disconnect the 3 electrical connectors.



x4
x2
x4
E113451

6. Remove the DVD player mounting bracket.

- Remove the 8 screws.
- Loosen the 2 nuts.

Installation

1. To install, reverse the removal procedure.

GENERAL

The exterior lighting system comprises the following exterior lamps:

- Front and rear side lamps
- License plate lamps
- Side marker lamps (if fitted)
- Front and rear turn signal indicator lamps
- Turn signal indicator repeater lamps
- Stop lamps and high mounted stop lamp
- Reversing lamps
- Rear fog lamps
- Front fog lamps (if fitted)
- Cornering/Static bending lamps (if fitted) - All except NAS
- Low and high beam headlamps
- Adaptive Front lighting System (AFS) (if fitted).

Exterior Bulb Type/Rating

The following table shows the bulbs used for the exterior lighting system and their type and specification.

Bulb	Type	Rating
Halogen Headlamps - Low/High beam	Halogen H7	55W
Xenon headlamps - Low/High Beam	Xenon D2S	35W
Headlamps - High Beam	Halogen H7	55W
Front fog lamps	Halogen H11	55W
Rear fog lamps	Bayonet P21	21W
Turn signal indicator lamps - Front - ROW	Bayonet PY21W	21W
Turn signal indicator lamps - Front - NAS	Wedge S8W 3457K	27/7W
Turn signal indicator repeater lamps	Capless W5W	5W
Turn signal indicator lamps - Rear	Bayonet P21	21W
Side lamps - Front	Capless W5W	5W
Stop/Tail lamps	Bayonet - Twin filament P21/5	21W/5W Note: 21W filament not functional on lower tail lamp
High mounted stop lamp	LED's	-
License plate lamps	Capless W5W	5W
Reverse lamps	Bayonet P21	21W
Cornering lamp/Static bending lamp	Halogen H8	35W
NAS - Side marker lamp (front/rear)	Capless W3W	3W

CENTRAL JUNCTION BOX

The Central Junction Box (CJB) is an integrated unit located behind the instrument panel on the passenger side of the bulkhead. The CJB contains fuses, relays and a number of microprocessors which control the power supply and functionality of the lighting system and other vehicle systems.

Input Signals

The CJB receives inputs from the following switches:

- Lighting control switch
    - Side lamp position
    - Headlamp position
    - Automatic (AUTO) position (if fitted)
- Brake switch
- Left hand steering column multifunction switch for turn signal indicators and high beam/headlamp flash
- Hazard flasher switch
- Rain/light sensor (LIN signal)

Circuit Protection

The CJB provides circuit protection for all exterior lighting circuits. Most exterior lighting circuits are protected by conventional fuses, however, the following circuits are protected by Field Effect Transistors (FETs).

- Low beam
- High beam
- Cornering/static bending lamps
- Turn signal indicator lamps
- Trailer turn signal indicator lamps.

Operation of the above listed circuits is protected by FETs which can detect overloads and short circuits. The FETs respond to heat generated by increased current flow caused by a short circuit. On a normal circuit this would cause the fuse to blow. The FETs respond to the heat increase and disconnect the supply to the affected circuit. When the fault is rectified or the FET has cooled, the FET will reset and operate the circuit normally. If the fault persists the FET will cycle, disconnecting and reconnecting the power supply.

The CJB stores fault codes which can be retrieved using T4. The fault code will identify that there is fault on a particular output which will assist with fault detection.

Alarm Indications

The exterior lighting system is used for alarm arm and disarm requests.

When the driver locks the vehicle, a visual indication of a successful lock request is displayed to the driver by the hazard flashers operating three times with a pattern of 500ms on and 500ms off.

When the driver unlocks the vehicle, a visual indication of a successful unlock request is displayed to the driver by the hazard flashers operating once for 3 seconds.

If the alarm is triggered, the hazard flashers are operated for ten 30 second cycles of on for 380ms and off 380ms with a 5 second off delay between each cycle.
For additional information, refer to: Anti-Theft - Active (419-01A Anti-Theft - Active, Description and Operation).

Lights on Warning Chime

When the ignition switch is in the off (0) or auxiliary (I) position and the lighting control switch is in the side lamp or headlamp position, a warning chime will sound if the driver's door is opened. This indicates to the driver that the exterior lights have been left on.

The chime is generated from the instrument cluster sounder on receipt of a lights on signal, a door open signal and an ignition switch off signal from the CJB on the CAN bus.

Crash Signal Activation

When a crash signal is transmitted from the restraints control module, the CJB activates the hazard flashers and the turn signal indicators in the instrument cluster.

The hazard flashers will continue to operate until the ignition switch is moved to the auxiliary position I or the off position O or the restraints control module no longer transmits the crash signal.
For additional information, refer to: Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) (501-20B Supplemental Restraint System, Description and Operation).

Headlamp Timer

The CJB controls a headlamp timer function which allows the headlamps to remain on for a period of time after leaving the vehicle. This is a driver convenience feature which illuminates the driveway after leaving the vehicle.

To select this feature, the lighting control switch must be in the headlamp or side lamp position when the ignition switch is moved from the ignition position II to the off position. The lighting control switch must be moved to the off position or AUTO position (if fitted) to activate the timer. The timer function will then be initiated and low beam headlamps will be illuminated for the selected timer period.

The timer period is selectable by the driver and can range from 10 to 60 seconds in 10 second increments. The default timer period is set at 20 seconds.

The default setting can be changed by a Land Rover or authorised dealer or by the driver using the vehicle's customer personalisation options.
For additional information, refer to: Information and Message Center (413-08 Information and Message Center, Description and Operation).

With the vehicle stationary and the ignition switch in any position, pressing the trip computer button on the end of the left hand steering column multifunction switch gives access to the options. The options can be scrolled through using the audio search buttons on the steering wheel. The options are displayed in the message center. When the headlamp timer option is reached, the settings can be changed using the audio search buttons on the steering wheel. When the selection has been made confirmation is performed by pressing the trip computer button.
For additional information, refer to: Information and Message Center (413-08 Information and Message Center, Description and Operation).

• NOTE: The headlamp timer feature will be cancelled under the following conditions:

- The ignition switch is moved from auxiliary (I) to ignition (II)
- The lighting control switch is moved from off to side lamps.

The headlamp timer can also be operated using the ignition key personal button, if this feature has been set by the driver.
For additional information, refer to: Handles, Locks, Latches and Entry Systems (501-14 Handles, Locks, Latches and Entry Systems, Description and Operation).

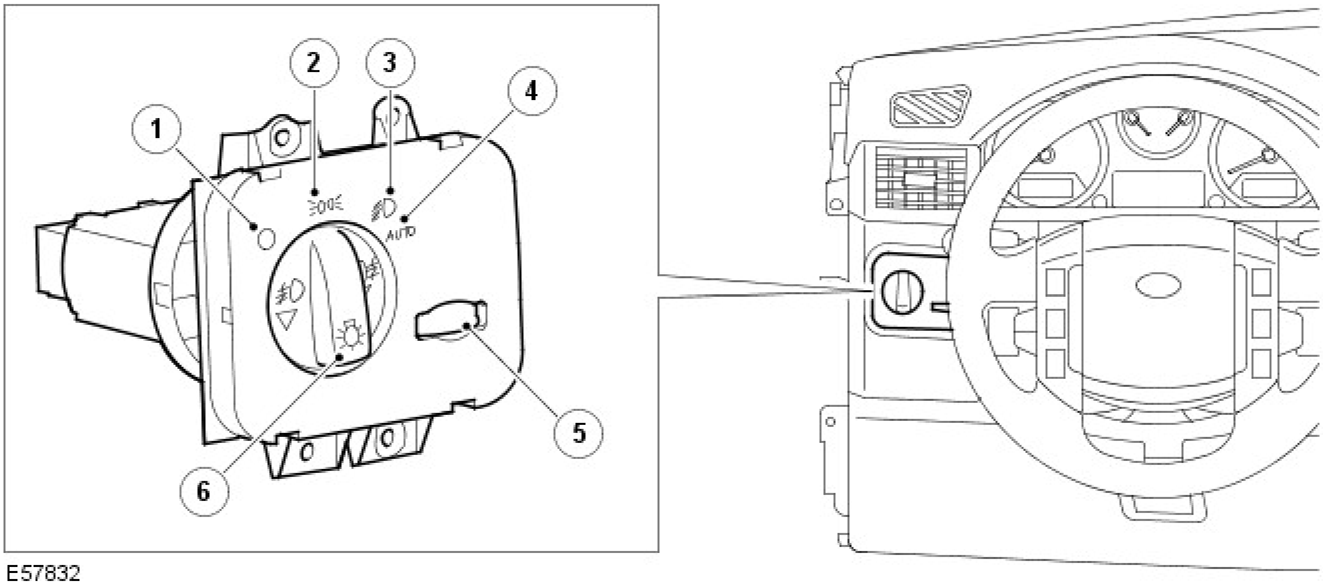
• NOTE: In certain markets the headlamp timer function using the ignition key personal button also activates the reversing lamps to provide additional illumination at the rear of the vehicle.

LIGHTING CONTROL SWITCH

The lighting control switch is located in the driver's side of the instrument panel, below the outer fresh air vent. The switch contains a rotary switch for selecting the vehicle exterior lighting functions and an instrument illumination dimmer rheostat.

Two variants of the switch are available to cover the different vehicle specifications and market variations.

• NOTE: Lighting control switch with AUTO function shown



E57832

Item	Part Number	Description
1	-	OFF position
2	-	Side lamps position
3	-	Headlamps position
4	-	Automatic headlamps position (if fitted)
5	-	Instrument illumination dimmer control
6	-	Rotary control switch

All outputs from the lighting control switch, with the exception of the dimmer control output, are subject to a voltage drop through the switch of approximately 200mV. Therefore, assuming that the input voltage to the switch is 12V, then the voltage measured at the switch output pins will be 11.8V.

Rotary Control

The rotary control can be turned to select one of four positions; off, side lamps, headlamps and automatic (AUTO). On vehicles without the automatic feature the switch only has three positions.

Three additional positions for fog lamps are available by pulling the rotary control; all fog lamps off, front fog lamps on only and front and rear fog lamps on. On vehicles without front fog lamps the switch can only be pulled once to activate the rear fog lamps.

On vehicles fitted with front fog lamps, the rotary control can be pulled to select fog lamps when it is in the side lamps or headlamps positions.

The rotary control can only be pulled to select rear fog lamps when it is in the headlamps position.

The fog lamps will be switched off automatically when the rotary control is turned to the off position or pushed in to the fog lamps off position.

Dimmer Control

The dimmer control provides a Pulse Width Modulated (PWM) output to control the illumination brightness of the instrument panel and other illumination. The dimmer switch operates using a rotary thumbwheel which is connected to a rheostat and a high side switch.

The rheostat is a variable resistor which provides a high or low resistance according to its set position. This output is passed to a switchable capacitor or a high side switch. The high side switch uses the output from the rheostat to determine the switching frequency of the capacitor which provides the PWM output of between 8 and 12V to determine the brightness of the illumination.

Automatic Headlamps

Refer to Automatic Headlamps in this section.

HEADLAMP ASSEMBLY

Three types of headlamp are available; Halogen, Bi-Xenon or Adaptive Front lighting System (AFS). The headlamps share a common, clear lens.

The headlamps are located on the front carrier assembly. Each headlamp is secured to the front carrier assembly with two locking plates. The locking plate slides in grooves in the rear of the headlamp and two holes in each plate locate on pins on the carrier. Each locking plate is pressed down to lock the pins in the locking plate holes. The locking plates allow removal of the headlamp from the carrier for bulb changing without the requirement for special tools. Removal of a headlamp requires the removal of the radiator grille.

The rear of the headlamp unit has removable access panels which allow access to the bulbs for replacement. A large cover, which is rotated anti-clockwise to remove, allows access to the low/high beam bulb on both halogen and xenon headlamps. Another removable cover provides access to the high beam only halogen bulb which is retained with a spring clip. A smaller cover, which is located behind the outer locking plate, can also be rotated anti-clockwise to provide access to the turn signal lamp bulb. Another cover located on the underside of the headlamp assembly provides access to the side lamp bulb, the cornering lamp/static bending lamp bulb and the side marker lamp bulb on NAS models.

The headlamps have two adjustment screws on the rear which allow for the manual setting of the vertical and horizontal alignment.

On NAS vehicles the headlamp is regarded as 'Visual Optically Left' (VOL) aiming. These have to be moved in the same direction and by the same amount to create vertical movement of the beam pattern. There is no horizontal adjustment. Refer to the Service Repair Procedures manual for headlamp alignment data and procedures.

Each headlamp has an integral sixteen pin connector which provides inputs and outputs for the various functions of the headlamp assembly. The usage of the pins differs between model variants, refer to the Electrical Reference Library (ERL) for pin details.

The low beam headlamps are switched on when the ignition switch is in the ignition position (II) and:

- the lighting control switch is in the headlamp position
- the lighting control switch is in the AUTO position and a 'lights on' signal is received by the CJB from the rain/light sensor.

The low beam headlamps can also be operated by the headlamp delay feature.

The high beam headlamps are switched on when the ignition switch is in position (II) and:

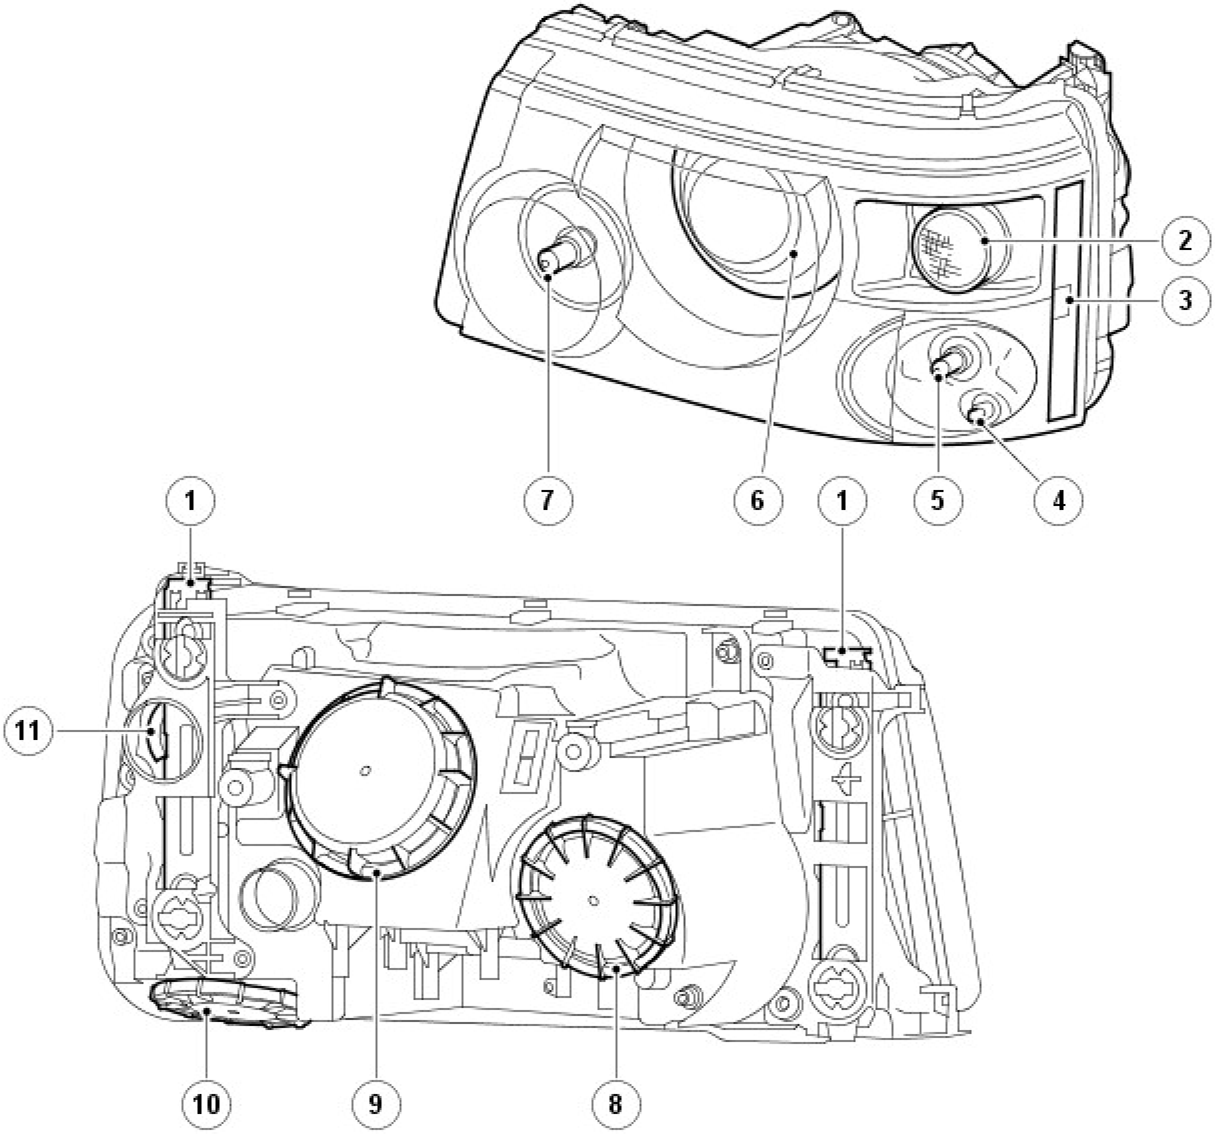
- The low beam headlamps are selected on in the headlamp position or activated via the AUTO feature
- The left hand steering column multifunction switch is pushed forward away from the driver.

The high beam headlamps will be switched off when:

- The left hand steering column multifunction switch is moved rearward towards the driver

- The low beam headlamps are switched off
- The ignition switch is moved to the auxiliary position (I) or off position (0).

Halogen Headlamps



E57833

Item	Part Number	Description
1	-	Locking plate
2	-	Turn signal indicator lamp
3	-	Side marker lamp (NAS only)
4	-	Side lamp
5	-	Cornering lamp (if fitted)
6	-	Bi-halogen low/high beam headlamp
7	-	High beam headlamp
8	-	High beam lamp access cover
9	-	Low/high beam lamp access cover
10	-	Side lamp/cornering lamp/side marker lamp access cover
11	-	Turn signal indicator lamp bulb holder (hidden)

The mono-halogen low beam only headlamp uses a projector lens, similar to the xenon headlamp. The projector module comprises an ellipsoidal lens and a reflector. The projector reflector collects the light produced by the halogen bulb and projects the light into a focal plane containing a shield. The contour of the shield is projected onto the road by the lens.

A complex surface reflector is used for the halogen fill in high beam lamp. This type of reflector is divided into separate parabolic segments, with each segment having a different focal length.

The low and high beam bulbs are quartz halogen H7, with a rating of 55W. The bulbs are retained in the headlamp unit with conventional wire retaining clips.

A tourist lever mechanism is located on the inboard side of the projector module. This mechanism moves a flap to blank off a portion of the beam spread to enable the vehicle to be driven in opposite drive hand markets without applying blanking decals to the headlamp lens. The beam is changed by removing the access cover at the rear of the lamp assembly and moving a small lever located near the bulb holder, at the side of the projector. The tourist function is operated by pushing the lever upwards on LH headlamps and downwards on RH headlamps.

Cornering Lamp

- NOTE: The cornering lamps are not fitted to NAS vehicles

The cornering lamps are an optional feature designed to illuminate the direction of travel when cornering at low speeds. The design of the lens projects a spread of light from the vehicle at approximately 45 degrees to the vehicle axis.

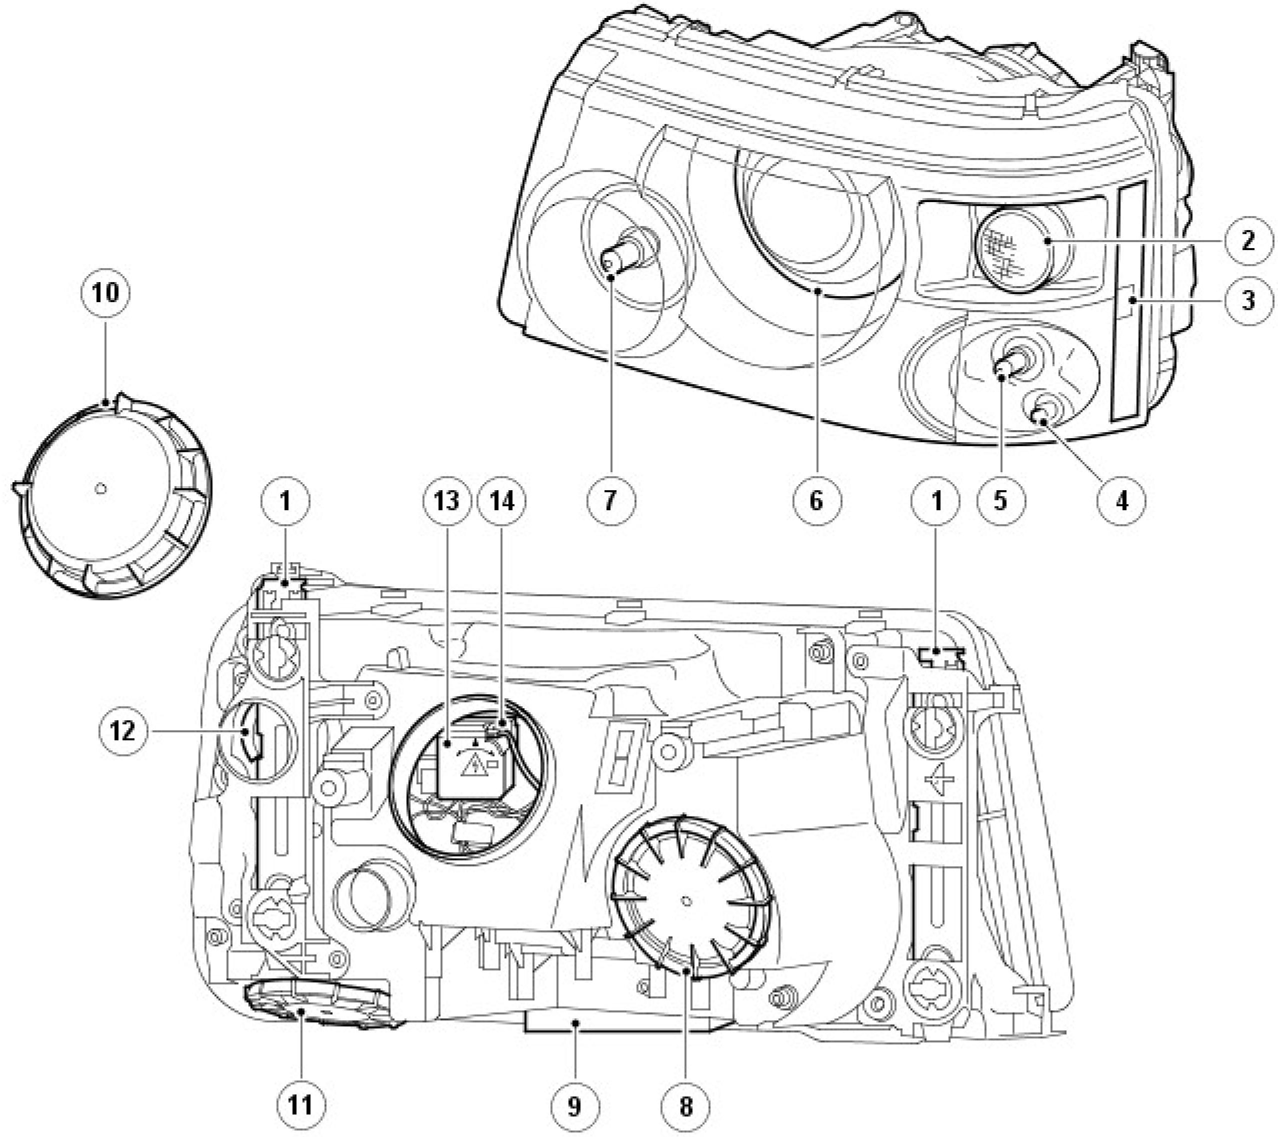
The cornering lamp is incorporated into the outer part of the headlamp assembly and shares the same housing and reflector as the side lamp.

The cornering lamp uses a 35W Halogen H8 bulb which is permanently located in an integral holder which is connected on the headlamp housing. The holder is located in an aperture in the headlamp housing and rotated to lock. The bulb is accessible via a removable cover on the base of the headlamp housing.

The cornering lamps are controlled by the left hand steering column multifunction switch with the lighting control switch in the headlamp position and the ignition switch in position II. The cornering lamps are supplied power via the ignition switch to ensure that they do not function with the headlamp delay feature. The cornering lamps are deactivated if the vehicle speed exceeds 25 mph (40 km/h).

Only one cornering lamp will illuminate at any one time. If the left hand turn signal indicators are selected on, the left hand cornering lamp will be illuminated and visa versa, providing the vehicle speed and lighting control switch positions are correct.

Xenon Headlamps



E57834

Item	Part Number	Description
1	-	Locking plate
2	-	Turn signal indicator lamp
3	-	Side marker lamp (NAS only)
4	-	Side lamps
5	-	Cornering lamp (if fitted)
6	-	Bi-Xenon low/high beam lamp
7	-	Halogen high beam lamp
8	-	High beam lamp access cover
9	-	Xenon control module
10	-	Low/high beam lamp access cover
11	-	Side lamp/cornering lamp/side marker lamp access cover
12	-	Turn signal indicator lamp bulb holder (hidden)
13	-	Igniter
14	-	Igniter connector

Safety Precautions

⚠ WARNING: The Xenon system generates up to 28000 volts and contact with this voltage could lead to fatality. Make sure that the headlamps are switched off before working on the system.

The following safety precautions must be followed when working on the xenon headlamp system:

- **DO NOT** attempt any procedures on the xenon headlamps when the lights are switched on.
- Handling of the D2S Xenon bulb must be performed using suitable protective equipment, e.g. gloves and goggles. The glass part of the bulb must not be touched.
- Xenon bulbs must be disposed of as hazardous waste.
- Only operate the lamp in a mounted condition in the reflector.

The xenon headlamps use a complex surface reflector for the Halogen fill in high beam lamp only lighting unit, which is of the same design as the high beam unit used on the Halogen headlamps. This type of reflector has the reflector divided into separate parabolic segments, with each segment having a different focal length.

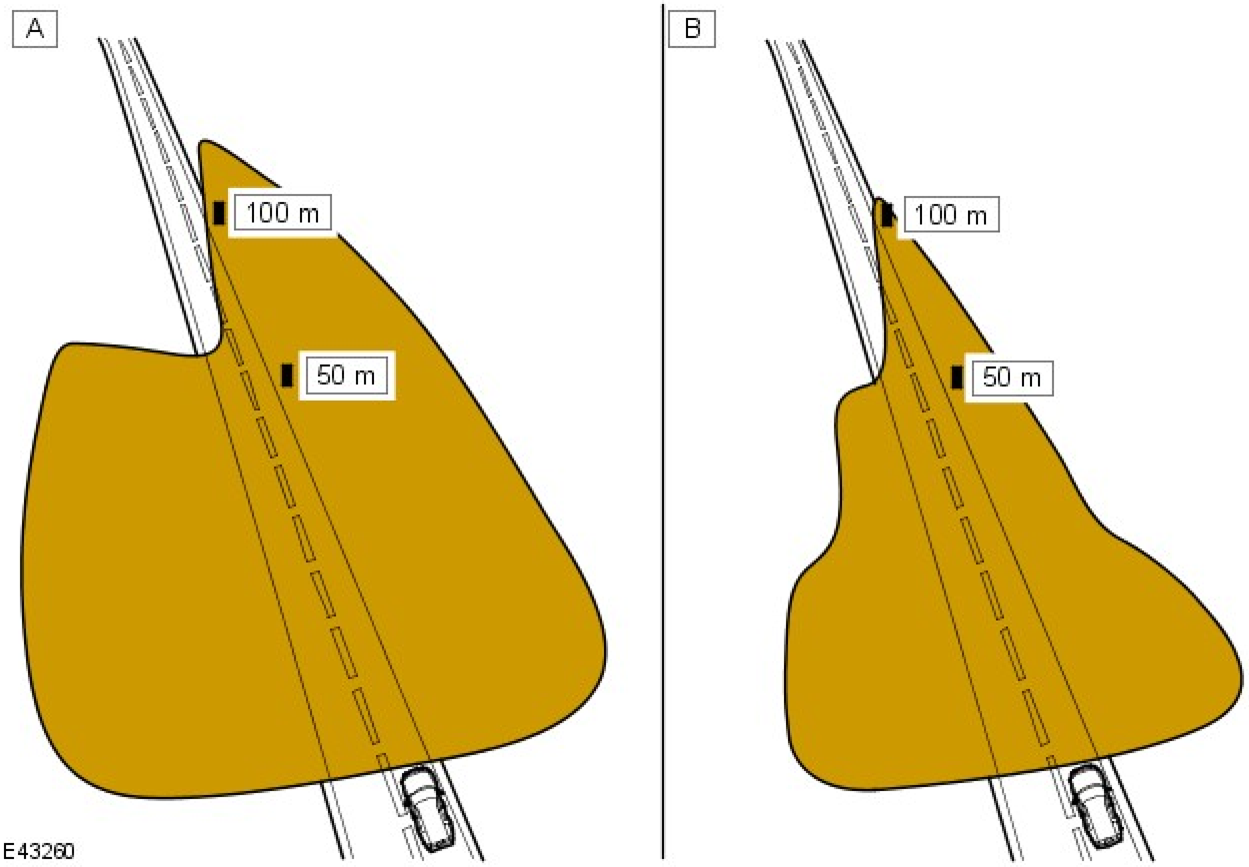
The high beam bulbs are quartz halogen H7, with a rating of 55W. The bulbs are retained in the headlamp unit with conventional wire retaining clips.

The xenon headlamp is known as bi-xenon and operates as both low beam and high beam headlamp unit. The xenon lamp or High Intensity Discharge (HID) lamp as they are sometimes called, comprises an ellipsoidal lens with a solenoid controlled shutter to change the beam output from low to high beam.

• NOTE: If the lighting control switch is in the OFF position, the xenon lamps do not operate when the high beam 'flash' function is operated. If the lighting switch is in the headlamps position or AUTO position with the low beam lamps active, the xenon low beam will remain on when the high beam 'flash' function is operated.

The xenon headlamp system is controlled by the CJB using a control module for each headlamp and an igniter. The control modules and the igniters provide the regulated power supply required to illuminate the xenon bulbs through their start-up phases of operation.

Xenon/Halogen Headlamp Beam Comparison



Item	Part Number	Description
A	-	Bi-Xenon
B	-	Halogen

The xenon low/high beam headlamps use ellipsoidal technology for the lens and reflector providing improved night time visibility compared to conventional halogen headlamps. The xenon headlamps provide the following benefits when compared to halogen headlamps:

- Longer bulb life - Approximately 3 to 5 times longer than a halogen bulb
- Increased light output - xenon headlamps output 3 to 4 times more light on the road surface than halogen headlamps
- Blue/White light which is closer to natural daylight - compared to a yellow light produced by a halogen bulb
- Improved night time driving visibility - xenon lamps produce a wider and brighter beam in front of the vehicle than conventional halogen bulbs
- Lower running temperatures
- Lower power consumption.

The xenon headlamp is a self contained unit located within the headlamp assembly. The unit comprises a reflector, an adaptor ring, the lens, a shutter controller and the xenon bulb, which as an assembly is known as the projector module.

The reflector is curved and provides the mounting for the xenon bulb. The bulb locates in a keyway to ensure correct alignment in the reflector and is secured by two wire locking tabs. The bulb has a centrally mounted single pin and an outer ring which each connect with the contacts in the igniter.

The igniter is located on the rear of the bulb and is secured by pushing onto the bulb and rotating clockwise. The igniter has an electrical connector which can only be installed in the igniter socket once the igniter unit is attached to the bulb and is automatically ejected when the igniter is removed.

The shutter controller is a solenoid which operates the shutter mechanism via a lever. The shutter is used to change the beam projection from low beam to high beam and visa versa.

A tourist lever mechanism is located different sides of the projector module depending on market. This mechanism moves a flap to blank off a portion of the beam spread to enable the vehicle to be driven in opposite drive hand markets without applying blanking decals to the headlamp lens. The tourist function is operated by removing the access cover at the rear of the lamp assembly and pushing the tourist lever downwards.

⚠ WARNING: Make sure that the headlamps are off before removing the access cover.

The xenon bulbs illuminate when an arc of electrical current is established between two electrodes within the bulb. The xenon gas sealed in the bulb reacts to the electrical excitation and the heat generated by the current flow to produce the blue/white light.

To operate at full efficiency, the xenon bulb goes through three stages of operation before full output for continuous operation is achieved. The three phases are; start-up phase, warm-up phase and continuous phase.

In the start-up phase, the bulb requires an initial high voltage starting pulse of up to 30000 volts to establish the arc. This is produced by the igniters. The warm-up phase begins once the arc is established. The xenon control modules regulate the supply to the bulbs to 2.6A which gives a lamp output of 75W. During this phase, the xenon gas begins to illuminate brightly and the environment within the bulb stabilises ensuring a continual current flow between the electrodes. When the warm-up phase is complete, the xenon control modules change to continuous phase. The supply voltage to the bulb is reduced and the operating power required for continual operation is reduced to 35W. The process from start-up to continuous phase is completed in a very short time.

The xenon system is controlled by the CJB, the two xenon control modules and the two igniters. The xenon control modules (one per headlamp) receive an operating voltage from the CJB when the headlamps are switched on. The modules regulate the power supply required through the phases of start-up.

The igniters (one per headlamp) generate the initial high voltage required to establish the arc. The igniters have integral coils which generate high voltage pulses required for start-up. Once the xenon bulbs are operating, the igniters provide a closed circuit for regulated power supply from the control modules.

Turn Signal Indicator Lamp

The turn signal indicator lamp is incorporated into the outer part of the headlamp assembly. The lamp is located above the side lamp/cornering lamp. The turn signal indicator lamp uses a PY21W bayonet orange colored bulb in ROW markets, a S8W 27/7W wedge bulb is used in NAS markets.

The bulb is fitted into a holder which connects with contacts in the headlamp housing. The holder is fitted into an aperture in the headlamp housing and rotated to lock into position. The cover is secured in the housing by rotating in a clockwise direction until locked. Access to the cover requires removal of the headlamp from the front carrier assembly and removal of the outer locking plate from the headlamp.

The turn signal lamps are operated by the left hand steering column multifunction switch or by the hazard flasher switch. The steering column multifunction switch is only active with the ignition switch in the ignition position (II), the hazard flasher switch is active at all times. When active, the turn signal lamps will flash at a frequency cycle of 380ms on and 380ms off.

If a bulb fails, the remaining turn signal lamps bulbs continue to flash at normal speed. The turn signal indicators in the instrument cluster will flash at double speed to indicate the bulb failure to the driver.

Side Lamp

The side lamp is incorporated into the outer part of the headlamp assembly and is located below the turn signal indicator lamp. The side lamp shares the same housing and reflector as the cornering lamp and static bending lamp (when fitted).

The side lamp uses a W5W wedge fitting bulb which locates into a holder which is connected via wires to the main connector on the headlamp housing. The holder is a push fit into a receptacle in the headlamp housing. The bulb is accessible via a removable cover on the base of the headlamp housing. Access to the cover requires removal of the headlamp from the front carrier assembly.

The side lamps are operated by selecting side lamps or headlamps on the lighting control switch. The side lamps are operational at all times and are not dependant on the ignition switch position. The side lamps will also be illuminated when the lighting control switch is in the AUTO position and a 'lights on' signal is received by the CJB from the rain/light sensor.

Cornering Lamp

- NOTE: The cornering lamps are not fitted to NAS vehicles

The cornering lamps are an optional feature designed to illuminate the direction of travel when cornering at low speeds. The design of the lens projects a spread of light from the vehicle at approximately 45 degrees to the vehicle axis.

The cornering lamp is incorporated into the outer part of the headlamp assembly and shares the same housing and reflector as the side lamp.

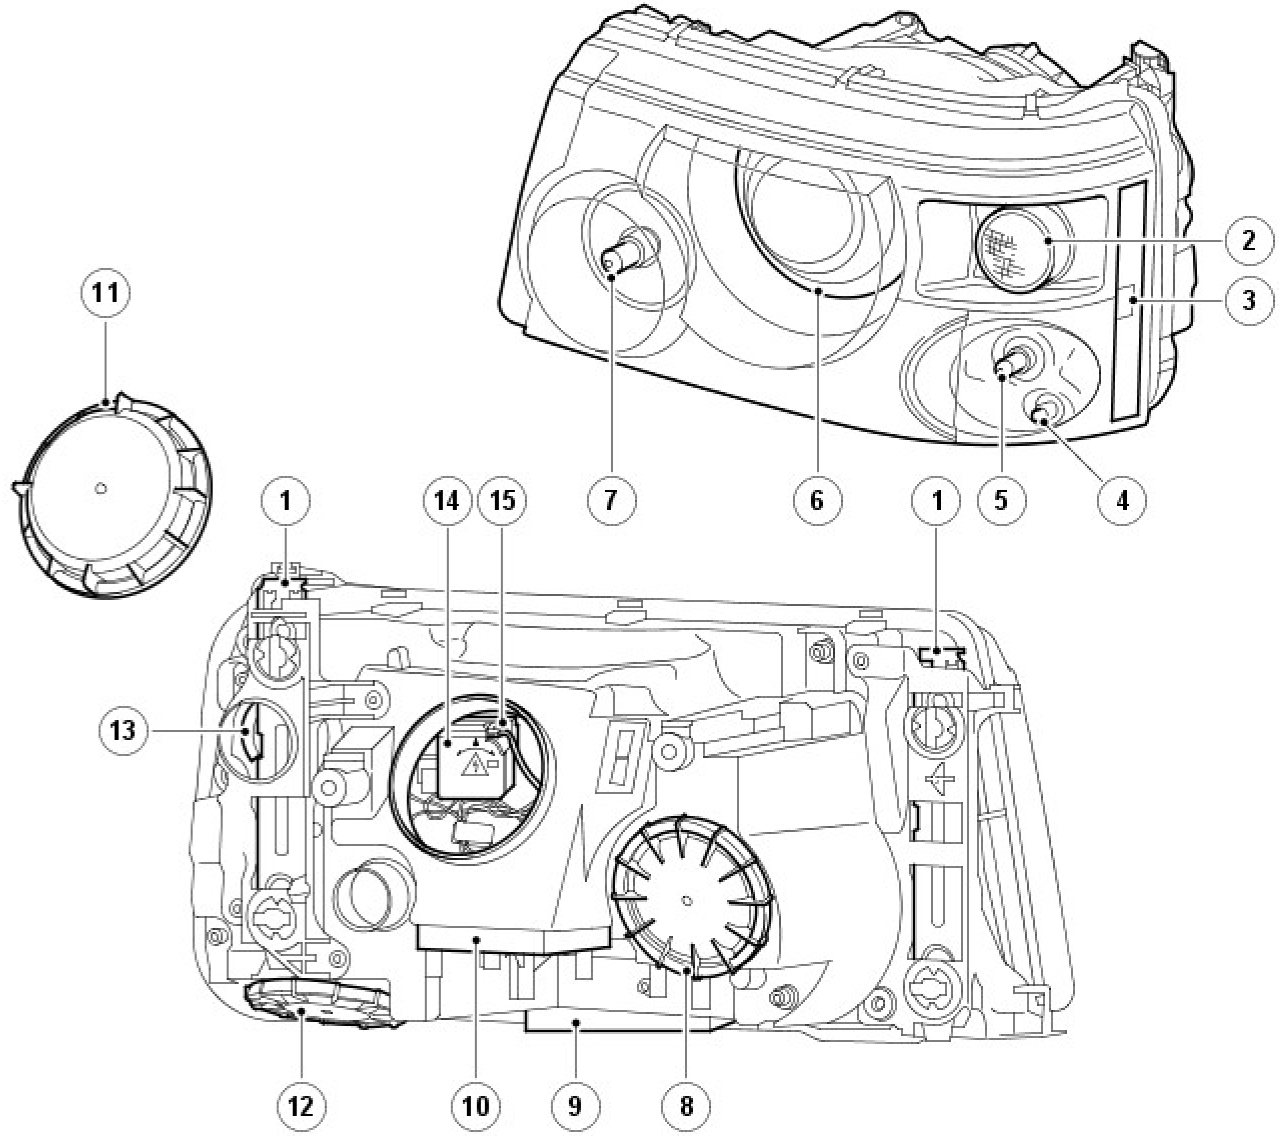
The cornering lamp uses a 35W Halogen H8 bulb which is permanently located in an integral holder which is connected on the headlamp housing. The holder is located in an aperture in the headlamp housing and rotated to lock. The bulb is accessible via a removable cover on the base of the headlamp housing.

The cornering lamps are controlled by the left hand steering column multifunction switch with the lighting control switch in the headlamp position and the ignition switch in position II. The cornering lamps are supplied power via the ignition switch to ensure that they do not function with the headlamp delay feature. The cornering lamps are deactivated if the vehicle speed exceeds 25 mph (40 km/h).

Only one cornering lamp will illuminate at any one time. If the left hand turn signal indicators are selected on, the left hand cornering lamp will be illuminated and visa versa, providing the vehicle speed and lighting control switch positions are correct.

ADAPTIVE FRONT LIGHTING SYSTEM (AFS)

Xenon Headlamp Assembly with AFS



E57835

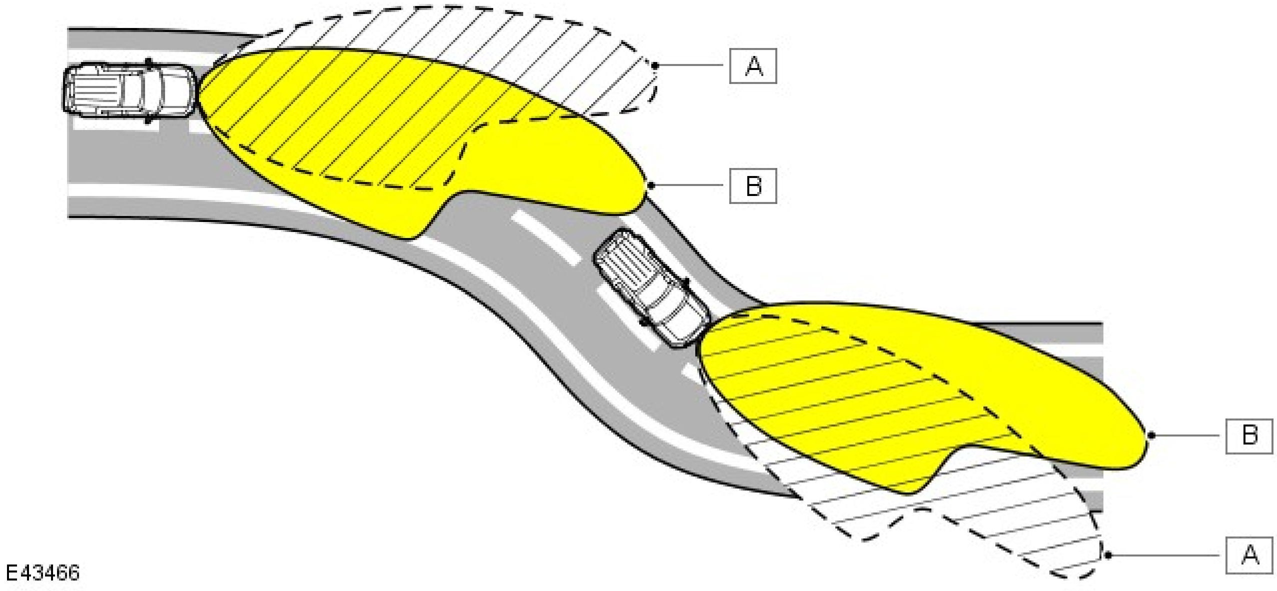
Item	Part Number	Description
1	-	Locking plate
2	-	Turn signal indicator lamp
3	-	Side marker lamp (NAS only)
4	-	Side lamp
5	-	Static bending lamp (All except NAS)
6	-	Xenon low/high beam AFS lamp
7	-	Halogen high beam lamp
8	-	High beam lamp access cover
9	-	Xenon control module
10	-	AFS power control module
11	-	Low/high beam lamp access cover
12	-	Side lamp and static bending lamp access cover (hidden)
13	-	Turn signal indicator lamp access cover (hidden)
14	-	Igniter
15	-	Igniter connector

The AFS is a system to improve driver visibility under differing driving conditions. AFS provides a larger visible area which is illuminated when cornering by adjusting the position of the beam distribution on the road. Horizontal adjustment is made automatically to the most suitable orientation for the driving conditions using steering angle and information from other vehicle sensors.

AFS is only available with xenon headlamps and also includes the dynamic headlamp leveling system described in the 'Headlamp Leveling' section of this document. The bi-xenon module within the headlamp is controlled by actuator motors which rotate the projector module on its vertical and horizontal axes to adjust the beam output to suit the cornering conditions and vehicle inclination. Only the bi-xenon lamp projector module swivels, the halogen high beam lamp unit remains static.

The AFS is controlled by an AFS control module which is located at the bottom of the 'A' pillar, behind the CJB. The AFS control module is connected to and controls an AFS power module located on the base of each headlamp. Signals from the AFS control module are processed by the AFS power module which powers stepper motors to adjust the vertical and horizontal alignment of the xenon projector module. The AFS power module also controls and regulates the operation of the static bending lamp (if fitted) which is requested by the AFS control module but controlled by the CJB.

AFS Concept



A	Conventional headlamp beam distribution
B	AFS swivel headlamp beam distribution

AFS Control Module

The AFS control module is a dual functionality unit which also incorporates software to control the dynamic headlamp leveling. The AFS control module is connected to the high speed CAN bus and receives inputs from other vehicle systems on the status of the following parameters:

- Steering angle
- Vehicle speed
- Headlamp status
- Engine running
- Reverse gear selected
- Automatic lighting on.

The AFS will only operate when the AFS control module receives an engine running signal on the CAN bus. When the engine running signal is received the AFS control module performs an initialisation routine.

The AFS will also function when the lighting control switch is in the AUTO position and the AFS control module receives a lights on signal from the rain/light sensor and an engine running signal.

The AFS control module then monitors the inputs from the other vehicle systems to control the AFS functionality according to cornering angles and vehicle speed.

The AFS control module is connected to each AFS power module on a private LIN bus. The power modules read operating values supplied from the AFS control module and control the output drivers for the stepper motor actuators inside the headlamp assembly.

AFS Control Module Connector C2193 Pin Details

Pin No.	Description	Input/Output
1	Not used	-

Pin No.	Description	Input/Output
2	CAN high	Input/Output
3	CAN low	Input/Output
4	Shield ground	Input
5	Private LIN bus serial interface to AFS power modules	Input/Output
6 to 22	Not used	-
23	Ignition power supply	Input
24	Ground	Input
25	Not used	-

AFS Operation

The AFS controls the swiveling angle of each projector module using speed and steering angle signals. The angles of each projector module differ to give the correct spread of light, e.g. when turning left, the left hand projector module will have a greater swiveling angle than the right hand projector module.

Xenon Headlamp Assembly with AFS Construction

The AFS xenon headlamp construction is similar to the non-AFS xenon headlamp assembly. The AFS assembly contains an additional carrier frame which provides the location for the AFS actuators. The remaining lamps are as described previously for the xenon headlamp assembly. The functionality of the static bending lamp on the AFS headlamp is different from the functionality of the cornering lamp on the xenon headlamp.

The carrier frame is attached to the AFS vertical actuator. The projector module has a central pivot point which allows the module to move horizontally in response to operation of the AFS horizontal actuator.

The AFS actuators are bi-polar (2 phase) dc stepper motors which are driven by a power output from the AFS power module. Each stepper motor receives its position information from the AFS control module via the applicable AFS power module. When the actuators are powered to their requested positions, a holding current is applied to maintain the actuator position.

The actuators do not supply a positional feedback signal to the AFS control module. Each stepper motor requires referencing each time the AFS system becomes active. When the AFS system is active, each vertical actuator is driven in the low beam position and each horizontal actuator is driven to an inboard position until a mechanical stop in the actuator is reached. Once the stop is reached a step counter in the AFS control module is set to zero and the actuator is then powered to the operating position as determined by the AFS control module software.

The AFS control module receives front and rear suspension height data to provide dynamic headlamp leveling adjustment via the vertical actuator motor. The AFS control module also receives vehicle speed signals from the ABS module to adjust the projector module vertically to increase the beam range as the vehicle speed increases.

Initialisation Procedure

When the AFS control module receives an ignition on signal, the control module performs the initialisation procedure which ensures that the headlamps are correctly aligned on both their vertical and horizontal axes.

The headlamp leveling initialisation takes less than 3 seconds to complete. The headlamp leveling motors are powered from their current position, which can be either the upper or lower limit or somewhere in between, to their lower position and then back to the 0 degrees position.

The AFS swivel initialisation starts less than 1 second after the headlamp leveling initialisation is activated to ensure that the headlamps are at or below the 0 degree position in the vertical axis, thus preventing glare to oncoming vehicles. The AFS swivel initialisation is completed in less than 2.5 seconds. The LH and RH AFS actuator motors are powered from the 0 degree position to their fully inboard position, then to their fully outboard position and then back to the 0 degree position.

Failure Mode

In the event of a failure of the AFS system, a warning indicator in the instrument cluster is illuminated to warn the driver. The AFS warning indicator illuminates when the ignition switch is in position (II) and will flash continuously until the fault is rectified. The AFS warning indicator will also be illuminated if a failure of the steering angle sensor or the vehicle speed signal is detected.

Illumination of the AFS warning indicator does not necessarily mean that there is a fault with the AFS system. The fault may be caused by a failure of another system preventing the AFS system operating correctly.

The AFS control module performs a diagnostic routine every time AFS is requested. If any fault is found, the AFS control module will suspend the operation of the AFS function.

If the AFS leveling system has failed with the xenon projector module in a position other than the correct straight ahead position, the AFS control module will attempt to drive the projector module to a position a small amount lower than the standard position. If the swivel function has failed, the AFS control module will lower the projector module using the leveling actuator motors to a position much lower than standard to prevent excess glare to oncoming vehicles.

The AFS control module software can detect an internal failure of the control module control circuits. The control module will power the projector modules to the zero position and prevent further operation.

Faults can be investigated by interrogating the AFS control module using T4 to check for fault codes.

Static Bending Lamps

• NOTE: The static bending lamps are not fitted to NAS vehicles

The static bending lamps, which are a standard feature on AFS headlamps, are designed to illuminate the direction of travel when cornering at low speeds. The static bending lamp functionality, which controlled by the CJB, is unique to vehicles with AFS headlamps and operates using inputs from the steering angle sensor.

The static bending lamp is incorporated into the outer part of the headlamp assembly and shares the same housing and reflector as the side lamp. The design of the lens projects a spread of light from the vehicle at approximately 45 degrees to the vehicle axis.

The static bending lamp uses a 35W Halogen H8 bulb which locates in a holder which is connected via wires to the main connector on the headlamp housing. The holder is located in an aperture in the headlamp housing and rotated to lock. The bulb is accessible via a removable cover at the rear of the headlamp housing.

AFS Control

The static bending lamps operate with a steering angle sensor CAN signal which is received by the AFS control module and the CJB. The AFS control module sends a static bending lamp on request to the CJB which activates the static bending lamp bulb.

When the operation parameters of the lamp are reached, the CJB fades the static bending lamp bulb on using a PWM voltage over a period of approximately 2 seconds. When the lamp is switched off, the CJB fades the bulb off by decreasing the PWM voltage in a linear manner depending on steering angle and vehicle speed.

AUTOMATIC HEADLAMP OPERATION

The automatic headlamp function is a driver assistance system. The driver can override the system operation by selection of side lamp or headlamp on if the ambient light conditions require front and rear lighting to be active. The automatic headlamp system uses a light sensor and the CJB, which are connected via the LIN bus to control the headlamp functionality.

A light sensor is incorporated in the rain/light sensor located on the inside of the windshield, below the rear view mirror. The wiper system also uses the rain/light sensor for automatic wiper operation.
For additional information, refer to: Wipers and Washers (501-16 Wipers and Washers, Description and Operation).
The light sensor measures the ambient light around the vehicle in a vertical direction and also the angular light level from the front of the vehicle. The rain/light sensor uses vehicle speed signals, wiper switch position and the park position of the front wipers to control the system.

The automatic headlamp operation uses ambient light levels which are monitored by photodiode incorporated in the rain/light sensor. The rain/light sensor sends a lights on/off request to the CJB on the LIN bus, which responds by switching on the low beam headlamps, front side lamps and rear tail lamps.

The automatic headlamps are activated under the following conditions:

- Twilight
- Darkness
- Rain
- Snow
- Tunnels
- Underground or multistoried car parks.

Operation of the automatic headlamps requires the ignition switch to be in position II, the lighting control switch to be in the 'AUTO' position and a lights on request signal from the light sensor. If the rain sensor signal activates the wipers fast speed wipers, the low beam headlamps are activated, providing the lighting control switch is in the 'AUTO' position.

HEADLAMP LEVELING

Headlamp leveling provides for the adjustment of the vertical aim of the headlamps. The leveling system is primarily required to minimise glare to other road users when a heavy load is in the rear of the vehicle.

Two systems of headlamp leveling are available; static and dynamic.

Static Vehicle Headlamp Leveling

Static vehicle headlamp leveling is performed by the air suspension system and the air suspension control module. The suspension system constantly monitors the vehicle attitude and adjusts the height of the front and/or rear of the vehicle accordingly. This maintains the correct vehicle attitude and consequently maintains the correct headlamp beam alignment.

The vehicle leveling system is fully automatic, therefore the lighting control switch does not have a manual leveling rotary control.

Dynamic Headlamp Leveling (Air Suspension)

Dynamic headlamp leveling is only available on vehicles with the AFS.

The dynamic headlamp leveling adjusts the vertical alignment of the headlamps as a rapid response to changes in vehicle attitude due to acceleration or braking.

The dynamic system is fully automatic, therefore the lighting control switch does not have a manual leveling rotary control.

• NOTE: The AFS system also operates in conjunction with the vehicle leveling system as described previously.

The dynamic system comprises the following components:

- Two headlamp leveling motors
- AFS control module
- Engine running signal from engine control module
- Vehicle speed information from ABS module
- Vehicle height information from air suspension control module.

When the ignition switch is in position (II), power is supplied to the lighting control switch via the ignition relay in the Battery Junction Box (BJB) and to the AFS control module. When the lighting control rotary switch is moved to the side lamp or headlamp position, the supply from the ignition relay is passed to the AFS control module.

• NOTE: When the AFS control module receives an ignition on signal, the control module performs an initialisation procedure for both the AFS and headlamp leveling motors. Refer to the previous AFS section for details of the initialisation procedure.

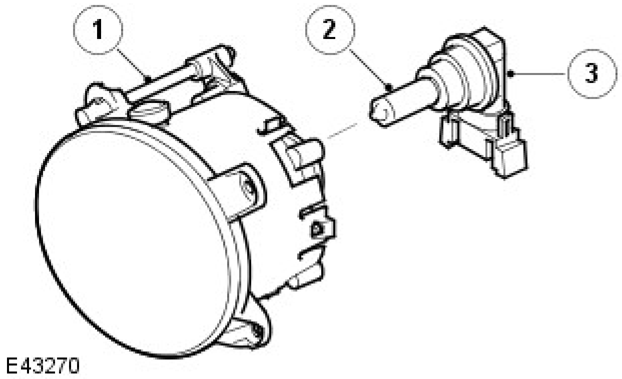
The system operates by the AFS control module receiving inputs on the CAN from the air suspension control module for front and rear vehicle height, from the engine control module for engine running signal and from the ABS module for stop lamp switch active (brakes applied) and vehicle speed. The AFS control module processes these signals and provides an output to the headlamp leveling motors to adjust the headlamp vertical aim according to vehicle speed and attitude.

• NOTE: In markets with Daytime Running Lamps (DRL), the dynamic headlamp leveling system will not operate when the DRL are active.

DAYTIME RUNNING LAMPS (DRL)

Refer to the Daytime Running Lamps section for details.
For additional information, refer to: Daytime Running Lamps (DRL) (417-04 Daytime Running Lamps (DRL), Description and Operation).

FRONT FOG LAMP (If Fitted)



Item	Part Number	Description
1	-	Adjuster screw
2	-	Halogen bulb
3	-	Bulb holder

Front fog lamps are an optional fitment on low specification vehicles and a standard fitment on high specification vehicles.

Two front fog lamps are located in apertures in the front bumper. Each lamp is secured in the bumper with three screws which are covered with a finisher. The fog lamp has an adjuster screw which is accessible by removal of the lamp surround and is used to set the fog lamp to the correct alignment.

The fog lamp uses a 55W halogen H11 bulb which is located in a holder. The holder is located in a hole in the rear of the fog lamp housing and is turned to lock in position.

The front fog lamps are controlled by the lighting control switch. When the ignition switch is in the ignition position (II) and the lighting control switch is in the side lamp or headlamp position, the lighting control switch can be pulled to the first position to activate the front fog lamps.

If the switch is pulled to the second position, the front and rear fog lamps are activated. A front fog lamp warning indicator is illuminated in the instrument cluster when the front fog lamps are active.

Front Fog Lamps Functionality (NAS and Canadian Markets Only)

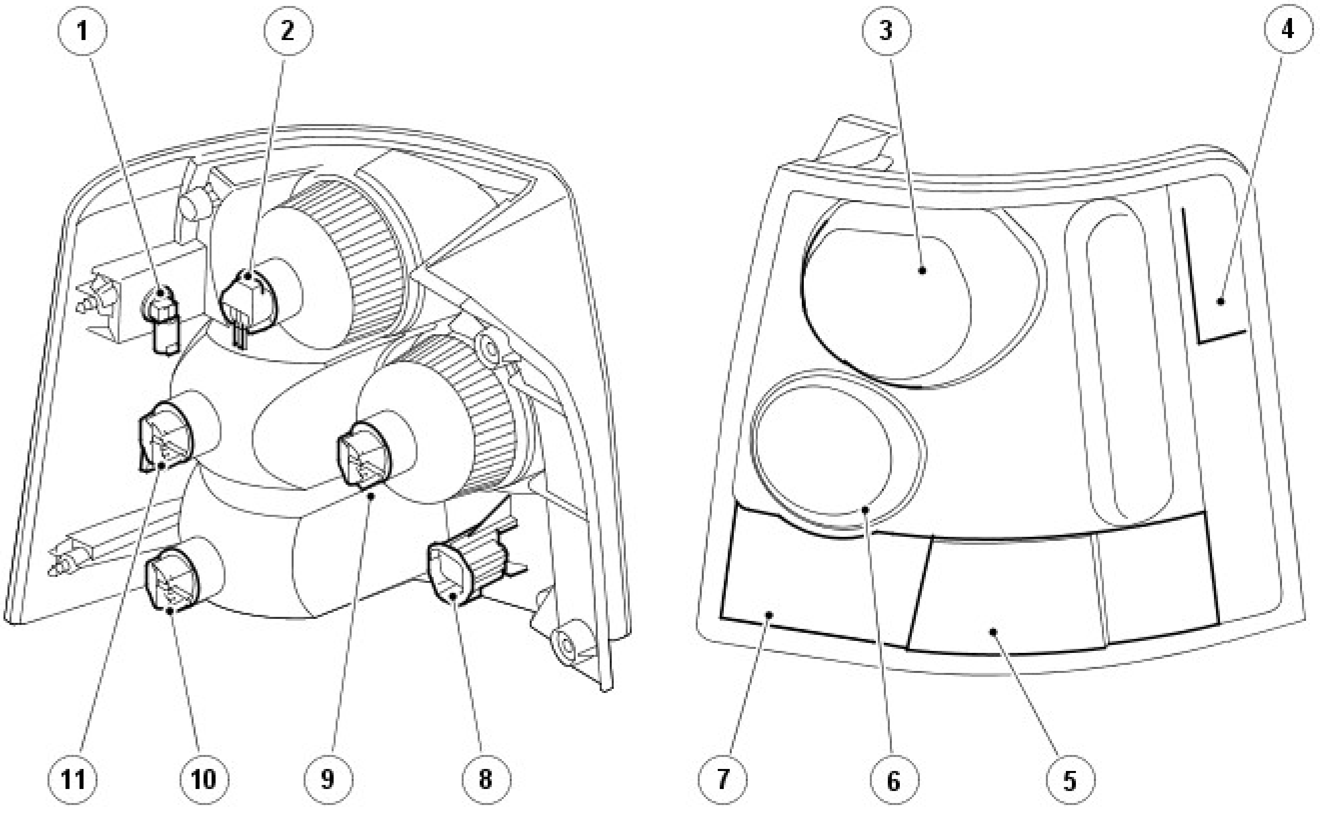
The front fog lamps are powered by an additional relay (relay 5) which is located in the BJB in the engine compartment.

The front fog lamps operate as described previously but with the following differences which cover local laws governing lamp usage.

If the low beam headlamps and the front fog lamps are on at the same time, when the high beam headlamps are switched on, the front fog lamps will be automatically switched off. When the high beam headlamps are switched off, the front fog lamps will be switched back on automatically.

- NOTE: The front fog lamps will also be switched off if the headlamp high beam flash function is operated.

REAR LAMP ASSEMBLY



E57837

Item	Part Number	Description
1	-	Side marker lamp bulb (NAS only)
2	-	Stop/side lamp bulb
3	-	Stop/side lamp
4	-	Side marker lamp (NAS only)
5	-	Fog lamp
6	-	Reverse lamp
7	-	Reflector
8	-	Electrical connector
9	-	Reverse lamp bulb
10	-	Fog lamp bulb
11	-	Turn signal indicator lamp bulb

The rear lamp assembly is a one piece unit which contains a stop/tail lamp, a turn signal lamp, a reversing lamp and a fog lamp. Five bayonet fitting bulbs are used (six on NAS vehicles with the addition of a side marker lamp). These are located in holders which fit into the applicable hole in the lamp housing and are locked by rotating. Each bulb holder is connected by wires to a connector on the rear of the lamp housing.

The rear lamp assembly is located in a recess in the vehicle body. Two studs on the outer edge of the lamp housing locate in the vehicle body. The lamp is secured with two screws which are located on the inner edge of the lamp housing, near the tailgate aperture.

Rear Stop and Side Lamp

The upper lamp is a combined stop and tail lamp and uses a 21W/5W bayonet fitting bulb. The stop lamp uses the 21W bulb filament and the side lamp uses the 5W bulb filament.

The stop lamp is activated when the ignition switch is in the ignition position (II) and the brake pedal switch is active (by depressing the brake pedal). The high mounted stop lamp will also be activated when the brake pedal is pressed.

The stop lamps can also be activated by the ABS when Hill Descent Control (HDC) is active. A signal from the ABS module energises a relay which supplies power to the stop lamps and high mounted stop lamp.
For additional information, refer to: Anti-Lock Control - Traction Control (206-09A Anti-Lock Control - Traction Control, Description and Operation).

The side lamps are operated by selecting side lamps or headlamps on the lighting control switch. The side lamps are operational at all times and are not dependant on the ignition switch position. The side lamps will also be illuminated when the lighting control switch is in the AUTO position and a 'lights on' signal is received by the CJB from the rain/light sensor.

Turn Signal Indicator Lamp

The turn signal indicator lamp is located below the stop/tail lamp and uses a 21W bayonet fitting bulb.

The turn signal indicator lamps are operated by the left hand steering column multifunction switch or by the hazard flasher switch. The steering column multifunction switch is only active with the ignition switch in the ignition position (II), the hazard flasher switch is active at all times. When active, the turn signal indicator lamps will flash at a frequency cycle of 380ms on and 380ms off.

If a bulb fails, the remaining turn signal indicator lamp bulbs on that side of the vehicle flash at normal speed. The applicable turn signal indicator in the instrument cluster will flash at double speed to alert the driver to the bulb failure.

Reversing Lamp

The reversing lamp is located adjacent to the turn signal lamp and uses a 21W bayonet fitting bulb.

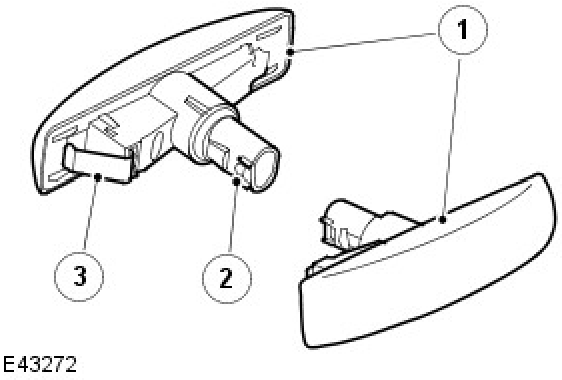
The reversing lamp is active when the ignition switch is in the ignition position (II) and the CJB receives a reverse selected signal on the CAN bus. The automatic transmission has a reverse switch which senses when reverse is selected.

Rear Fog Lamp

The rear fog lamp is located at the bottom of the rear lamp and uses a 21W bayonet fitting bulb.

The rear fog lamp is controlled by the lighting control switch. When the ignition switch is in the ignition position (II) and the lighting control switch is in the side lamp or headlamp position, the lighting control switch can be pulled to the second position (if front fog lamps fitted) to activate the front fog lamps. If front fog lamps are not fitted, the switch need only be pulled to the first position. A rear fog lamp warning indicator is illuminated in the instrument cluster when the rear fog lamps are active.

TURN SIGNAL INDICATOR REPEATER LAMP

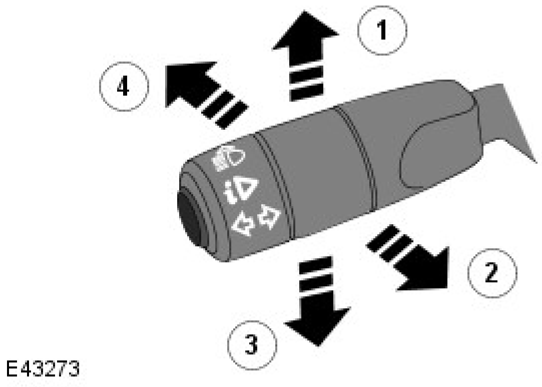


Item	Part Number	Description
1	-	Turn signal indicator repeater lamp
2	-	Bulb holder
3	-	Clip

The repeater lamps are located in the driver and passenger doors, below each door mirror. The lamps are clipped into an aperture in the door panel and can be removed by sliding rearwards and releasing the front edge of the lamp from the door. The repeater lamps use a 5W capless bulb which is located in a holder.

The repeater lamps have the same functionality as the front and rear turn signal indicator lamps and are operated by the left hand steering column multifunction switch or by the hazard flasher switch. The steering column multifunction switch is only active with the ignition switch in the ignition position (II), the hazard flasher switch is active at all times. When active, the repeater lamps will flash at a frequency cycle of 380ms on and 380ms off. If a lamp bulb fails, the remaining turn signal indicator lamp bulbs continue to flash at the normal rate.

LEFT HAND STEERING COLUMN MULTIFUNCTION SWITCH



Item	Part Number	Description
1	-	RH turn signal indicator lamp
2	-	Headlamp flash
3	-	LH turn signal indicator lamp
4	-	Headlamp high beam

The steering column multifunction switch is located on the left hand side of the steering column and controls the following functions:

- Headlamp low/high beam
- Headlamp high beam flash
- Left/right turn signal indicator lamps
- Trip computer functions.
  For additional information, refer to: Information and Message Center (413-08 Information and Message Center, Description and Operation).

The high beam on and flash functions are connected on separate wires to the CJB. When the switch is operated in either position a ground path is completed which is sensed by the CJB which activates the selected function.

The turn signal indicator lamps are connected and operate in a similar way with the ground path completed through a separate wire which is sensed by the CJB which activates the applicable turn signal indicator lamps.

HAZARD FLASHERS

The hazard flashers are controlled by a non-latching switch in the centre of the instrument panel. The hazard flashers operate at all times when selected and are not dependant on ignition switch position.

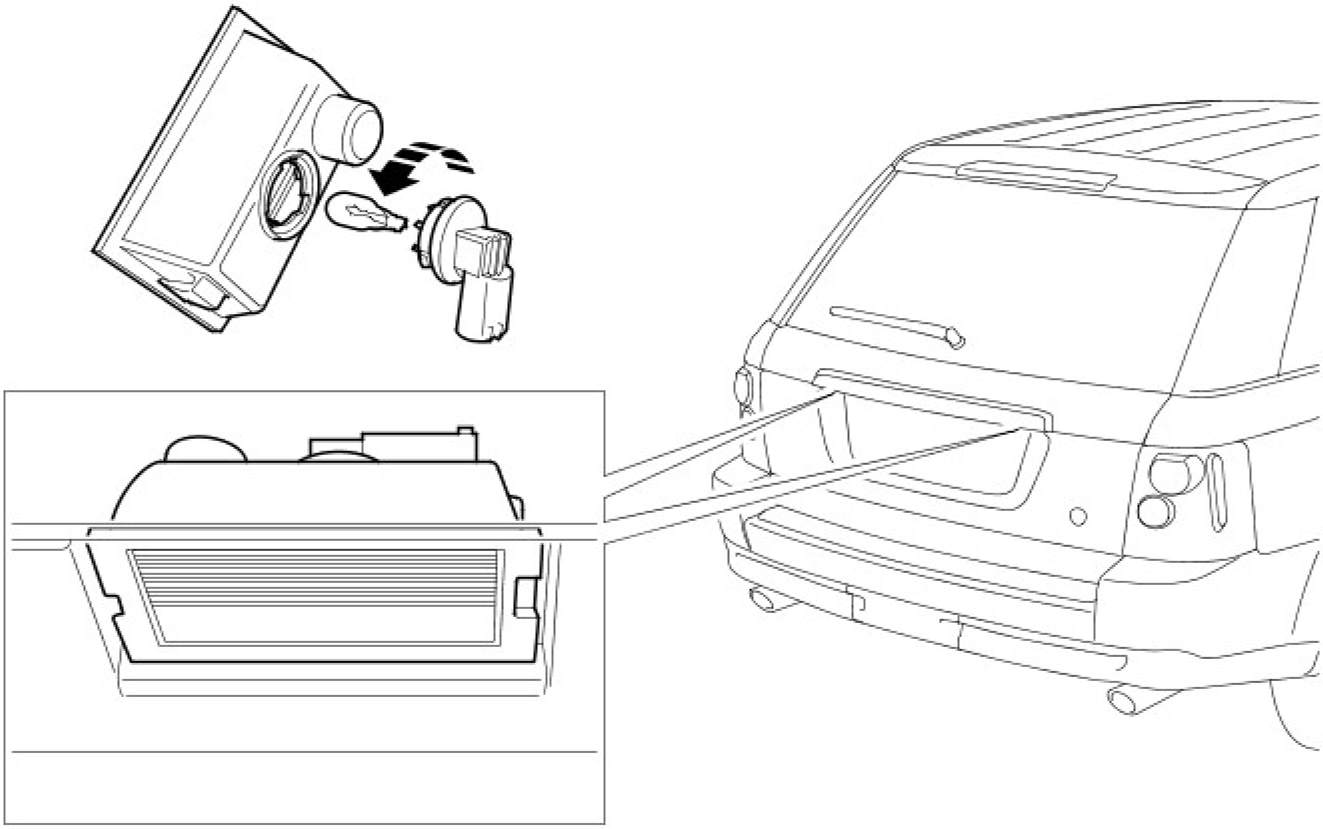
When the hazard flashers are selected on, all of the front, rear and side turn signal indicator lamps operate as previously described and both left and right turn signal indicators in the instrument cluster also flash. The hazard warning flashers flash at a rate of 380ms on and 380ms off. When the hazard flashers are active, they override any request for turn signal lamp operation.

If a trailer is fitted, the trailer turn signal lamps will flash at the same frequency as the vehicle indicators. The trailer warning indicator in the instrument cluster will also flash. If a trailer bulb is defective, the trailer warning indicator will not flash.

The hazard flashers can also be activated by a crash signal from the restraints control module. This is received by the CJB which activates the hazard flashers. The hazard flashers can be cancelled by moving the ignition switch to the auxiliary position I or the off position O or the crash mode is cancelled by the restraints control module.
For additional information, refer to: Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) (501-20B

Supplemental Restraint System, Description and Operation).

LICENSE PLATE LAMPS

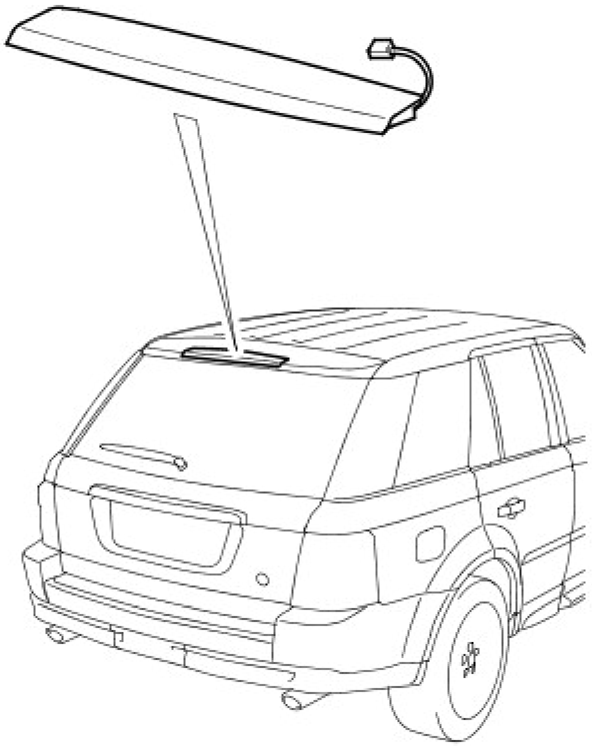


E57838

Two license plate lamps are fitted in the tailgate handle, above the license plate in the upper tailgate. Each lamp uses a 5W capless type bulb. The lamps are secured in the upper tail gate handle with integral clips. The lamps can be released from the handle using a small, flat blade screwdriver.

The license plate lamps are active at all times when the side lamps or headlamps are switched on.

HIGH MOUNTED STOP LAMP



E57839

The high mounted stop lamp is located in the tailgate spoiler.

The lamp comprises a plastic housing with a red coloured lens. The lamp is illuminated by 24 Light Emitting Diodes (LED's).

The high mounted stop lamp is activated, along with the tail lamp stop lamps, when the ignition switch is in the ignition position (II) and the brake pedal switch is active (by depressing the brake pedal).

The high mounted stop lamp and the stop lamps can also be activated by the ABS when Hill Descent Control (HDC) is active. A signal from the ABS module energises a relay which supplies power to the stop lamps.
For additional information, refer to: Anti-Lock Control - Traction Control (206-09A Anti-Lock Control - Traction Control, Description and Operation).

TRAILER LIGHTING

Several different types of trailer socket can be fitted to the vehicle depending on market specifications. Refer to the Electrical Reference Library for specific socket details.

The CJB monitors the turn signal lamps and can detect if more than two lamps are fitted (the side turn signal lamps are not monitored). When a trailer is detected, the trailer warning indicator in the instrument cluster will flash in synchronisation with the turn signal indicators.

If one or more of the turn signal lamps on the vehicle or the trailer are defective, the trailer warning indicator will not flash to alert the driver to the bulb failure.

DIAGNOSTICS

The diagnostic socket is located in the lower instrument panel closing panel, on the driver's side, below the steering column. Various lighting system functions are monitored by different systems which can store fault information. This can be retrieved using T4 or other suitable scan tool.

Central Junction Box (CJB)

The CJB monitors the status of the lighting circuits, relays and switches. If a fault occurs, the CJB stores a fault code applicable to the specific fault which can be retrieved using T4 or other suitable scan tool.

CONTROL DIAGRAM

- NOTE: **A** = Hardwired; **N** = CAN Bus; **O** = LIN Bus; **R** = SPDIF

Exterior Lighting - Headlamps

Diagnosis and Testing

Principles of Operation

For a detailed description of the exterior lighting system, refer to the Description and Operation section 417-00 - Exterior Lighting of the workshop manual.

Overview

Three types of Headlamp are available: Halogen, Bi-Xenon or Adaptive Front Lighting System (AFS).

Given the potential for personal injury, the following safety information should be followed at all times:

Safety Information

- WARNINGS:

The Xenon Headlamp system generates up to 28,000 volts. Make sure that the headlamps are switched off before working on the system. Failure to follow this instruction may lead to fatality.

The following safety precautions must be followed when working on the Xenon Headlamp System:

- DO NOT attempt any procedures on the Xenon Headlamps or circuits when the system is energized.
- Handling of the Xenon bulb must be performed using suitable protective equipment, e.g. gloves and goggles. The glass part of the bulb must not be touched.
- Only operate the lamp in a mounted condition in the reflector.
- All safety procedures and precautions must be followed to prevent personal injury.

CAUTION: Xenon bulbs must be disposed of as hazardous waste.

There are instructions on the correct procedures for Xenon Headlamp System repairs in the manual, refer to section 100-00 - General Information, Standard Workshop Practices of the workshop manual.

Inspection And Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. **1.** Verify the customer concern.
    - Note that intermittent fault reports may be due to the cycling operation of the field effect transistors (FETs)
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual Inspection

Mechanical	Electrical
Headlamp(s) condition and installation Bulb(s) and installation Bulb holder(s) and installation Lighting control switch and installation Left-hand Steering Column Multifunction Switch and installation	Fuses Relays Wiring harness Loose or corroded connector(s) Battery junction box (BJB) Central junction box (CJB) Adaptive Front Lighting System (AFS) module Headlamp Power modules Instrument Cluster (IPC) Steering Angle Sensor Module (SASM) Transmission Control Module (TCM) Engine Control Module (ECM) Air Suspension Control Module Communication BUS circuits Controller area network (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to

the next step.

4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Because the DTCs are stored in more than one module, a complete vehicle read is recommended
    - Make sure that all DTCs are cleared following rectification

Symptom Chart

Symptom	Possible Causes	Action
Low beam lamp(s) inoperative	Bulb failure Fuse(s) blown Circuit fault Lighting control switch fault Left-hand steering column multifunction switch fault	Check the bulb and fuse condition (see visual inspection). Check the headlamp circuits. Check the lighting control switch function. Check the left-hand steering column multifunction switch operation. Refer to the electrical guides. Check for DTCs indicating a headlamp or related circuit fault.
High beam lamp(s) inoperative		
Low beam lamp(s) dim	Incorrect bulb rating Tourist lever set in the wrong position Circuit fault Lighting control switch fault Left-hand steering column multifunction switch fault	Check the bulb condition and rating. Check the tourist lever is set correctly. Check the headlamp circuits. Check the lighting control switch function. Check the left-hand steering column multifunction switch function. Refer to the electrical guides.
High beam lamp(s) dim		
Low beam lamp(s) stuck on	Circuit fault Lighting control switch fault Left-hand steering column multifunction switch fault Headlamp timer function fault	Check the headlamp circuits. Check the lighting control switch function. Check the left-hand steering column multifunction switch operation. Check the headlamp timer function. Refer to the electrical guides. Check for DTCs indicating a headlamp circuit fault
High beam lamp(s) stuck on		
Headlamp low/high beam switching function inoperative	Circuit fault Left-hand steering column multifunction switch fault Xenon lamp shutter mechanism fault	Check the headlamp circuits. Check the left-hand steering column multifunction switch operation. Check the Xenon lamp shutter mechanism operation. Refer to the electrical guides. Check for DTCs indicating a headlamp circuit fault
Warning lamp(s) inoperative	Fuse(s) blown Lighting control switch fault Left-hand steering column multifunction switch inoperative Circuit fault Instrument cluster fault	Check the fuse(s) (see visual inspection). Check the lighting control switch function. Check the left-hand steering column multifunction switch function. Check the warning lamp circuits. Refer to the electrical guides. Check for DTCs indicating an instrument cluster or CAN system fault.
Headlamp Wet - Internal	Condensation Water Ingress	Check for outstanding Technical Service Bulletins (TSBs) relating to 'Headlamp Internal Condensation'. Carry out the instructions in the service bulletin to determine if the fault is related to condensation or water ingress.

DTC Index

Adaptive Front Lighting System (AFS) Control Module

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

- NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

- NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

- NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

- NOTE: Prior to installation/replacement of the Headlamp Assembly carry out all relevant internal visual and mechanical checks for correct cable location and termination including: checks for corroded, bent or backed out pins or terminals, incorrectly inserted connectors and harness damage due to chaffing or incorrect routing.

- NOTE: If the control module has been removed and reinstalled, carry out a DTC code clear, cycle the ignition state to off, then on. This will erase any DTCs that have been logged during the module installation procedure

DTC	Description	Possible Causes	Action
B1A57-01	Left Headlamp Leveling Motor - General Electrical Failure	● Internal Headlamp Motor Fault ● Internal Headlamp Circuit Fault	Using the manufacturer approved diagnostic system perform an on demand self test (On Demand Self Test), look for any errors in movement (compare with other headlamp) and visually inspect the lamp for internal damage or dislocation (ball joints out). Refer to the electrical circuit diagrams and check for circuit fault between the Adaptive Front Lighting System (AFS) Control Module and the Headlamp Leveling Motor. If no mechanical or circuit faults are evident, suspect headlamp internal fault, replace as required. Refer to the new module/component installation note at the top of the DTC Index
B1A58-01	Right Headlamp Leveling Motor - General Electrical Failure	● Internal Headlamp Motor Fault ● Internal Headlamp Circuit Fault	Using the manufacturer approved diagnostic system perform an On Demand Self Test, look for any errors in movement (compare with other headlamp) and visually inspect the lamp for internal damage or dislocation (ball joints out). Refer to the electrical circuit diagrams and check for circuit fault between the Adaptive Front Lighting System (AFS) Control Module and the Headlamp Leveling motor. If no mechanical or circuit faults are evident, suspect headlamp internal fault, replace as required. Refer to the new module/component installation note at the top of the DTC Index
B1D66-00	Left Headlamp Power Module - No Sub-Type Information	● Headlamp Power Module Internal Fault ● Power supply fault	• NOTE: The power module is a service item This DTC is logged if the Headlamp Power Module supply voltage is above 16 volts / below 9.5 volts or the module suffers an internal failure. Record then clear the stored DTC, cycle the ignition state and check headlamp operation, if the DTC returns refer to the electrical circuit diagrams and check the power, ground and signal circuit of the Power Module for circuit fault. If no circuit faults are evident suspect the Headlamp Power Module has an internal fault, replace as required. Refer to the new module/component installation note at the top of the DTC Index
B1D67-00	Right Headlamp Power Module - No Sub-Type Information	● Headlamp Power Module Internal Fault ● Power supply fault	• NOTE: The power module is a service item This DTC is logged if the Headlamp Power Module supply voltage is above 16 volts / below 9.5 volts or the module suffers an internal failure. Record then clear the stored DTC, cycle the ignition state and check headlamp operation, if the DTC returns refer to the electrical circuit diagrams and check the power, ground and signal circuit of the Power Module for circuit fault. If no circuit faults are evident suspect the Headlamp Power Module has an internal fault, replace as required. Refer to the new module/component installation note at the top of the DTC Index
B1D66-91	Left Headlamp Power Module - Parametric	● Headlamp Power Module ● The parameter set of the Power Module does not match the Adaptive Front Lighting System (AFS) Module parameter set	• NOTE: The power module is a service item Clear the DTC. Turn the Headlamp Switch on, cycle the ignition state to start the engine, check for stored DTCs, if DTC returns suspect the Headlamp Power Module has an internal fault, replace as required. Refer to the new module/component installation note at the top of the DTC Index
B1D67-91	Right Headlamp Power Module - Parametric	● Headlamp Power Module ● The parameter set of	• NOTE: The power module is a service item Clear the DTC. Turn the Headlamp Switch on, cycle the ignition

DTC	Description	Possible Causes	Action
		the Power Module does not match the Adaptive Front Lighting System (AFS) Module parameter set	state to start the engine, check for stored DTCs, if DTC returns suspect the Headlamp Power Module has an internal fault, replace as required. Refer to the new module/component installation note at the top of the DTC Index
U3000-16	Control Module - Circuit voltage below threshold	● The power supply to the Module has been below 9 Volts for more than 1000 milliseconds	Suspect Battery or Charging fault. Check the battery condition and state of charge. Check the vehicle charging system. Refer to the relevant workshop manual section. Clear the DTC, cycle ignition state to off then on, if DTC returns refer to the electrical circuit diagrams and check power and ground circuit to the Adaptive Front Lighting System (AFS) Control Module
U3000-17	Control Module - Circuit voltage above threshold	● The power supply to the Module has been above 16 Volts for more than 1000 milliseconds	Suspect Charging fault. Check the battery condition and state of charge. Check the vehicle charging system. Refer to the relevant workshop manual section
B1D68-01	Left Headlamp Swiveling Feedback Sensor Circuit - General Electrical Failure	● Internal Headlamp Sensor Fault ● Internal Headlamp Circuit Fault	Using the manufacturer approved diagnostic system perform an On Demand Self Test, look for any errors in movement (compare with other headlamp) and visually inspect the lamp for internal damage or dislocation (ball joints out). If no faults are evident refer to the electrical circuit diagrams and check for circuit fault between the Headlamp Power Module and the swiveling feedback sensor. If no mechanical or circuit faults are evident, suspect headlamp internal fault, replace as required. Refer to the new module/component installation note at the top of the DTC Index
B1D69-01	Right Headlamp Swiveling Feedback Sensor Circuit - General Electrical Failure	● Internal Headlamp Sensor Fault ● Internal Headlamp Circuit Fault	Using the manufacturer approved diagnostic system perform an On Demand Self Test, look for any errors in movement (compare with other headlamp) and visually inspect the lamp for internal damage or dislocation (ball joints out). If no faults are evident refer to the electrical circuit diagrams and check for circuit fault between the Headlamp Power Module and the swiveling feedback sensor. If no mechanical or circuit faults are evident, suspect headlamp internal fault, replace as required. Refer to the new module/component installation note at the top of the DTC Index
B1D64-00	Left Headlamp Swiveling Motor Circuit - No Sub-Type Information	● Internal Headlamp Motor Fault ● Internal Headlamp Circuit Fault	Using the manufacturer approved diagnostic system perform an On Demand Self Test, look for any errors in movement (compare with other headlamp) and visually inspect the lamp for internal damage or dislocation (ball joints out). If no faults are evident refer to the electrical circuit diagrams and check for circuit fault between the Headlamp Power Module and the swiveling motor circuit. If no mechanical or circuit faults are evident, suspect headlamp internal fault, replace as required. Refer to the new module/component installation note at the top of the DTC Index
B1D65-00	Right Headlamp Swiveling Motor Circuit - No Sub-Type Information	● Internal Headlamp Motor Fault ● Internal Headlamp Circuit Fault	Using the manufacturer approved diagnostic system perform an On Demand Self Test, look for any errors in movement (compare with other headlamp) and visually inspect the lamp for internal damage or dislocation (ball joints out). If no faults are evident refer to the electrical circuit diagrams and check for circuit fault between the Headlamp Power Module and the swiveling motor circuit. If no mechanical or circuit faults are evident, suspect headlamp internal fault, replace as required. Refer to the new module/component installation note at the top of the DTC Index
B10A3-71	Left Swivel Actuator - Actuator Stuck	● Internal Headlamp Actuator Fault ● Internal Headlamp Circuit Fault	Using the manufacturer approved diagnostic system perform an On Demand Self Test, look for any errors in movement (compare with other headlamp) and visually inspect the lamp for internal damage or dislocation (ball joints out). If no faults are evident refer to the electrical circuit diagrams and check for circuit fault between the Headlamp Power Module and the swivel actuator. If no mechanical or circuit faults are evident, suspect headlamp internal fault, replace as required. Refer to the new module/component installation note at the top of the DTC Index
B10A4-71	Right Swivel Actuator - Actuator Stuck	● Internal Headlamp Actuator Fault ● Internal Headlamp Circuit Fault	Using the manufacturer approved diagnostic system perform an On Demand Self Test, look for any errors in movement (compare with other headlamp) and visually inspect the lamp for internal damage or dislocation (ball joints out). If no faults are evident

DTC	Description	Possible Causes	Action
			refer to the electrical circuit diagrams and check for circuit fault between the Headlamp Power Module and the swivel actuator. If no mechanical or circuit faults are evident, suspect headlamp internal fault, replace as required. Refer to the new module/component installation note at the top of the DTC Index
U0132-87	Lost Communication With Ride Level Control Module - Missing Message	● Missing message from the Air Suspension Control Module ● CAN Network fault	Check the Air Suspension Control Module for stored DTCs. Using the manufacturer approved diagnostic system, complete the CAN Network Integrity test. Refer to the electrical circuit diagrams and check the CAN Network between the Adaptive Front Lighting System (AFS) Control Module and the Air Suspension Control Module
U0126-87	Lost Communication With Steering Angle Sensor Module - Missing Message	● Missing message from the Steering Angle Sensor Module ● CAN Network fault	Check the Steering Angle Sensor Module for stored DTCs. Using the manufacturer approved diagnostic system, complete the CAN Network Integrity test. Refer to the electrical circuit diagrams and check the CAN Network between the Adaptive Front Lighting System (AFS) Control Module and the Steering Angle Sensor Module
U0126-86	Lost Communication With Steering Angle Sensor Module - Invalid Signal	● Invalid signal from the Steering Angle Sensor Module ● CAN Network fault	Check the Steering Angle Sensor Module for stored DTCs. Using the manufacturer approved diagnostic system, complete the CAN Network Integrity test. Refer to the electrical circuit diagrams and check the CAN Network between the Adaptive Front Lighting System (AFS) Control Module and the Steering Angle Sensor
U0155-87	Lost Communication With Instrument Panel Cluster (IPC) Control Module - Missing Message	● Missing message from the Instrument Cluster ● CAN Network fault	Check the Instrument Cluster for stored DTCs. Using the manufacturer approved diagnostic system, complete the CAN Network Integrity test. Refer to the electrical circuit diagrams and check the CAN Network between the Adaptive Front Lighting System (AFS) Control Module and the Instrument Cluster
U0102-87	Lost Communication with Transfer Case Control Module - Missing Message	● Missing message from the Transfer Box Control Module ● CAN Network fault	Check the Transfer Box Control Module for stored DTCs. Using the manufacturer approved diagnostic system, complete the CAN Network Integrity test. Refer to the electrical circuit diagrams and check the CAN Network between the Adaptive Front Lighting System (AFS) Control Module and the Transfer Box Control Module
U0122-87	Lost Communication With Vehicle Dynamics Control Module - Missing Message	● Missing message from the Dynamic Response Module ● CAN Network fault	Check the Dynamic Response Module for stored DTCs. Using the manufacturer approved diagnostic system, complete the CAN Network Integrity test. Refer to the electrical circuit diagrams and check the CAN Network between the Adaptive Front Lighting System (AFS) Control Module and the Dynamic Response Module
U0122-86	Lost Communication With Vehicle Dynamics Control Module - Invalid Signal	● Invalid signal from the Dynamic Response Module ● CAN Network fault	Check the Dynamic Response Module for stored DTCs. Using the manufacturer approved diagnostic system, complete the CAN Network Integrity test. Refer to the electrical circuit diagrams and check the CAN Network between the Adaptive Front Lighting System (AFS) Control Module and the Dynamic Response Module
U1A38-87	Lost communication to LH Power Light Module - Missing Message	● Headlamp Power Module internal fault ● Communication BUS circuit, short to power, ground or open circuit ● Power or Ground supply circuit fault	• NOTE: This circuit uses shielded cable • NOTE: The power module is a service item Refer to the electrical circuit diagrams, and check the power/ground supply and Communication circuit to the Headlamp Power Module. Using the manufacturer approved diagnostic system, clear stored DTCs in the Adaptive Front Lighting System (AFS) Control Module. Cycle the ignition state to off, then return to on and check for stored DTCs. If DTCs U1A38-87 and U1A39-87 return suspect Adaptive Front Lighting System (AFS) Control Module internal fault, If only DTC U1A38-87 returns suspect Headlamp Power Module internal fault. Replace as required. Refer to the new module/component installation note at the top of the DTC Index
U1A39-87	Lost communication to RH Power Light Module - Missing Message	● Headlamp Power Module internal fault ● Communication BUS circuit, short to power, ground or open circuit ● Power or Ground supply circuit fault	• NOTE: This circuit uses shielded cable • NOTE: The power module is a service item Refer to the electrical circuit diagrams, and check the power/ground supply and Communication circuit to the Headlamp Power Module. Using the manufacturer approved diagnostic system, clear stored DTCs in the Adaptive Front Lighting System (AFS) Control Module. Cycle the ignition state to off, then return to on and check for stored DTCs. If DTCs U1A38-87 and U1A39-87

DTC	Description	Possible Causes	Action
			return suspect Adaptive Front Lighting System (AFS) Control Module internal fault, If only DTC U1A39-87 returns suspect Headlamp Power Module internal fault. Replace as required. Refer to the new module/component installation note at the top of the DTC Index
U1A14-49	CAN Initialization Failure - Internal electronic failure	● Module internal failure ● CAN Network fault	Using the manufacturer approved diagnostic system, complete the CAN Network Integrity test. Check other modules for stored DTCs. Refer to the electrical circuit diagrams and check the CAN Network to the Adaptive Front Lighting System (AFS) Control Module for circuit fault. If no circuit faults are evident suspect Adaptive Front Lighting System (AFS) Control Module internal fault, replace as required. Refer to the new module/component installation note at the top of the DTC Index
U0300-62	Internal Control Module Software Incompatibility - Signal Compare Failure.	● The centrally broadcast module configuration data received is different to that which is stored	Check the correct Adaptive Front Lighting System (AFS) Control Module is installed to vehicle specification. Refit original or replace the module as required. Refer to the new module/component installation note at the top of the DTC Index
U3000-55	Control Module - Not Configured	● Incorrect Car Configuration File (CCF) data	• NOTE: The Car Configuration File (CCF) parameters required are (Vehicle type)(Headlamp type)(Gearbox type) and (Dayrunning light) Check the Instrument cluster for stored DTCs. Confirm the latest Strategy and Calibration software is installed in the Adaptive Front Lighting System (AFS) Control Module and the CJB, using the manufacturer approved diagnostic system update the Adaptive Front Lighting System (AFS) Control Module and CJB software as required
U3000-42	Control Module - General memory failure	● Module internal failure	Suspect Adaptive Front Lighting System (AFS) Control Module internal fault, replace as required. Refer to the new module/component installation note at the top of the DTC Index
U0073-00	Control Module Communication Bus Off - No Sub-Type Information	● Module internal failure ● CAN Network fault	Using the manufacturer approved diagnostic system, complete the CAN Network Integrity test. Check other modules for stored DTCs. Refer to the electrical circuit diagrams and check the CAN Network to Adaptive Front Lighting System (AFS) Control Module for circuit fault. If no circuit faults are evident suspect Adaptive Front Lighting System (AFS) Control Module internal fault, replace as required. Refer to the new module/component installation note at the top of the DTC Index
U0100-87	Lost Communication With ECM/PCM “A” - Missing Message	● Missing message from the Engine Control Module ● CAN Network fault	Check the Engine Control Module for stored DTCs. Using the manufacturer approved diagnostic system, complete the CAN Network Integrity test. Refer to the electrical circuit diagrams and check the CAN Network between the Adaptive Front Lighting System (AFS) Control Module and the Engine Control Module

Central Junction Box (CJB)

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

• NOTE: Prior to installation/replacement of the Headlamp Assembly carry out all relevant internal visual and mechanical checks for correct cable location and termination including: checks for corroded, bent or backed out pins, terminals and incorrectly inserted connectors.

DTC	Description	Possible causes	Action
B1D0011	Left Low Beam	● Left-hand low beam circuit short	Refer to the guided diagnostic routine for this code on

DTC	Description	Possible causes	Action
		circuit to ground	the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
B1D0015	Left Low Beam	● Left-hand low beam circuit short circuit to power ● Left-hand low beam circuit high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
B1D0111	Right Low Beam	● Right-hand low beam circuit short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
B1D0115	Right Low Beam	● Right-hand low beam circuit short circuit to power ● Right-hand low beam circuit high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
B1D0211	Left High Beam Circuit	● Left-hand high beam circuit short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
B1D0215	Left High Beam Circuit	● Left-hand high beam circuit short circuit to power ● Left-hand high beam circuit high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
B1D0311	Right High Beam Circuit	● Right-hand high beam circuit short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
B1D0315	Right High Beam Circuit	● Right-hand high beam circuit short circuit to power ● Right-hand high beam circuit high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
B1D3613	Turn Indicator Switch	● Left-hand steering column multifunction switch: high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
B1D4013	Lighting Switch Connection Circuit	● Lighting control switch circuit high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
U018287	Lost Communication With Lighting Control Module - Front	● CAN bus fault ● Adaptive Front Lighting System (AFS) Control Module disconnected ● Adaptive Front Lighting System (AFS) Control Module not configured/calibrated ● Adaptive Front Lighting System (AFS) Control Module failure	Refer to the Network Communications section of the workshop manual.
U300016	Control Module	● Circuit voltage below threshold	Check the battery condition and state of charge. Refer to section 414-00 - Charging System of the workshop manual. Check the control module circuits. Refer to the electrical guides.
U300017	Control Module	● Circuit voltage above threshold	Check the battery condition and state of charge. Refer to section 414-00 - Charging System of the workshop manual. Check the control module circuits. Refer to the electrical guides.
U300042	Control Module	● General memory failure	Refer to the warranty policy and procedures manual if a module is suspect.
U300055	Control Module	● Incorrect software loaded ● CAN wiring to Adaptive Front Lighting System (AFS) Control Module high resistance ● Incorrect Adaptive Front Lighting System (AFS) Control Module CAN configuration	Configure the modules using the approved diagnostic system. Check for CAN DTCs.

DTC	Description	Possible causes	Action
U1A1449	CAN Initialization Failure	● Internal electronic failure	Check the power and ground circuits to the component. Refer to the electrical guides. Configure the module(s) using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.

Exterior Lighting - Autolamps

Diagnosis and Testing

Overview

The automatic lighting system is only operational when **Auto** is selected on the lighting control switch

For information on the description and operation of the systems, refer to section 417-01 - Exterior Lighting of the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious electrical faults.

Visual Inspection Chart

Mechanical	Electrical
• Lighting control switch and installation • Rain/Light sensor condition and installation • Wiper control switch and installation	• Fuses - Battery junction box (BJB) - link 15E - BJB - link 16E - BJB - link 11E - BJB - link 25E - Central junction box (CJB) - Fuse 18P - CJB - Fuse 67P - CJB - Fuse 62P • Relays - Automatic headlamps relay • Wiring harness • Loose or corroded connector(s) • Battery junction box (BJB) • Central junction box (CJB) • Rain/Light sensor control module • Local interconnect network (LIN) circuits • Controller area network (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Because the DTCs are stored in more than one module, a complete vehicle read is recommended
    - Make sure that all DTCs are cleared following rectification

Symptom Chart

Symptom	Possible causes	Action
Side and headlamp(s) inoperative when the automatic headlamp switch option is selected	• Fuse(s) blown • Lighting control switch fault • Wiper control switch fault • Circuit fault • Rain/Light sensor fault • LIN circuit fault	Check the fuse(s) (see visual inspection). Check the lighting and wiper control switch functions. Check the automatic headlamp circuit. Refer to the electrical guides. Check for DTCs indicating a rain/light sensor or LIN system fault.
Automatic headlamp switch illumination inoperative	• Fuse(s) blown • Lighting control switch fault • Circuit fault • Automatic headlamp relay fault	Check the fuse(s) (see visual inspection). Check the lighting control switch function. Check the automatic headlamp relay circuit. Refer to the electrical guides. Check for DTCs indicating an automatic headlamp fault.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
B1A9801	LIN Bus Circuit #1	- LIN Bus short circuit to power or ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system. The LIN Bus is the serial link to the rain sensor, sunroof, memory seat modules which are optional install items, but the control of the DTC logging is determined from the car configuration file (CCF) (installed or not). Repair action only required if one or more items installed and not functioning correctly. Refer to the lost communication statement at the start of this table.
B1A9881	LIN Bus Circuit #1	- Software error - Rain/ambient light sensor lost power during transmission	Refer to the guided diagnostic routine for this code on the approved diagnostic system. No repair action necessary unless customer complains of rain sensor, roof opening panel or memory seat not functioning correctly. The LIN Bus is the serial link to the rain sensor, sunroof, memory seat modules which are optional install items, but the control of the DTC logging is determined from the car configuration file (CCF) (installed or not). Repair action only required if one or more items installed and not functioning correctly. Refer to the lost communication statement at the start of this table.
B1A9883	LIN Bus Circuit #1	- LIN Bus check sum error	Refer to the guided diagnostic routine for this code on the approved diagnostic system. The LIN Bus is the serial link to the rain sensor, sunroof, memory seat modules which are optional install items, but the control of the DTC logging is determined from the car configuration file (CCF) (installed or not). Repair action only required if one or more items installed and not functioning correctly. Refer to the lost communication statement at the start of this table.
B1B551C	Rain Sensor Module	- Rain sensor module supply voltage out of range	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the power supply to the sensor module from the CJB, repair as necessary. If the power supply exists, no further action necessary, clear/ignore DTC.
B1B5546	Rain Sensor Module	- Rain sensor module calibration/parameter memory failure: - Initialization error - unable to perform optical calibration	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the cleanliness of the windscreen in the sensor location. Check for correct installation of the sensor to the optical element and the adherence of the optical element to windscreen. Clear DTC and retest. If DTC persists, renew the rain/ambient light sensor.
B1B5549	Rain Sensor Module	- Internal electronic failure	Check the rain/light sensor module and circuit. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
B1B5587	Rain Sensor Module	- Missing message	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Rain sensor is not installed to all variants (optional). Fault logging is inhibited by the CCF, but an incorrectly configured CCF could give erroneous DTC logging. Repair action only required for vehicles with sunroof installed. Where necessary refer to the lost communication statement at the start of Communications Module section.
B1B5591	Rain Sensor Module	- Rain sensor module - measured temperature outside of normal operating range	No action necessary, clear/ignore DTC.
B1D3713	Wiper Switch Connection Circuit	- Wiper switch connection circuit open circuit	Refer to the electrical guides and check the switch circuit, repair/renew as necessary.
B1C8612	Autolights Switch Illumination Relay Output	- Autolamps switch illumination relay output circuit short to power	Where installed, refer to the electrical guides and check the autolamps switch illumination relay circuit, repair/renew as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C8614	Autolights Switch Illumination Relay Output	- Autolamps switch illumination relay output circuit short to ground or open circuit	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Where installed, refer to the electrical guides and check the autolamps switch illumination relay supply fuse and the relay output circuit, repair as necessary. Where the feature is not

DTC	Description	Possible causes	Action
			installed, check the vehicle configuration and clear/ignore this DTC.
B1D4013	Lighting Switch Connection Circuit	● Lighting switch connection circuit open circuit	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the switch circuit, repair/renew as necessary.
U1A1449	CAN Initialisation Failure	● Internal electronic failure	Check the power and ground circuits to the component. Refer to the electrical guides. Configure the module(s) using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.

Exterior Lighting - Stoplamps

Diagnosis and Testing

Overview

For information on the description and operation of the system, refer to section 417-01 - Exterior Lighting of the workshop manual. Note that the stoplamps will be activated automatically under certain conditions when the ride and handling optimization function is used, refer to section 204-06 - Ride and Handling Optimization of the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious electrical faults.

Visual Inspection Chart

Mechanical	Electrical
● Stoplamp condition and installation ● Bulbs and installation ● Bulb holders and installation ● Stoplamp switch condition and installation	● Fuses - Battery junction box (BJB) - link 16E - BJB - link 11E - Central junction box (CJB) - Fuse 15P - CJB - fuse 66P ● Wiring harness ● Loose or corroded connector(s) ● Hill descent relay ● Battery junction box (BJB) ● Central junction box (CJB) ● ABS control module ● Controller area network (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Because the DTCs are stored in more than one module, a complete vehicle read is recommended.
    - Make sure that all DTCs are cleared following rectification

Symptom Chart

Symptom	Possible causes	Action
Stoplamp(s) inoperative	● Bulb failure ● LED lamp failure ● Fuse(s) blown ● Circuit fault ● Stoplamp switch fault	Check the bulb, LED lamp and fuse condition (see visual inspection). Check the stoplamp circuits. Check the stoplamp switch function. Refer to the electrical guides. Check for DTCs indicating a stoplamp circuit fault.
Stoplamp(s) dim	● Incorrect bulb rating ● Circuit fault	Check the bulb condition and rating. Check the stoplamp circuits. Refer to the electrical guides.
Stoplamp(s) stuck on	● Stoplamp switch fault ● Circuit fault ● Hill descent relay circuit fault	Check the stoplamp switch function. Check the stoplamp circuits. Refer to the electrical guides. Check for DTCs indicating a stoplamp circuit fault

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action

DTC	Description	Possible causes	Action
C110501	Brake Lamp Control	● General electrical failure ● Stoplamp control short circuit to power ● Stoplamp control short circuit to ground	Check the stoplamp control circuits. Refer to the electrical guides.
C110567	Brake Lamp Control	● Signal incorrect after event	Check the stoplamp circuits. Refer to the electrical guides.
C1A9613	Brake Light Switch	● Stoplamp switch circuit short circuit to power	Check the stoplamp switch and circuits. Refer to the electrical guides.
C1A9624	Brake Light Switch	● Stoplamp switch circuit signal stuck high	Check the stoplamp switch and circuits. Refer to the electrical guides.
C1A9662	Brake Light Switch	● signal compare failure	Check the stoplamp switch and circuits. Refer to the electrical guides.
C1A9664	Brake Light Switch	● Signal plausibility failure	Check the stoplamp switch and circuits. Refer to the electrical guides.
U1A1449	CAN Initialisation Failure	● Internal electronic failure	Check the power and ground circuits to the component. Refer to the electrical guides. Configure the module(s) using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.

Exterior Lighting - Turn Signal, Cornering and Hazard Lamps

Diagnosis and Testing

Overview

For information on the description and operation of the systems, refer to section 417-01 - Exterior Lighting of the workshop manual.

When diagnosing cornering/static bending lamp faults note that the operating principle differs slightly when the headlamp system is installed with the adaptive front lighting system (AFS).

Inspection and Verification

1. **1.** Verify the customer concern.
    - Note that intermittent fault reports may be due to the cycling operation of the field effect transistors (FETs)
2. **2.** Visually inspect for obvious electrical faults.

Visual Inspection Chart

Mechanical	Electrical
• Turn signal lamp(s) condition and installation • Cornering lamp(s) condition and installation • Bulbs and installation • Bulb holders and installation • Lighting control switch and installation • Left-hand steering column multifunction switch and installation • hazard lamp switch condition and installation	• Fuses - Battery junction box (BJB) - link 16E - BJB - link 11E - Central junction box (CJB) - Fuse 61P • Wiring harness • Loose or corroded connector(s) • Battery junction box (BJB) • Central junction box (CJB) • Steering angle sensor • ABS control module • Instrument panel cluster (IPC) • Adaptive front lighting system (AFS) module • Restraints control module • Controller area network (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Because the DTCs are stored in more than one module, a complete vehicle read is recommended
    - Make sure that all DTCs are cleared following rectification

Symptom Chart

Symptom	Possible causes	Action
Turn signal/hazard lamp(s) inoperative	• Bulb failure • Fuse(s) blown • Circuit fault • Left-hand steering column multifunction switch fault • Hazard lamp switch fault	Check the bulb and fuse condition (see visual inspection). Check the turn signal/hazard lamp circuits. Check the left-hand steering column multifunction switch function. Check the hazard lamp switch function. Refer to the electrical guides. Check for DTCs indicating a turn signal/hazard lamp circuit fault.
Turn signal/hazard lamp(s) dim	• Incorrect bulb rating • Circuit fault • Left-hand steering column multifunction switch fault • Hazard lamp switch fault	Check the bulb condition and rating. Check the turn signal/hazard lamp circuits. Check the left-hand steering column multifunction switch function. Check the hazard lamp switch function. Refer to the electrical guides.

Symptom	Possible causes	Action
Turn signal/hazard lamp(s) stuck on	- Left-hand steering column multifunction switch fault - Hazard lamp switch fault - Circuit fault	Check the turn signal/hazard lamp circuits. Check the left-hand steering column multifunction switch function. Check the hazard lamp switch function. Refer to the electrical guides. Check for DTCs indicating a turn signal/hazard lamp circuit fault
Warning lamp(s) inoperative	- Fuse(s) blown - Left-hand steering column multifunction switch inoperative - Hazard lamp switch inoperative - Circuit fault - Instrument cluster fault	Check the fuse(s) (see visual inspection). Check the left-hand steering column multifunction switch function. Check the hazard lamp switch function. Check the warning lamp circuits. Refer to the electrical guides. Check for DTCs indicating an instrument cluster or CAN system fault.
Cornering lamp(s) inoperative	- Bulb failure - Fuse(s) blown - Circuit fault - Left-hand steering column multifunction switch fault - Lighting control switch fault	Check the bulb and fuse condition (see visual inspection). Check cornering lamp circuits. Check the lighting control switch function. Check the left-hand steering column multifunction switch function. Refer to the electrical guides. Check for DTCs indicating a cornering lamp circuit fault.
Cornering lamp(s) dim	- Incorrect bulb rating - Circuit fault - Left-hand steering column multifunction switch fault - Lighting control switch fault	Check the bulb condition and rating. Check the cornering lamp circuits. Check the left-hand steering column multifunction switch function. Check the lighting control switch function. Refer to the electrical guides.
Cornering lamp(s) stuck on	- Left-hand steering column multifunction switch fault - Lighting control switch fault - Circuit fault	Check the cornering lamp circuits. Check the left-hand steering column multifunction switch function. Check the lighting control switch function. Refer to the electrical guides. Check for DTCs indicating a cornering lamp circuit fault

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
B1C9811	Left Corner Lamp Circuit	- Left-hand corner lamp short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
B1C9815	Left Corner Lamp Circuit	- Left-hand corner lamp short circuit to power - Left-hand corner lamp high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
B1C9911	Right Corner Lamp Circuit	- Right-hand corner lamp short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
B1C9915	Right Corner Lamp Circuit	- Right-hand corner lamp short circuit to power - Right-hand corner lamp high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
B1D0611	Left Turn Indicator	- Left turn signal short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.

DTC	Description	Possible causes	Action
B1D0615	Left Turn Indicator	● Left turn signal short circuit to power ● Left turn signal: high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
B1D0711	Right Turn Indicator	● Right turn signal short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
B1D0715	Right Turn Indicator	● Right turn signal: short circuit to power ● Right turn signal: high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
B1D3523	Hazard Switch	● Hazard lamp switch circuit signal stuck low	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
B1D3613	Turn Indicator Switch	● Left-hand steering column multifunction switch high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
B1D4013	Lighting Switch Connection Circuit	● Lighting control switch connection switch high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair/renew as necessary.
U1A1449	CAN Initialisation Failure	● Internal electronic failure	Check the power and ground circuits to the component. Refer to the electrical guides. Configure the module(s) using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.

Exterior Lighting - Parking, Rear and License Plate Lamps

Diagnosis and Testing

Overview

For information on the description and operation of the systems, refer to section 417-01 - Exterior Lighting of the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious electrical faults.

Visual Inspection Chart

Mechanical	Electrical
● Rear lamp(s) condition and installation ● License lamp(s) condition and installation ● Bulbs and installation ● Bulb holders and installation ● Lighting control switch and installation ● Rain/Light sensor condition and installation	● Fuses - Battery junction box (BJB) - link 15E - BJB - link 16E - BJB - link 11E - BJB - link 25E - Central junction box (CJB) - Fuse 2P - CJB - Fuse 4P - CJB - Fuse 18P - CJB - Fuse 67P - CJB - Fuse 62P ● Relays - Rear/License lamp relay - Automatic headlamps relay ● Wiring harness ● Loose or corroded connector(s) ● Battery junction box (BJB) ● Central junction box (CJB) ● Rain/Light sensor control module ● Local interconnect network (LIN) circuits ● Controller area network (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Because the DTCs are stored in more than one module, a complete vehicle read is recommended
    - Make sure that all DTCs are cleared following rectification

Symptom Chart

Symptom	Possible causes	Action
Rear/License lamp(s) inoperative	● Bulb failure ● Fuse(s) blown ● Circuit fault ● Lighting control switch fault	Check the bulb and fuse condition (see visual inspection). Check the rear/license lamp circuits. Check the lighting control switch function. Refer to the electrical guides. Check for DTCs indicating a rear/license lamp circuit fault.
Rear/License lamp(s) dim	● Incorrect bulb rating ● Circuit fault ● Lighting control switch fault	Check the bulb condition and rating. Check the rear/license lamp circuits. Check the lighting control switch function. Refer to the electrical guides.
Rear/License lamp(s) stuck on	● Circuit fault ● Lighting control switch	Check the rear/license lamp circuits. Check the lighting control switch function. Refer to the electrical guides. Check for DTCs indicating a rear/license lamp circuit fault

Symptom	Possible causes	Action
	fault	
Rear/License lamp(s) inoperative when the automatic headlamp switch option is selected	- Fuse(s) blown - Lighting control switch fault - Circuit fault - Rain/Light sensor fault - LIN circuit fault	Check the fuse(s) (see visual inspection). Check the lighting control switch function. Check the automatic headlamp circuit. Refer to the electrical guides. Check for DTCs indicating a rain/light sensor or LIN system fault.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
B1A9801	LIN Bus Circuit #1	- LIN Bus short circuit to power or ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system. The LIN Bus is the serial link to the rain sensor, sunroof, memory seat modules which are optional install items, but the control of the DTC logging is determined from the car configuration file (CCF) (installed or not). Repair action only required if one or more items installed and not functioning correctly. Refer to the lost communication statement at the start of this table.
B1A9881	LIN Bus Circuit #1	- Software error - Rain/ambient light sensor lost power during transmission	Refer to the guided diagnostic routine for this code on the approved diagnostic system. No repair action necessary unless customer complains of rain sensor, roof opening panel or memory seat not functioning correctly. The LIN Bus is the serial link to the rain sensor, sunroof, memory seat modules which are optional install items, but the control of the DTC logging is determined from the car configuration file (CCF) (installed or not). Repair action only required if one or more items installed and not functioning correctly. Refer to the lost communication statement at the start of this table.
B1A9883	LIN Bus Circuit #1	- LIN Bus check sum error	Refer to the guided diagnostic routine for this code on the approved diagnostic system. The LIN Bus is the serial link to the rain sensor, sunroof, memory seat modules which are optional install items, but the control of the DTC logging is determined from the car configuration file (CCF) (installed or not). Repair action only required if one or more items installed and not functioning correctly. Refer to the lost communication statement at the start of this table.
B1B551C	Rain Sensor Module	- Rain sensor module supply voltage out of range	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the power supply to the sensor module from the CJB, repair as necessary. If the power supply exists, no further action necessary, clear/ignore DTC.
B1B5546	Rain Sensor Module	- Rain sensor module calibration/parameter memory failure: - Initialization error - unable to perform optical calibration	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the cleanliness of the windscreen in the sensor location. Check for correct installation of the sensor to the optical element and the adherence of the optical element to windscreen. Clear DTC and retest. If DTC persists, renew the rain/ambient light sensor.
B1B5549	Rain Sensor Module	- Internal electronic failure	Check the rain/light sensor module and circuit. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
B1B5587	Rain Sensor Module	- Missing message	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Rain sensor is not installed to all variants (optional). Fault logging is inhibited by the CCF, but an incorrectly configured CCF could give erroneous DTC logging. Repair action only required for vehicles with sunroof installed. Where necessary refer to the lost communication statement at the start of Communications Module section.

DTC	Description	Possible causes	Action
B1B5591	Rain Sensor Module	- Rain sensor module - measured temperature outside of normal operating range	No action necessary, clear/ignore DTC.
B1C6012	Sidelights Relay Output Circuit	- Side lamps relay output circuit short to power - Rear tail/brake lamp bulb incorrect spec - Rear tail/brake lamp bulb fault	A bulb fault can also cause DTC B1B0187 to be logged in the Network Communications Module and DTC C1A5564 to be logged in the Park Brake Module. A fault in this circuit causing DTC B1C6012 to log could also cause up shift issues on automatic transmission vehicles. Check the rear tail/brake lamp bulbs for correct type, installation or faults including a short circuit of the bulb filaments. Refer to the electrical guides and check side lamps relay output circuit, repair/renew as necessary.
B1C6014	Sidelights Relay Output Circuit	- Rear/License lamp relay output circuit short circuit to ground - Rear/License lamp relay output circuit high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1D4013	Lighting Switch Connection Circuit	- Lighting switch connection circuit open circuit	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the switch circuit, repair/renew as necessary.
U1A1449	CAN Initialisation Failure	- Internal electronic failure	Check the power and ground circuits to the component. Refer to the electrical guides. Configure the module(s) using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.

Exterior Lighting - Front Fog Lamps

Diagnosis and Testing

Overview

For information on the description and operation of the system, refer to section 417-01 - Exterior Lighting of the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious electrical faults.

Visual Inspection Chart

Mechanical	Electrical
● Front fog lamp condition and installation ● Bulb and installation ● Bulb holder and installation ● Adjuster screw ● Fog lamp switch condition and installation	● Fuses - Battery junction box (BJB) - link 2E - BJB - link 11E - Central junction box (CJB) - Fuse 28P - CJB - Fuse 38P ● Wiring harness ● Loose or corroded connector(s) ● Fog lamp relay ● Fog lamp warning indicator ● Fog lamp switch ● Battery junction box (BJB) ● Central junction box (CJB)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
   - Because the DTCs are stored in more than one module, a complete vehicle read is recommended.
   - Make sure that all DTCs are cleared following rectification

Symptom Chart

Symptom	Possible causes	Action
Fog lamp inoperative	● Bulb failure ● Fuse(s) blown ● Circuit fault ● Switch inoperative	Check the bulb condition. Check the fuse(s) (see visual inspection). Check the fog lamp circuits. Check the switch function. Refer to the electrical guides.
Fog lamp dim	● Incorrect bulb rating ● Circuit fault ● Switch fault	Check the bulb condition and rating. Check the fog lamp circuits. Check the switch function. Refer to the electrical guides.
Fog lamp lighting coverage poor	● Fog lamp alignment incorrect	Check and adjust fog lamp alignment.
Warning lamp inoperative	● Fuse(s) blown ● Switch inoperative ● Circuit fault ● Instrument panel cluster fault	Check the fuse(s) (see visual inspection). Check the switch function. Check the warning lamp circuits. Refer to the electrical guides. Check for DTCs indicating an instrument cluster fault.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
B1A7864	Front Fog Lamp	- signal plausibility fault	Check the instrument panel cluster module and circuits. Refer to the electrical guides.
B1D4013	Lighting Switch Connection Circuit	- Lighting switch connection circuit open circuit	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the switch circuit, repair/renew as necessary.

    - Make sure that all DTCs are cleared following rectification

Symptom Chart

Symptom	Possible causes	Action
Fog lamp inoperative	● Bulb failure ● Fuse(s) blown ● Circuit fault ● Switch inoperative	Check the bulb condition. Check the fuse(s) (see visual inspection). Check the fog lamp circuits. Check the switch function. Refer to the electrical guides.
Fog lamp dim	● Incorrect bulb rating ● Circuit fault ● Switch fault	Check the bulb condition and rating. Check the fog lamp circuits. Check the switch function. Refer to the electrical guides.
Warning lamp inoperative	● Fuse(s) blown ● Switch inoperative ● Circuit fault ● Instrument cluster fault	Check the fuse(s) (see visual inspection). Check the switch function. Check the warning lamp circuits. Refer to the electrical guides. Check for DTCs indicating an instrument cluster fault.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action

DTC	Description	Possible causes	Action
B1A7964	Rear Fog Lamp	- signal plausibility fault	Check the instrument cluster and circuits. Refer to the electrical guides.
B1D4013	Lighting Switch Connection Circuit	- Lighting switch connection circuit open circuit	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the switch circuit, repair/renew as necessary.

Published: 11-May-2011

Exterior Lighting - Reversing Lamps

Diagnosis and Testing

Overview

For information on the description and operation of the system, refer to section 417-01 - Exterior Lighting of the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious electrical faults.

Visual Inspection Chart

Mechanical	Electrical
• Reversing lamp condition and installation • Bulb and installation • Bulb holder and installation	• Fuses - Battery junction box (BJB) - link 16E - BJB - link 11E - Central junction box (CJB) - Fuse 5P • Wiring harness • Loose or corroded connector(s) • Reversing lamp relay • Battery junction box (BJB) • Central junction box (CJB) • Transmission control module (TCM) • Controller area network (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Because the DTCs are stored in more than one module, a complete vehicle read is recommended.
    - Make sure that all DTCs are cleared following rectification

Symptom Chart

Symptom	Possible causes	Action
Reversing lamp(s) inoperative	• Bulb failure • Fuse(s) blown • Circuit fault • Missing reversing switch signal	Check the bulb and fuse condition (see visual inspection). Check the reversing lamp circuits. Refer to the electrical guides. Check for DTCs indicating a reversing lamp circuit fault.
Reversing lamp(s) dim	• Incorrect bulb rating • Circuit fault	Check the bulb condition and rating. Check the reversing lamp circuits. Refer to the electrical guides.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
B1C8812	Reversing Lamps Relay Coil Circuit	• Reversing lamps relay coil circuit short circuit to power	Check the reversing lamp relay coil and circuits. Refer to the electrical guides.
B1C8814	Reversing Lamps Relay Coil Circuit	• Reversing lamps relay coil circuit high resistance • Reversing lamps relay coil circuit: short circuit	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
		to ground	
B1C8912	Reversing Lamps Relay Output Circuit	● Reversing lamps relay output circuit short circuit to power	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1C8914	Reversing Lamps Relay Output Circuit	● Reversing lamps relay output coil circuit high resistance ● Reversing lamps relay output coil circuit short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
U1A1449	CAN Initialization Failure	● Internal electronic failure	Check the power and ground circuits to the component. Refer to the electrical guides. Configure the module(s) using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.

Exterior Lighting - Trailer Lamps

Diagnosis and Testing

Overview

For information on the description and operation of the system, refer to section 417-01 - Exterior Lighting of the workshop manual.

Prior to carrying out fault diagnosis of the trailer lamp system, verify the operation of the towing vehicle lighting system with the trailer lighting plug(s) disconnected from the vehicle socket(s).

Note that intermittent fault reports may be due to the cycling operation of the field effect transistors (FETs).

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious electrical faults.

Visual Inspection Chart

Mechanical	Electrical
● Trailer lamp(s) condition and installation ● Bulbs and installation ● Bulb holders and installation ● Trailer socket(s), plug(s) and installation	● Fuses - Battery junction box (BJB) - link 18E - BJB - link 11E - Central junction box (CJB) - Fuse 22P - (CJB) - Fuse 8P - (CJB) - Fuse 6P - (CJB) - Fuse 32P - (CJB) - Fuse 14P - Trailer fuse box - Fuse to trailer socket relay - Trailer fuse box - Fuse to trailer socket battery feed - Trailer fuse box - Fuse to trailer socket brake lamp - Trailer fuse box - Fuse to trailer socket fog lamps - Trailer fuse box - Fuse to trailer socket right hand tail lamp - Trailer fuse box - Fuse to trailer socket number plate and left hand tail lamps ● Relays - Reverse lamp relay - Side lamp relay - trailer socket relay ● Stop lamp switch ● Wiring harness ● Loose or corroded connector(s) ● Trailer socket(s) ground circuit(s) ● Battery junction box (BJB) ● Central junction box (CJB) ● Trailer fuse box ● Trailer relay box ● Instrument panel cluster (IPC) ● Controller area network (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Because the DTCs are stored in more than one module, a complete vehicle read is recommended.
    - Make sure that all DTCs are cleared following rectification

Symptom Chart

Symptom	Possible causes	Action
Trailer brake lamp(s) inoperative	● Bulb failure ● Fuse(s) blown ● Circuit fault	Check the bulb and fuse condition (see visual inspection). Check the trailer brake lamp circuit. Check the brake lamp switch function. Refer to the electrical guides.

Symptom	Possible causes	Action
	● Brake lamp switch fault	
Trailer brake lamp(s) dim	● Incorrect bulb rating ● Circuit fault ● Brake lamp switch fault	Check the bulb condition and rating. Check the trailer brake lamp circuit. Check the brake lamp switch function. Refer to the electrical guides.
Trailer brake lamp(s) stuck on	● Circuit fault ● Brake lamp switch fault	Check the trailer brake lamp circuits. Check the brake lamp switch function. Refer to the electrical guides.
Trailer fog lamp(s) inoperative	● Bulb failure ● Fuse(s) blown ● Circuit fault	Check the bulb and fuse condition (see visual inspection). Check the trailer fog lamp circuit. Refer to the electrical guides.
Trailer fog lamp(s) dim	● Incorrect bulb rating ● Circuit fault	Check the bulb condition and rating. Check the trailer fog lamp circuit. Refer to the electrical guides.
Trailer fog lamp(s) stuck on	● Circuit fault	Check the trailer fog lamp circuit. Refer to the electrical guides.
Trailer tail and number plate lamp(s) inoperative	● Bulb failure ● Fuse(s) blown ● Circuit fault ● Trailer side lamp relay fault	Check the bulb and fuse condition (see visual inspection). Check the trailer tail and number plate lamp circuit. Check the trailer tail and number plate lamp relay function. Refer to the electrical guides.
Trailer tail and number plate lamp(s) dim	● Incorrect bulb rating ● Circuit fault ● Trailer side lamp relay fault	Check the bulb condition and rating. Check the trailer tail and number plate lamp circuit. Check the trailer side lamp relay function. Refer to the electrical guides.
Trailer tail and number plate lamp(s) stuck on	● Circuit fault ● Trailer tail and number plate lamp relay fault	Check the trailer tail and number plate lamp circuit. Check the trailer tail and number plate lamp relay function. Refer to the electrical guides.
Trailer turn signal lamp(s) inoperative	● Bulb failure ● Fuse(s) blown ● Circuit fault	Check the bulb and fuse condition (see visual inspection). Check the trailer turn signal lamp circuit. Refer to the electrical guides.
Trailer turn signal lamp(s) dim	● Incorrect bulb rating ● Circuit fault	Check the bulb condition and rating. Check the trailer turn signal lamp circuits. Refer to the electrical guides.
Trailer turn signal lamp(s) stuck on	● Circuit fault	Check the bulb and fuse condition (see visual inspection). Check the trailer turn signal lamp circuit. Refer to the electrical guides.
Trailer reverse lamp(s) inoperative	● Bulb failure ● Fuse(s) blown ● Circuit fault ● Trailer reverse lamp relay fault	Check the bulb and fuse condition (see visual inspection). Check the trailer reverse lamp circuit. Check the trailer reverse lamp relay function. Refer to the electrical guides.
Trailer reverse lamp(s) dim	● Circuit fault ● Trailer reverse lamp relay fault	Check the bulb condition and rating. Check the trailer reverse lamp circuit. Check the trailer reverse lamp relay function. Refer to the electrical guides.
Trailer reverse lamp(s) stuck on	● Circuit fault ● Trailer reverse lamp relay fault	Check the trailer reverse lamp circuit. Check the trailer reverse lamp relay function. Refer to the electrical guides.
Warning lamp(s) inoperative	● Fuse(s) blown ● Circuit fault ● Instrument cluster fault	Check the fuse(s) (see visual inspection). Check the warning lamp circuit. Refer to the electrical guides. Check for DTCs indicating an instrument cluster or CAN system fault.
Trailer socket battery feed missing	● Fuse(s) blown ● Circuit fault	Check the fuse condition (see visual inspection). Check the trailer battery feed circuit. Refer to the electrical guides.

Symptom	Possible causes	Action
Trailer socket ignition feed missing	- Fuse(s) blown - Circuit fault - Trailer socket relay faulty	Check the fuse condition (see visual inspection). Check the trailer ignition feed circuit. Check the trailer ignition feed relay operation. Refer to the electrical guides.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
B1D0811	Lefthand Trailer Direction Indicator Circuit	- Left trailer turn signal short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1D0815	Lefthand Trailer Direction Indicator Circuit	- Left trailer turn signal short circuit to power - Left trailer turn signal: high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1D0911	Righthand Trailer Direction Indicator Circuit	- Right trailer turn signal short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1D0915	Righthand Trailer Direction Indicator Circuit	- Right trailer turn signal short circuit to power - Right trailer turn signal high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
U1A1449	CAN Initialization Failure	- Internal electronic failure	Check the power and ground circuits to the component. Refer to the electrical guides. Configure the module(s) using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.

Exterior Lighting - Headlamp Leveling

Diagnosis and Testing

Overview

Two systems of headlamp leveling are available: static and dynamic. Prior to diagnosis, identify the headlamp leveling system installed to the vehicle. Dynamic headlamp leveling is only available on vehicles with an adaptive front lighting system (AFS).

For information on the description and operation of the systems, refer to section 417-01 - Exterior Lighting of the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious electrical faults.

Visual Inspection Chart

Mechanical	Electrical
● Headlamp leveling motor(s) and linkage(s) condition and installation ● Lighting control switch and installation ● Left-hand steering column multifunction switch and installation	● Fuses - Battery junction box (BJB) - link 11E - Central junction box (CJB) - Fuse 61P - CJB - Fuse 56P - CJB - Fuse 27P - CJB - Fuse 62P ● Wiring harness ● Loose or corroded connector(s) ● Battery junction box (BJB) ● Central junction box (CJB) ● Adaptive front lighting system (AFS) module ● Headlamp power modules ● Engine control module (ECM) ● Anti-lock brake system (ABS) control module ● Air suspension control module ● Local interconnect network (LIN) circuits ● Controller area network (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - ○ Because the DTCs are stored in more than one module, a complete vehicle read is recommended
    - ○ Make sure that all DTCs are cleared following rectification

Symptom Chart

Symptom	Possible causes	Action
Headlamp leveling system inoperative	● Fuse(s) blown ● Leveling motor/linkage fault ● Headlamp leveling circuit fault ● Air suspension system fault	Check the fuse(s) condition (see visual inspection). Check the headlamp leveling motor and linkage condition. Check the headlamp leveling circuit. Refer to the electrical guides. Check for DTCs indicating headlamp leveling circuit and air suspension system fault(s).
Headlamp alignment incorrect		

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
B1D3613	Turn Indicator Switch	● Left-hand steering column	Refer to the guided diagnostic routine for this code on the

DTC	Description	Possible causes	Action
		multifunction switch high resistance	approved diagnostic system. Refer to the electrical guides and check the switch circuit, repair/renew as necessary.
B1D4013	Lighting Switch Connection Circuit	● Lighting control switch circuit: high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the switch circuit, repair/renew as necessary.
U018287	Lost Communication With Lighting Control Module - Front	● CAN bus fault ● AFS module disconnected ● AFS module not configured/calibrated ● AFS module failure	Refer to the Network Communications section of the workshop manual.
U300016	Control Module	● Circuit voltage below threshold	Check the battery condition and state of charge. Refer to section 414-00 - Charging System of the workshop manual. Check the control module circuits. Refer to the electrical guides.
U300017	Control Module	● Circuit voltage above threshold	Check the battery condition and state of charge. Refer to section 414-00 - Charging System of the workshop manual. Check the control module circuits. Refer to the electrical guides.
U300042	Control Module	● General memory failure	Refer to the warranty policy and procedures manual if a module is suspect.
U300055	Control Module	● Incorrect software loaded ● CAN wiring to AFS module high resistance ● Incorrect AFS module CAN configuration	Configure the modules using the approved diagnostic system. Check for CAN DTCs.
U1A1449	CAN Initialization Failure	● Internal electronic failure	Check the power and ground circuits to the component. Refer to the electrical guides. Configure the module(s) using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.

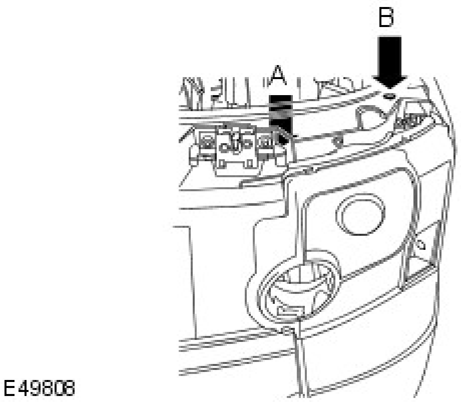
Exterior Lighting - Headlamp Adjustment

General Procedures

- NOTE: With self leveling suspension, make sure the vehicle is at the standard ride height.
- NOTE: The headlamp setting is 1.2 % below horizontal and parallel.
- NOTE: NAS vehicles have vertical adjustment only.



1. Align the headlamp beam setting equipment to one headlamp.

2. Switch the headlamps on and to dipped beam.

3. NOTE: NAS vehicles have vertical adjustment only.

Adjust the headlamps with a Philips screwdriver.

- Rotate the adjusters A and B by an equal amount for vertical alignment.
- Rotate the adjusters A or B for horizontal alignment.

4. To adjust the second headlamp, repeat the above procedure.

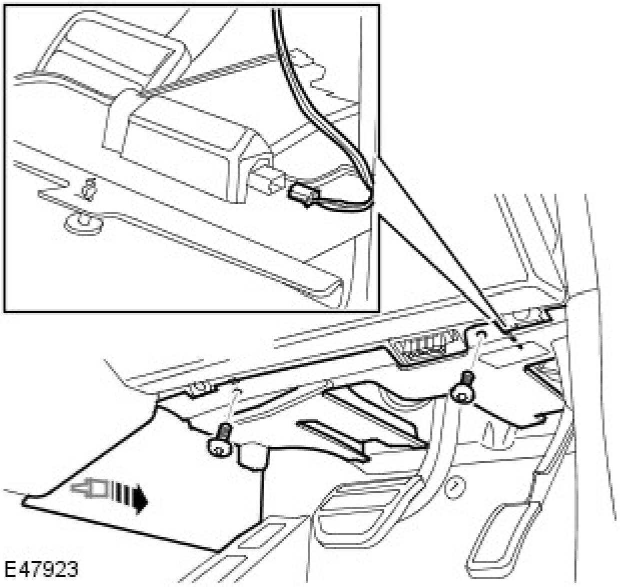
Exterior Lighting - Stoplamp Switch

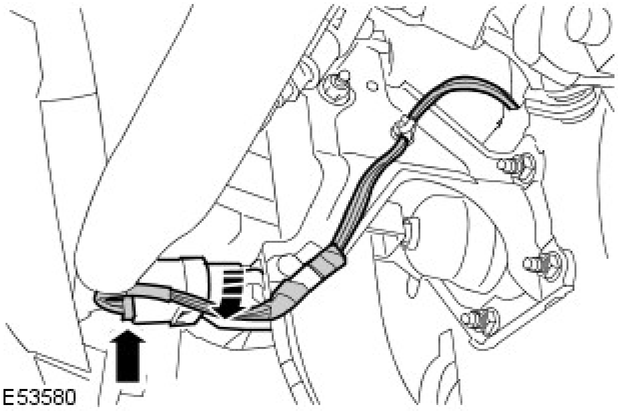
Removal and Installation

Removal



1. Remove the closing trim panel.

- Release the clip.
- Remove the 2 screws.
- Disconnect the electrical connector.



2. ⚠ CAUTION: The brake pedal MUST NOT be depressed during this operation. Failure to comply will result in damage to the stoplamp switch.

Remove the stoplamp switch.

- Disconnect the electrical connector.
- Rotate the switch clockwise.

Installation

1. CAUTIONS:

⚠ The brake pedal MUST NOT be depressed during this operation. Failure to comply will result in damage to the stoplamp switch.

⚠ Make sure that excessive force is not used when installing the stoplamp switch. Failure to follow this instruction may result in damage to the stoplamp switch.

Install the stoplamp switch.

- Rotate the switch counterclockwise.
- Connect the electrical connector.

2. Install the closing trim panel.

- Connect the electrical connector.
- Secure the clip.
- Tighten the screws.

Exterior Lighting - Headlamp Assembly

Removal and Installation

Removal

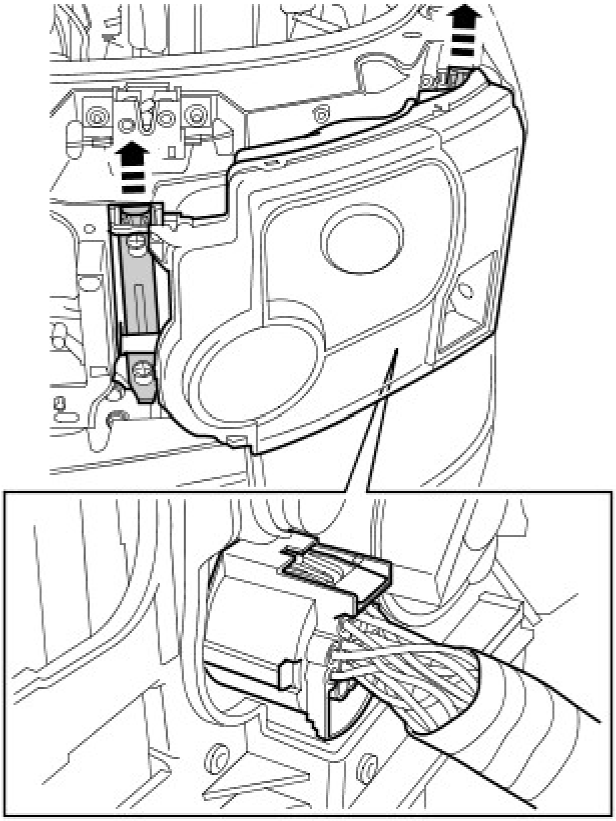
WARNING: Vehicles fitted with Xenon headlamps, the following precautions must be observed. Failure to comply may result in exposure to ultra violet rays, severe electric shock, burns or the risk of explosion. Ensure the headlamps are switched off at all times. Eye and hand protection must be worn. Never switch on the lamps or test the bulbs with the lamp holder released from the headlamp.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the front radiator grille.
For additional information, refer to: Radiator Grille (501-08 Exterior Trim and Ornamentation, Removal and Installation).

3. WARNING: Vehicles fitted with Xenon headlamps, the following precautions must be observed. Failure to comply may result in exposure to ultra violet rays, severe electric shock, burns or the risk of explosion. Ensure the headlamps are switched off at all times. Eye and hand protection must be worn. Never switch on the lamps or test the bulbs with the lamp holder released from the headlamp.

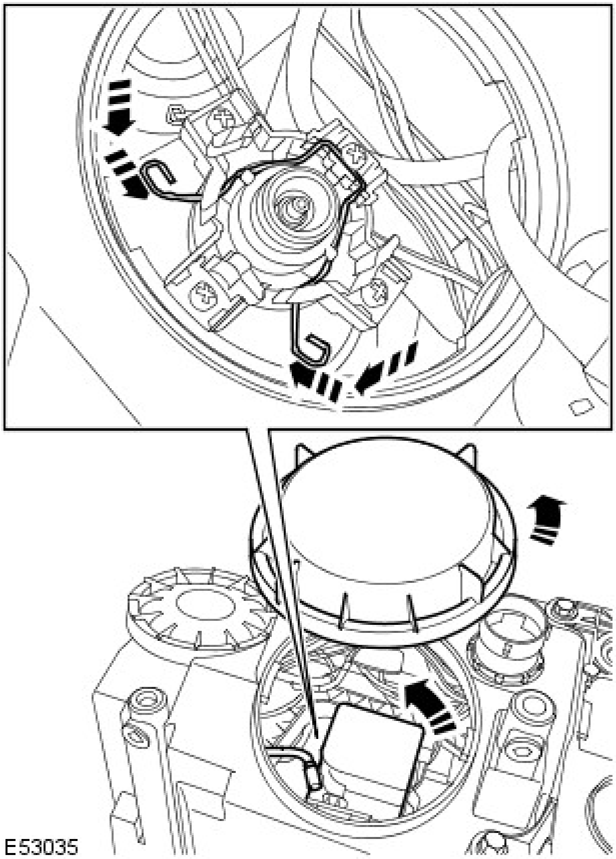
CAUTION: Always protect paintwork and glass when removing exterior components.



E49565

Remove the headlamp assembly.

- Release the headlamp assembly clips.
- Disconnect the electrical connector.



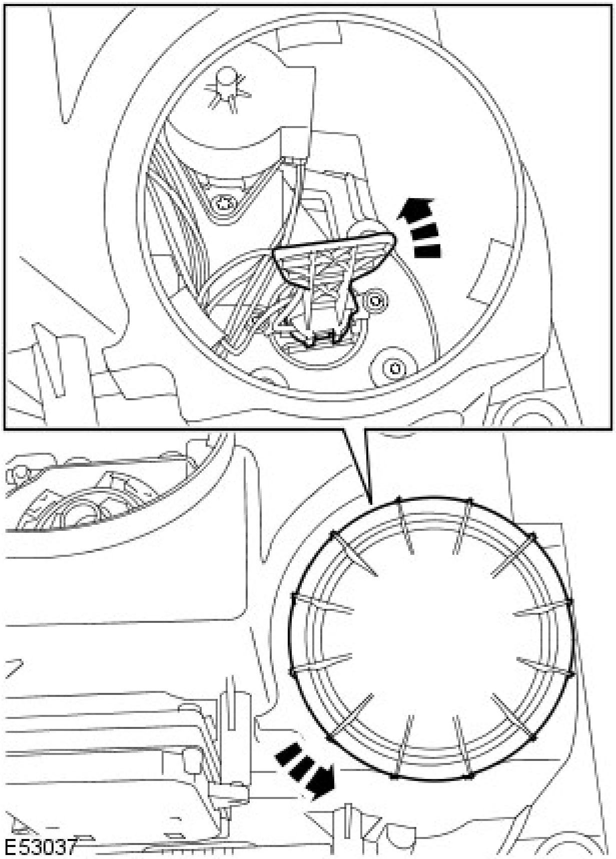
4. NOTE: Do not disassemble further if the component is removed for access only.

• NOTE: High intensity discharge lamp bulb illustrated.

• NOTE: If installed, leave the Silica Gel sachet in place.

Remove the headlamp bulb.

- Remove the cover.
- Disconnect the electrical connector.
- Release the clip.

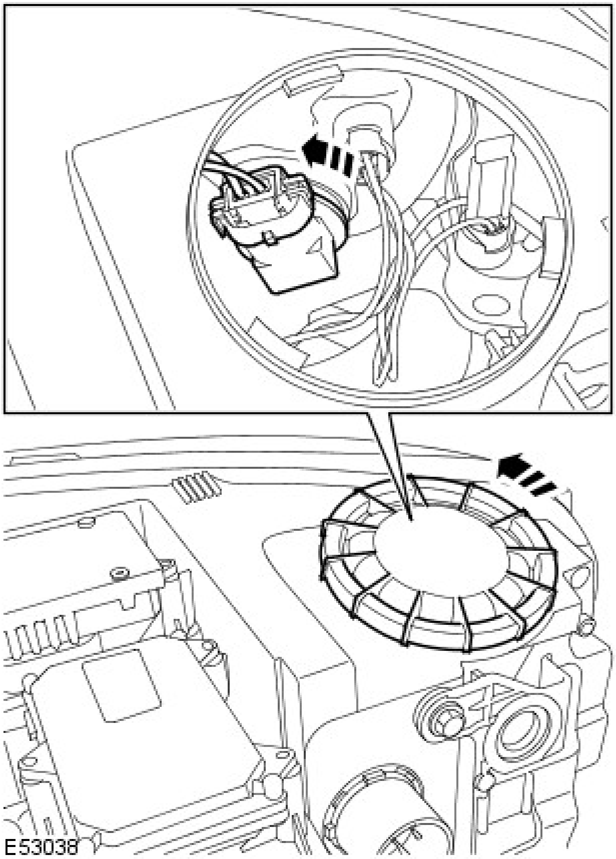


5. Remove the headlamp inner bulb.

- Remove the cover.
- Disconnect the electrical connector.
- Release the clip.

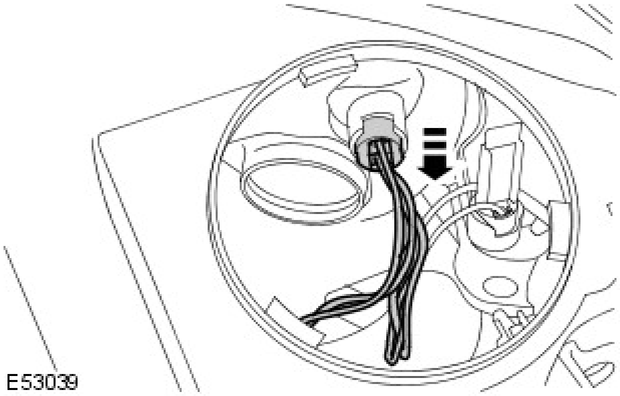
6. Remove the headlamp outer bulb.

- Remove the headlamp outer retaining clip.
- Remove the cover.
- Release the electrical connector.



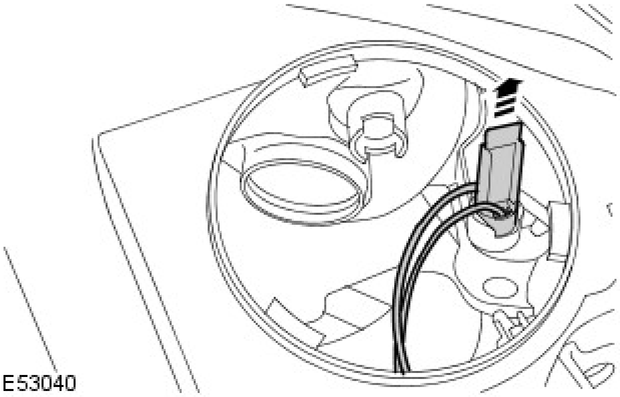
7. Remove the side lamp bulb.

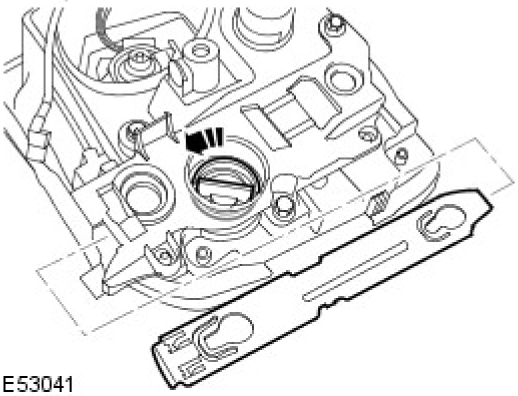
- Release the bulb holder.



8. Remove the side marker bulb.

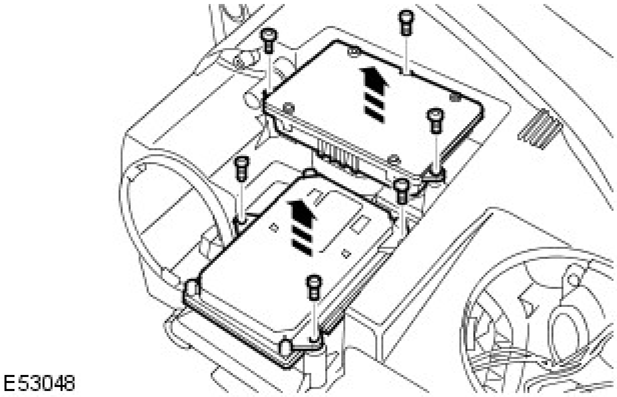
- Release the bulb holder.





9. Remove the turn signal indicator bulb.

- Remove the cover.
- Release the bulb holder.



10. Remove the gas discharge modules.

- Remove the 6 screws.

Installation

1. Install the gas discharge modules.

- Install the screws.

2. Install the turn signal indicator bulb.

- Secure the bulb holder.
- Install the cover.

3. Install the side marker bulb.

- Install the bulb holder.

4. Install the side lamp bulb.

- Install the bulb holder.

5. Install the headlamp outer bulb.

- Connect the electrical connector.
- Install the cover.
- Install the headlamp outer retaining clip.

6. ⚠ CAUTION: Make sure the seal is installed correctly.

Install the headlamp inner bulb.

- Secure with the clip.

- Connect the electrical connector.
- Install the cover.

7. ⚠ CAUTION: Make sure the seal is installed correctly.

Install the headlamp bulb.

- Secure with the clip.
- Connect the electrical connector.
- Install the cover.

8. Install the headlamp assembly.

- Connect the electrical connector.
- Secure with the 2 clips.

9. Install the front radiator grille.
For additional information, refer to: Radiator Grille (501-08 Exterior Trim and Ornamentation, Removal and Installation).

10. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

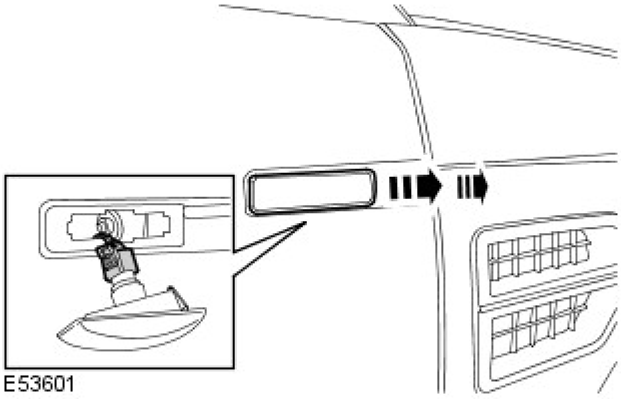
11. NOTE: The headlamp setting is 1.2 % below horizontal and parallel.

Check the headlamp beam alignment.

Exterior Lighting - Side Turn Signal Lamp

Removal and Installation

Removal



1. Remove the side turn signal lamp.
   - Push the lamp forwards to release it from the door.
   - Disconnect the electrical connector.

Installation

1. To install, reverse the removal procedure.

Exterior Lighting - Rear Lamp Assembly

Removal and Installation

Removal

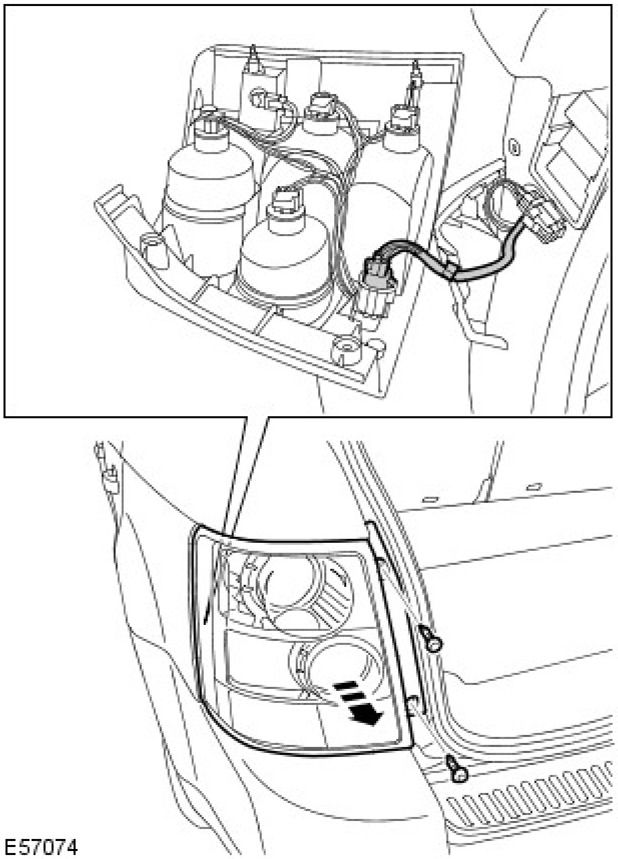
1. Open the liftgate.

2. Release the rear lamp assembly.

- Remove the 2 screws.
- Release the 2 clips.

3. Remove the rear lamp assembly.

- Disconnect the electrical connector.



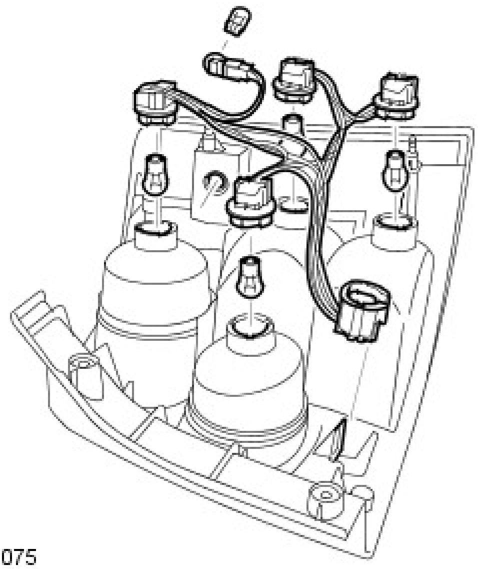
4. NOTE: Do not disassemble further if the component is removed for access only.

• NOTE: Note the fitted position.

Remove the wiring harness.

- Release the 5 bulb holders.
- Release the electrical connector.

5. Remove the 5 bulbs.



E57075

Installation

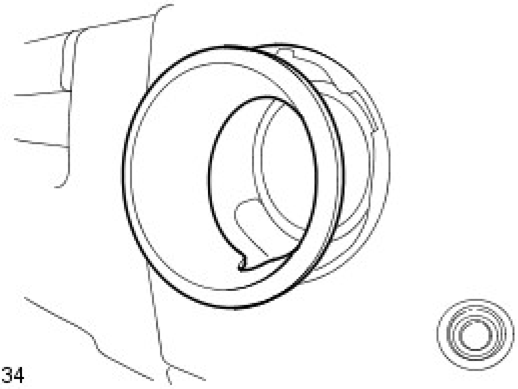
1. Install the bulbs.
2. Install the wiring harness.
   - Install the bulb holders.
   - Install the electrical connector.
3. Install the rear lamp assembly.
   - Connect and secure the electrical connector.
   - Secure the clips.
   - Tighten the screws.
4. Close the liftgate.

Published: 11-May-2011

Exterior Lighting - Front Fog Lamp

Removal and Installation

Removal

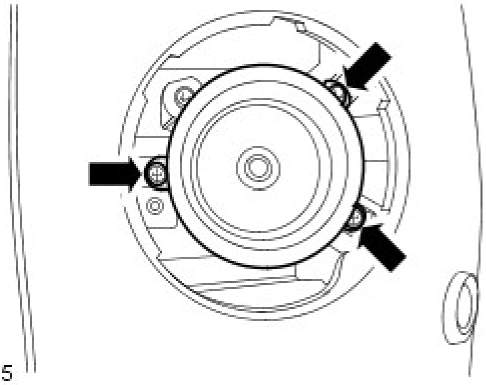


E47034

1. NOTE: Release each clip individually. Clips may fall off if care is not taken.

Remove the front fog lamp bezel.

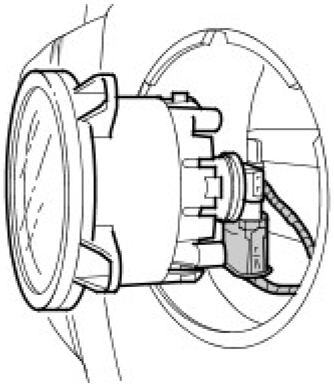
- Release the 6 clips.



E47035

2. Release the front fog lamp.

- Remove the 3 screws.



E47036

3. Remove the front fog lamp.

- Disconnect the front fog lamp electrical connector.

Installation

1. Connect the front fog lamp electrical connector.

2. Install the front fog lamp.

- Tighten the screws.

3. Install the front fog lamp bezel.

- Secure the clips.

4. Check the fog lamp beam alignment.

Published: 11-May-2011

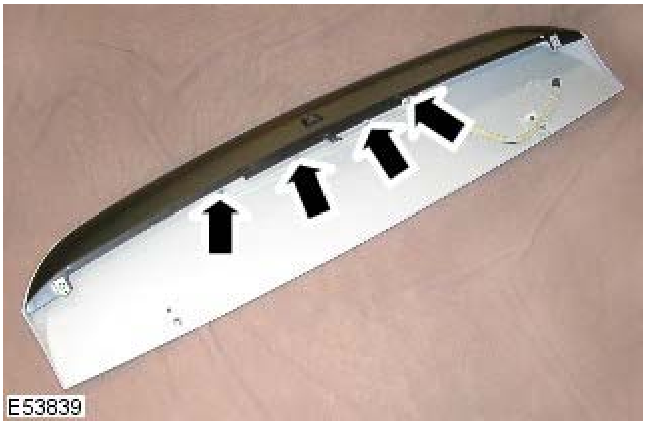
Exterior Lighting - High Mounted Stoplamp

Removal and Installation

Removal

CAUTION: Always protect paintwork and glass when removing exterior components.

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the rear spoiler.
   For additional information, refer to: Rear Spoiler (501-08 Exterior Trim and Ornamentation, Removal and Installation).
3. Remove the high mounted stoplamp.
   - Remove the 4 Torx screws.



Installation

1. Install the high mounted stoplamp.
   - Install the Torx screws.
2. Install the spoiler.
   For additional information, refer to: Rear Spoiler (501-08 Exterior Trim and Ornamentation, Removal and Installation).
3. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Published: 11-May-2011

Exterior Lighting - Adaptive Front Lighting Module

Removal and Installation

Removal

- NOTE: The position of the adaptive front lighting module will change with hand of drive.

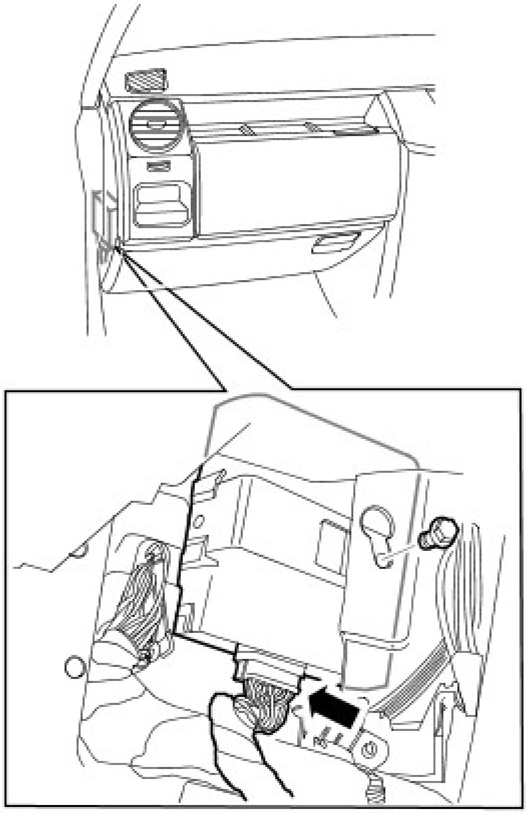
1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Passenger side: Remove the cowl side trim panel.
For additional information, refer to: Cowl Side Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

3. Remove the CJB.
For additional information, refer to: Central Junction Box (CJB) (418-00 Module Communications Network, Removal and Installation).

4. Remove the adaptive front lighting module.

- Disconnect the electrical connector.
- Remove the bolt.



E55696

Installation

1. Install the adaptive front lighting module.

- Tighten the bolt to 10 Nm (7 lb.ft).
- Connect the electrical connector.

2. Install the CJB.
For additional information, refer to: Central Junction Box (CJB) (418-00 Module Communications Network, Removal and Installation).

3. Install the cowl side trim panel.
For additional information, refer to: Cowl Side Trim Panel (501-05

Interior Trim and Ornamentation, Removal and Installation).

4. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

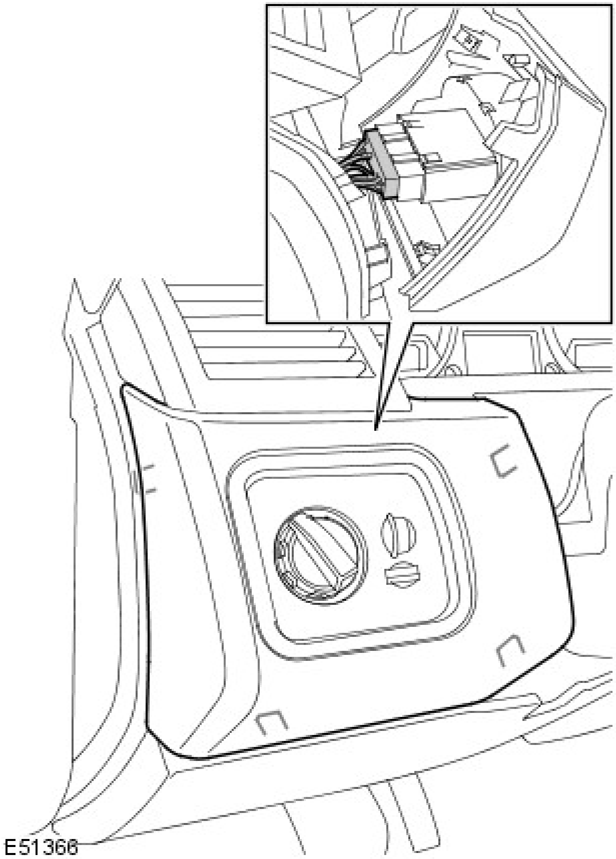
Published: 11-May-2011

Exterior Lighting - Headlamp Switch

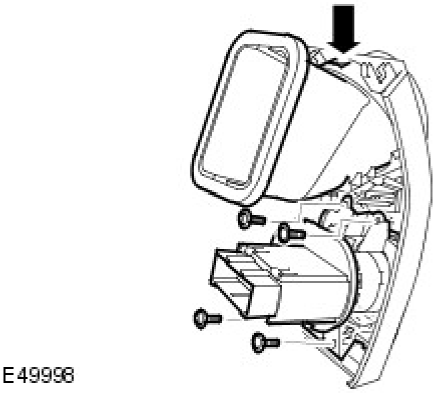
Removal and Installation

Removal

1. Remove the headlamp switch trim panel.
    - Release the 4 clips.
    - Disconnect the electrical connector.



2. Remove the headlamp switch.
    - Remove the 4 Torx screws.



Installation

1. Install the headlamp switch.
    - Tighten the Torx screws.
2. Install the headlamp switch trim panel.
    - Connect the electrical connector.
    - Secure with the clips.

Exterior Lighting - Brake Pedal Position (BPP) Switch Adjustment

General Procedures

1. Adjust the brake pedal position (BPP) switch.

- For vehicles with petrol engine,
  For additional information, refer to: Brake Pedal Position (BPP) Switch Adjustment (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, General Procedures) / Brake Pedal Position (BPP) Switch Adjustment (303-14B Electronic Engine Controls - V8 4.4L Petrol, General Procedures).
- For vehicles with diesel engine,
  For additional information, refer to: Brake Pedal Position (BPP) Switch Adjustment (303-14C Electronic Engine Controls - TDV6 2.7L Diesel, General Procedures) / Brake Pedal Position (BPP) Switch Adjustment (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, General Procedures).

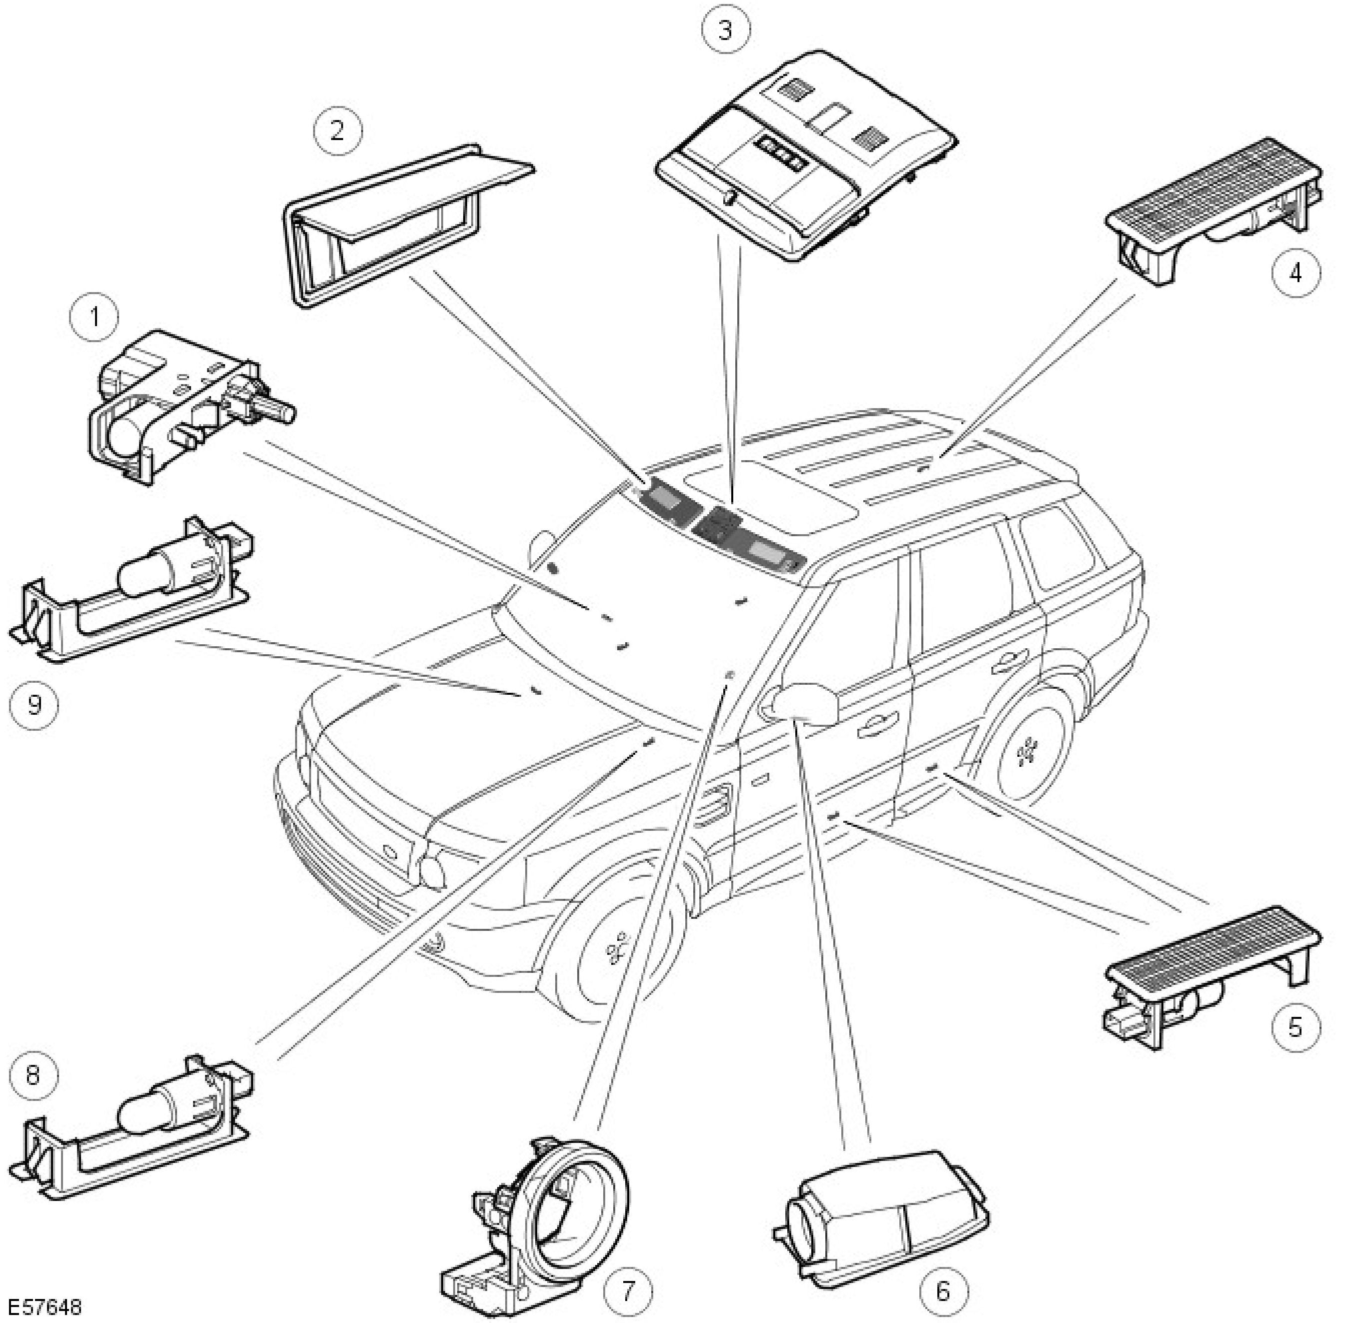
Interior Lighting - Interior Lighting

Description and Operation

Interior Lighting Component Location



Item	Part Number	Description
1	-	Glove compartment lamp and switch
2	-	Vanity mirror lamps
3	-	Main interior lamp and map reading lamps
4	-	Luggage compartment lamp
5	-	Puddle lamps
6	-	Door mirror approach lamps (if fitted)
7	-	Ignition switch glow ring
8	-	Driver footwell lamp
9	-	Passenger footwell lamp

GENERAL

The interior lighting system comprises the following interior lamps:

- Main interior lamp
- Map reading lamps
- Glove compartment lamp
- Luggage compartment lamp
- Vanity mirror lamps
- Footwell lamps
- Puddle lamps
- Ignition switch illumination
- Door mirror approach lamps (if fitted).

Interior Bulb/Type Rating

The following table shows the bulbs used for the interior lighting system and their type and specification.

Bulb	Type	Rating
Main interior lamp	Capless	5W
Map reading lamps	Capless	5W
Luggage compartment lamp	Capless	5W
Vanity mirror lamps	Festoon	14V 0.1A (0.14W)
Door puddle lamps	Capless	5W
Lower instrument panel footwell lamps	Capless	5W
Glove compartment lamp	Festoon	5W
Door mirror approach lamps (if fitted)	Capless	5W

CENTRAL JUNCTION BOX

The Central Junction Box (CJB) is an integrated unit located behind the instrument panel on the passenger side of the bulkhead. The CJB contains fuses, relays and a number of microprocessors which control the power supply and functionality of the interior lighting system and other vehicle systems.

The interior lamps are controlled by the CJB and have two modes of operation: manual and automatic. In the manual mode the interior lamps can be switched on and off using the momentary and latching switches adjacent to each lamp or disabled completely using the same switches. In the automatic mode the interior lamp functionality is controlled by the CJB on receipt of various input signals.

Input signals

The CJB receives the following inputs which affect the operation of the interior lamps:

- Ignition switch
- Door switches
- Tailgate switch
- Glove compartment lamp switch
- Unlock signal
- Main interior lamp switch
- Map reading lamp switches
- Battery saver relay
- Vanity mirror lamp switches.

Circuit Protection

The CJB provides circuit protection for all interior lamp circuits. The following interior lamp circuits are protected by Field Effect Transistors (FETs):

- Main interior lamp
- Luggage compartment lamp
- Footwell lamps
- Ignition switch glow ring
- Door mirror approach lamps (if fitted)
- Puddle lamps.

The above components are protected by FETs which can detect overloads and short circuits. The FETs respond to heat generated by increased current flow caused by a short circuit. On a normal circuit this would cause the fuse to blow, rendering that component and circuit inoperative. The FETs respond to the heat increase and disconnect the supply to the affected circuit. When the fault is rectified or the FET has cooled, the FET will reset and operate the circuit normally.

The following interior lamps circuits are protected by Fuse 1P (10A) in the CJB:

- Glove compartment lamp
- Map reading lamps
- Vanity mirror lamps.

Interior Lamp Time-out

The interior lamps are controlled by a timer within the CJB which allows a 60 second delay period for the lamps to remain on after the ignition has been switched off or when the vehicle is unlocked. The following interior lamps are subject to the delay period:

- Main interior lamp
- Footwell lamps
- Luggage compartment lamp
- Puddle lamps
- Door mirror approach lamps (if fitted)
- Ignition switch glow ring.

The delay period can be adjusted to suit the driver's requirements, refer to following section for adjustment details.

The time-out delay is activated when the CJB receives one of the following signals:

- The CJB receives an unlock signal from the remote handset
- Ignition switch is moved from the crank position (III) or the ignition position (II) or to the auxiliary position (I) to the off position (0).

If a second occurrence of one of the above actions occurs within the time-out period, the timer will be reset and the delay period will start again.

The time-out delay is deactivated when the CJB receives one of the following signals:

- The CJB receives a lock signal from the remote handset
- Ignition switch is moved from the off position (0) or the auxiliary position (I) to the ignition position (II) or the crank position (III).
- The CJB receives a door opened signal (even if door is subsequently closed)

Interior Lamp Time-out Personalisation

The vehicle's customer personalisation options allow the driver or a Land Rover authorised dealer to adjust the interior lamp switch-off delay period to suit their specific requirements. The default delay period of 60 seconds can be adjusted to the following values; OFF, 10 seconds, 20 seconds, 40 seconds, 60 seconds, 120 seconds or 240 seconds.

With the vehicle stationary and the ignition switch in any position, pressing the trip computer button on the end of the left hand steering multifunction switch gives access to the Customer Personalisation options. Using the audio search buttons on the steering wheel the options can be scrolled through. The options are displayed in the message center. When the interior lamp delay option is reached the settings can be changed using the audio search buttons on the steering wheel. When the selection has been made, confirmation is performed by pressing the trip computer button.
For additional information, refer to: Information and Message Center (413-08 Information and Message Center, Description and Operation).

Battery Saver

The battery saver feature provides automatic shut-off of the interior lamps after a period of 15 minutes in order to prevent excessive drain on the battery. The lamp(s) fade off as described in the 'Interior Lighting' section that follows.

The battery saver feature is additional to the time-out delay feature and prevents battery drain when a lamp is accidentally left switched on, e.g. glove compartment left open.

When the ignition switch is moved from the ignition position (II) or the auxiliary position (I) to the off position (0), the CJB starts a timer which automatically switches off all interior lamps when the 15 minute period has expired.

Once the timer has expired and the lamps are off, any one of the following will 'wake-up' the battery saver and the interior lamps will function again. The timer will be restarted as soon as an input from one of the following is received by the CJB:

- Ignition switch position changed to auxiliary (I), ignition (II) or crank (III)
- Any door, including the tailgate is opened
- Unlock request is received
- Main interior lamp switch is pressed.

DELIVERY MODE

Delivery mode is set at the factory on vehicles to minimise battery drain. The mode enables the switching off of non-critical electrical components, including the interior lighting. The delivery mode feature can be cancelled by the dealer at pre-delivery inspection using T4.

CRASH ILLUMINATION

When a crash signal is received from the restraints control module, the CJB activates the interior lamps once the vehicle speed has reduced to 5 km/h (3.1 mph). The lamps remain on until they are switched off manually or the crash signal no longer exists. For additional information, refer to: Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) (501-20B Supplemental Restraint System, Description and Operation).

INTERIOR LIGHTING

Interior lighting is provided to enable the safe entry and departure from the vehicle for the driver and passengers in low ambient light conditions, without any manual switching of the interior lamps.

• NOTE: The term interior lamps also includes the door mirror approach lamps (where fitted).

When the interior lighting system switches the interior lamps on, the CJB ramps the lamps on up to full power over a period of 1.3 seconds. When the system switches the lamps off, after the time-out delay period has expired, the CJB fades the lamps off over a period of 2.6 seconds.

The interior lighting system will illuminate the interior lamps when one of the following events occurs:

- The CJB receives an unlock signal from the remote handset
- Any door is opened including the tailgate
- The ignition switch is turned from the ignition position (II) or the auxiliary position (I) to the off position (0).

The interior lighting system will turn off the interior lamps when one of the following events occurs:

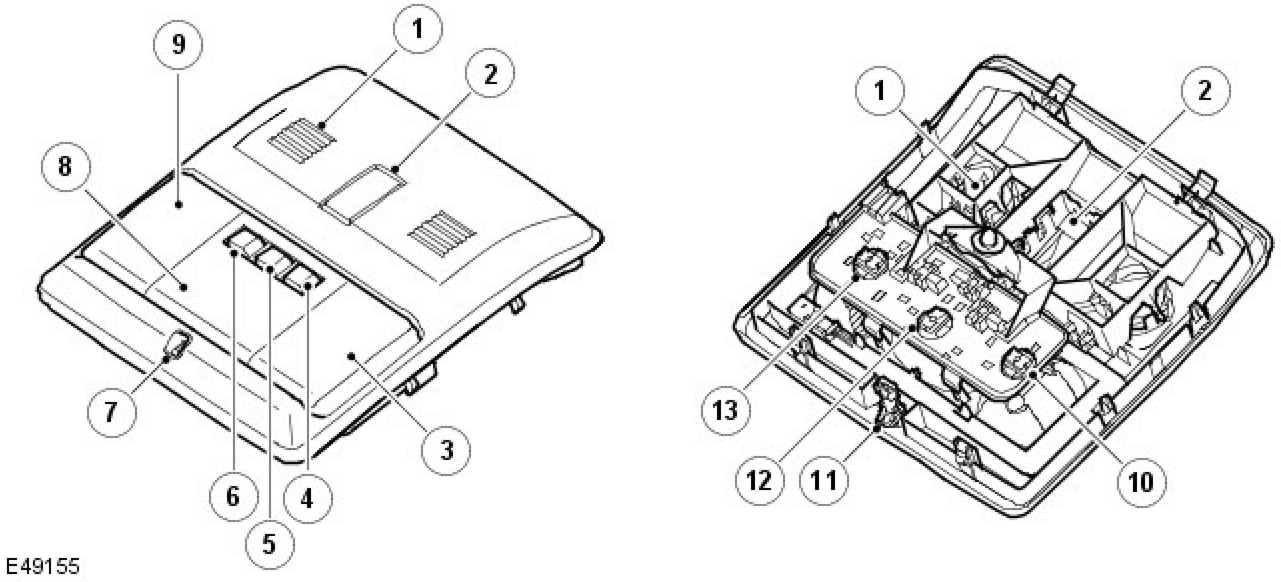
- Once the delay time-out timer has expired since the lamps were either activated or the last door is closed and the vehicle is not locked
- The ignition switch is in the off position (0) and an external lock (using the key or the remote handset) is requested with all doors closed
- The ignition switch is turned from the off position (0) or the auxiliary position (I) to the ignition position (II) with all doors closed
- The last door is closed and the vehicle is externally locked on receipt of an unlock request from the ignition key or a manual unlock using the ignition key in the drivers door lock when the time-out timer is still active
- The last door is closed when the ignition switch is in the ignition position II.

Hunting Mode

The interior lamps can be permanently switched off, preventing automatic operation when a door is opened or the vehicle is unlocked using the remote handset. This is achieved by pressing and holding the central switch of the main interior lamp for 5 seconds. All of the interior lamps, with the exception of the approach lamps, will remain off until the procedure is repeated.

MAIN INTERIOR LAMP ASSEMBLY

Main Interior Lamp



Item	Part Number	Description

1	-	Microphone
2	-	Sunroof switch
3	-	Map reading lamp
4	-	Map reading lamp switch
5	-	Main interior lamp switch
6	-	Map reading lamp switch
7	-	Waterfall lighting LED
8	-	Main interior lamp
9	-	Map reading lamp
10	-	Map reading lamp bulb holder
11	-	LED connector
12	-	Interior lamp bulb holder
13	-	Map reading lamp bulb holder

The main interior lamp assembly is common to all models. The lamp assembly has three switches; one for the main interior lamp and two for the map reading lamps.

The main interior lamp is located in a housing which can also contain the sunroof switch and/or the voice activation microphones, depending on specification.

The main interior lamp operates as part of the automatic interior lighting system. The map reading lamps only operate manually.

Both the interior and map reading lamps use 5W capless bulbs.

The main interior lamp unit also contains an LED for the waterfall lighting. Waterfall lighting is part of the lighting control switch functionality which also controls the brightness of the switch and instrument cluster display illumination. Waterfall lighting provides very limited illumination for the center of the fascia and the center console, when the vehicle is being driven, without affecting the driver's night vision.

Main Interior Lamp

The main interior lamp operates independently of the ignition switch position and can be operated automatically by one of a number of inputs to the CJB or manually by pressing the central switch on the lamp assembly. The switch is a momentary switch which is connected directly to and completes a circuit to the CJB. This completed circuit is a signal for the CJB to activate or deactivate the main interior lamp. The lamp will remain on until the switch is pressed a second time.

The interior lamps can be permanently switched off as previously described in 'Hunting Mode'.

Map Reading Lamps

The main interior lamp assembly contains map reading lamps which are located adjacent to the main interior lamp. The lamps are operated by two momentary switches on the lamp unit, which are located on either side of the main interior lamp switch.

GLOVE COMPARTMENT LAMP

The glove compartment lamp is located inside the glove compartment and contains an integral switch. The switch is operated when the glove compartment lid is opened and closed, switching the lamp on and off.

The glove compartment lamp uses a 5W festoon bulb.

PUDDLE LAMPS

Each door is fitted with a puddle lamp which illuminates the ground below the door when the door is opened. The puddle lamps are located in the bottom of the door trim panel on each front and rear door.

The puddle lamps are part of the automatic interior lighting functionality. Each lamp uses a 5W capless bulb.

FOOTWELL LAMPS

Two footwell lamps are located under the instrument panel, one on each side, to illuminate the footwell area. The footwell lamps are controlled by the CJB and operate as part of the interior lighting functionality.

The footwell lamps use a 5W capless bulb.

LUGGAGE COMPARTMENT LAMP

A luggage compartment lamp is located in the right hand 'D' post trim. The luggage compartment lamp is controlled by the CJB and operates as part of the interior lighting functionality.

The luggage compartment lamp uses a 5W capless bulb.

VANITY MIRROR LAMPS

Four vanity mirror lamps are fitted, two in each vanity mirror. The lamps are illuminated when the mirror cover is raised. The vanity mirror lamps operate independently of the ignition switch position and separately to the interior lighting functionality, although they are subject to the battery saver feature of the CJB.

The vanity mirrors use low voltage, 1.2W festoon type bulbs.

EXTERIOR DOOR MIRROR APPROACH LAMPS (if fitted)

A door mirror approach lamp is located on the underside of each exterior door mirror. The approach lamps are controlled by the CJB and operate on receipt of an unlock request from the ignition key or a manual unlock using the ignition key in the drivers door lock.

The approach lamps remain illuminated for the same period as the interior lamps and are subject to the same interior lamp time-out as detailed earlier.

The approach lamps use 5W capless bulbs.

Diagnosis and Testing

Overview

For information on the description and operation of the system:
REFER to: Interior Lighting (417-02 Interior Lighting, Description and Operation).

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious electrical faults.

Visual Inspection Chart

Mechanical	Electrical
● Main interior lamp condition and installation ● Map reading lamp(s) condition and installation ● Vanity mirror lamp(s) condition and installation ● Glove compartment lamp condition and installation ● Footwell lamp(s) condition and installation ● Ignition switch glow ring condition and installation ● Door mirror approach lamp(s) condition and installation ● Puddle lamp(s) condition and installation ● Luggage compartment lamp condition and installation	● Bulbs ● Fuses - Battery junction box (BJB) - link 15E - BJB - link 11E - Central junction box (CJB) - Fuse 1P ● BJB ● CJB ● Battery saver relay ● Wiring harness ● Loose or corroded connector(s) ● Main interior lamp switch ● Map reading lamp switches ● Vanity mirror lamp switches ● Glove compartment lamp switch ● Waterfall lighting LED ● Tailgate lamp switch

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification

Symptom Chart

Symptom	Possible causes	Action
Main interior lamp inoperative	● Bulb(s) failure ● Fuse(s) blown ● Circuit fault ● Switch fault	Check the bulb(s) condition. Check the fuse(s) (see visual inspection). Check the lamp circuits. Check the switch function. Refer to the electrical guides.
Waterfall lighting LED inoperative	● LED failure ● Fuse(s) blown ● Circuit fault	Check the LED condition. Check the LED connector. Check the fuse(s) (see visual inspection). Check the lamp circuits. Refer to the electrical guides.
Map reading lamp(s) inoperative	● Bulb(s) failure ● Fuse(s) blown ● Circuit fault ● Switch fault	Check the bulb(s) condition. Check the fuse(s) (see visual inspection). Check the lamp circuits. Check the switch function. Refer to the electrical guides.
Vanity mirror lamp(s) inoperative	● Bulb failure ● Fuse(s) blown ● Circuit fault ● Switch fault	Check the bulb condition. Check the fuse(s) (see visual inspection). Check the lamp circuits. Check the switch function. Refer to the electrical guides.
Glove compartment lamp inoperative	● Bulb failure ● Fuse(s) blown ● Circuit fault ● Switch fault	Check the bulb condition. Check the fuse(s) (see visual inspection). Check the lamp circuits. Check the switch function. Refer to the electrical guides.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to

the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
B1C4323	Master Interior Light Switch	● Signal stuck - Switch held ● Interior lamp circuit short to ground ● Interior lamp switch fault	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the interior lamp circuit. Check the switch operation, renew as necessary.
B1C9511	Approach Lamps Circuit	● Approach lamps circuit short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Where installed, refer to the electrical guides and check the approach lamps circuit and repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C9515	Approach Lamps Circuit	● Approach lamps circuit short circuit to power	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Where installed, refer to the electrical guides and check the approach lamps circuit and repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1D1311	Interior Lights Circuit "A"	● Interior lamps A circuit short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair as necessary.
B1D1315	Interior Lights Circuit "A"	● Interior lamps A circuit short circuit to power	Refer to the guided diagnostic routine for this code on the approved diagnostic system. If no customer complaint issue exists with interior lamp operation, no action necessary, clear/ignore DTC. If interior lamp functionality is incorrect, refer to the electrical guides and check the circuit, repair as necessary.
B1D1411	Interior Lights Circuit "B"	● Interior lamps B circuit short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the electrical guides and check the circuit, repair as necessary.
B1D1415	Interior Lights Circuit "B"	● Footwell/puddle lamps not installed ● Bulb failure ● Fuse(s) blown ● Circuit fault	Check for installation of footwell/puddle lamps. If lamps are NOT installed, ignore this DTC. If lamps are installed, refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the condition of the bulbs/fuses. Refer to the electrical circuit diagrams and check lamp circuits for short, open circuit

Daytime Running Lamps (DRL) - Daytime Running Lamps (DRL)

Description and Operation

Daytime Running Lamps (DRL) use the full intensity low beam headlamps which are permanently illuminated when the vehicle is being driven. DRL are used in a number of markets and there are two systems to cover these markets.

DRL CANADIAN MARKET

DRL for this market use full intensity low beam headlamps. The side marker lamps, tail lamps and license plate lamps will be on, but instrument cluster illumination will be off. DRL are active when the following parameters are met:

- Parking brake is off on vehicles with manual transmission or PARK is not selected on vehicles with automatic transmission
- Ignition switch is in the ignition position (II)
- The Central Junction Box (CJB) receives an engine running signal
- The lighting control switch is in the off or side lamps position.

• NOTE: If the lighting control switch is moved to the headlamp position, DRL are deactivated and normal side lamp and headlamp functionality is operational.

• NOTE: Adaptive Front lighting System (AFS) (where fitted) is non-functional when the DRL are active.

• NOTE: When DRL are active, the headlamp flash function using the left hand steering column multifunction switch will operate normally. The high beam headlamp function using the left hand steering column stalk switch will be deactivated.

When the parking brake is applied on manual transmission vehicles or the selector lever is in the PARK position on automatic transmission vehicles, DRL are turned off. This is to reduce battery discharge during long periods of engine idling in cold climate conditions. When the parking brake is released or the selector lever is moved from the PARK position, normal DRL functionality is restored.

DRL DENMARK, HOLLAND, NORWAY, SWEDEN, FINLAND & POLAND

DRL for these markets use full intensity low beam headlamps. Side lamps and license plate lamps will be on, but instrument cluster illumination will be off. DRL are active when the following parameters are met:

- Ignition switch is in the ignition position (II)
- The CJB receives an engine running signal
- The lighting control switch is in the off position.

• NOTE: When DRL are active, the headlamp flash function using the left hand steering column multifunction switch will operate normally. The high beam headlamp function using the left hand steering column stalk switch will be deactivated.

If the lighting control switch is moved to the side lamp or headlamp positions, DRL are deactivated and normal side lamp and headlamp functionality is operational.

13	-	engine control module (ECM)

A number of different types of data bus are incorporated into the vehicle wiring harnesses for the transmission of commands and information between control modules. The bus configuration installed on a particular vehicle depends on the model and equipment level.

The available types of bus systems on the vehicle are:

- High speed controller area network (CAN) bus
- Medium speed CAN bus
- Media Orientated System Transport (MOST) bus
- Gigabit Video Interface (GVIF)
- Local Interconnect Network (LIN) bus
- Security Local Interconnect (SLIN) bus
- Ai Net

Bus	Baud rate	Protocol
High speed CAN	500 kbits/s	11898
Medium speed CAN	125 kbits/s	11898
MOST	24 Mbits/s	MOST Cooperation
GVIF	1.95 Gbits/s	Sony proprietary system
LIN	9.6Kbits/s	LIN consortium
SPDIF	24 kbits/s	Sony/Phillips proprietary system
Ai Net	1200kbits/s	Alpine proprietary system

CAN

The CAN bus is a high speed broadcast network where the control modules automatically transmit information on the bus every few microseconds. The other buses are low speed networks which are mainly event driven, i.e. an electronic control module outputs a message only in response to a request message from another control module or a hard wired input from a switch or sensor.

A twisted pair of wires are used for the CAN bus and single wires are used for all of the other buses. Bus wires can be repaired using crimped connections. The unwound length of CAN bus wires must not exceed 40 mm (1.6 in).

Two CAN busses are employed on the vehicle:

- Medium speed (MS)
- High speed (HS)

The medium speed bus connects the following control modules:

- Integrated Head Unit (IHU) or low line head unit
- Heating and ventilation control module
- Fuel fired booster heater
- Parking aid control module
- TPMS control module
- CJB

The high speed bus connects the following control modules:

- Steering angle sensor
- Air suspension
- Electric Park Brake (EPB) control module
- Electronic rear differential control module
- Terrain Response™
- RCM
- ECM
- TCM
- Adaptive Front lighting System (AFS) module
- ABS module.

Both the medium and high speed CAN bus are connected to the instrument cluster and the diagnostic socket at one end. The medium speed bus terminates at the CJB, while the high speed bus terminates at the ABS control module.

Control modules are connected in either a loop , CAN in/ CAN out, or a spur configuration. Should a control module that is looped fail, the bus system will fail at that point. Should a spurred control module fail the rest of the bus system will be unaffected by the faulty control module.

Media Orientated System Transport (MOST)

The MOST bus uses a fibre optic cable to transport data and audio around the entertainment and information system. The fibre optic cable is arranged in a ring, with each unit on the bus having a MOST in and MOST out connection.

MOST is a synchronous network. A timing master supplies the clock and all other devices synchronize their operation to this clock. The timing master for the MOST network is the Integrated Head Unit (IHU).

Key features of the MOST network are:

- High data transfer rate
- Support for up to 64 devices
- Support of asynchronous and synchronous data transfer
- Reduced cabling
- Simple connectors

When handling the MOST fibre optic cables the following safety precautions should be observed:

- The cable has a minimum bend radius of 25mm.
- It is advisable not to look directly into the connector of a live cable.
- The MOST cable cannot be repaired, replacement overlay harnesses are available to replace damaged cables.

Gigabit Video Interface (GVIF)

The GVIF bus is a Sony proprietary bus for the transmission of video between a transmitter device and a display device. In this instance it is used to transmit video from the navigation computer to the Touch Screen Display (TAD) only.

Local Interconnect Network (LIN) bus

There are two LIN buses on the vehicle. One connects the rain sensor, roof opening panel and memory seats to the central junction box and the other connects the BBUS to the CJB.

The LIN bus has a master/ slave configuration. Within the master is stored a 'schedule table'. This is a list of all the LIN frames or packets in order of which one gets sent when and how many times within a particular cycle. The master sends out a header on the bus which will identify to the slaves whose turn it is to transmit a frame. The slave then fills the space after the header with the contents of the frame. The frame identifiers are all sourced from the LIN specification, and the frame identifiers are grouped by the size of the frame in bytes. All the LIN nodes are optional fit, consequently there is a different schedule table for each permutation. The bus master switches between these based on the information held within the car configuration file. The CJB also acts as a bi-directional gateway between the medium speed CAN bus and the LIN bus by passing signals between the two buses.

The LIN bus is a single wire and operates at 9.6Kbs. The protocol used on the LIN bus is defined by the LIN consortium.

Sony Philips Digital Interface Format (SPDIF)

The SPDIF is an digital optical system connected between the digital versatile disc (DVD) autochanger and the audio amplifier and is used to output the audio from the DVD autochanger to the audio amplifier.

Diagnostic Socket

The diagnostic socket allows the transfer of information between the vehicle electronic control modules and T4 on the high or medium speed CAN bus, or indirectly via the instrument cluster. The diagnostic socket is located in the lower instrument panel closing panel, on the drivers side below the steering column.

IS Bus

The IS bus is a dedicated bus system used to transfer information between the RSE module and the two RSE screens.

Ai Net

The Ai Net is an Alpine proprietary bus used to communicate between the RSE module and the DVD autochanger.

Published: 11-May-2011

Module Communications Network - Communications Network

Diagnosis and Testing

Principles of Operation

For a detailed description of the Communications Network, refer to the relevant Description and Operation sections in the workshop manual. REFER to:

> Communications Network (418-00 Module Communications Network, Description and Operation),
> Communications Network (418-00 Module Communications Network, Diagnosis and Testing),
> Communications Network (418-00, Diagnosis and Testing).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Electrical
● Fuses (refer to electrical guide) ● Wiring harness ● Correct engagement of electrical connectors ● Loose or corroded connections ● Routing of fibre optic harnesses ● Correct engagement of optical connectors ● Correct placement of optical connectors (ring order) ● Correct assembly of optical connectors (backout, etc) ● Damage to fibre (chafing, abrasion, kinking, cuts, etc)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

CAN Network Integrity Checks

In the event that one or more control modules are not communicating on either the Medium Speed (MS) or High Speed (HS) CAN Buses, checks can be performed to confirm the integrity of the CAN harness.

The following information is applicable to HS and MS CAN Buses accessible via the J1962 diagnostic connector.

Module Connections to the CAN Harness

Modules are connected to the CAN harness either in a 'loop' or 'spur' configuration. In the 'loop' type configuration the CAN harness loops into the module (via two connector pins) and then loops out of the module (via another two connector pins). In the 'spur' type configuration, a harness spur is spliced into the main 'backbone' of the CAN harness and the module is connected to the harness spur via two connector pins.

CAN Harness Architecture

For a detailed description of the CAN Networks and architecture, refer to the relevant Description and Operation section in the Workshop Manual. REFER to:

> Communications Network (418-00 Module Communications Network, Description and Operation),
> Communications Network (418-00 Module Communications Network, Diagnosis and Testing),
> Communications Network (418-00, Diagnosis and Testing).

IDS Vehicle Integrity Test

If a control module is suspected of non-communication, the Network Integrity test application available on the manufacturer approved diagnostic system can be used to confirm if communication is possible between the control modules on the vehicle and the manufacturer approved diagnostic system (via the J1962 diagnostic connector). The results from the test can be used to determine if either a single module or multiple modules are failing to communicate.

CAN Terminating Modules

If the Network Integrity test indicates that one or more module on one of the CAN networks (HS or MS) are failing to communicate, there are several checks that can be made. The first step is to identify if both of the CAN terminating modules on each individual CAN Bus are communicating. If both CAN terminating modules for each individual CAN Bus are communicating (identified via the Network Integrity test), then it can be confirmed that the main 'backbone' of the CAN harness is complete. The main 'backbone' of the CAN harness consists of all the modules connected to the CAN harness via a 'loop' configuration and also includes the two terminating modules.

Communication with both CAN terminating modules via the Network Integrity test confirms the physical integrity of the main 'backbone' of the CAN harness (and the harness spur to the J1962 diagnostic connector). This means that there is no requirement to check the resistance of the CAN Network. This is because the standard check for 60 ohms across the CAN High and CAN Low lines will not provide any additional information regarding the physical condition of the CAN harness, beyond what has already been determined from the Network Integrity test.

Non-Communication of a Terminating Module

If a Network Integrity test reveals a terminating module is failing to communicate it can indicate a break in the main 'backbone' of the CAN harness. The first checks should always be to confirm the power and ground supplies to the non-communicating module are correct. Providing these are correct, the resistance between the CAN High and CAN Low lines at the J1962 connector can be checked to determine the integrity of the main 'backbone' of the CAN harness. After disconnecting the battery a reading of 120 ohms would indicate an open circuit in the main 'backbone' of the CAN harness. Alternatively, a reading of 60 ohms would indicate that there is no open circuit fault with the main 'backbone' of the CAN harness.

It is worth noting that even if one of the terminating modules is disconnected from the CAN harness, communications between the modules still connected may still be possible. Therefore communication between the manufacturer approved diagnostic system and the connected modules may also be possible.

Locating CAN Harness Open Circuits

In the case where multiple modules, including a terminating module, are failing to communicate, having first confirmed the power and ground supplies are correct, the approximate location of the open circuit can be identified from analysis of the Network Integrity test results and reference to the relevant CAN network circuit diagrams. For example, if an open circuit existed in a certain position on the CAN harness, any module positioned on the Network between the J1962 connector and the open circuit should return a response during the Network Integrity test. No responses would be returned from any modules past the open circuit fault in the Network.

CAN Harness 'Spur' Type Configuration Circuits

If, after the initial checks (Network Integrity test using the manufacturer approved diagnostic system, and power and ground supplies to the module have been checked and confirmed as correct), a module that is connected to the CAN harness via a 'spur' type configuration is suspected of not communicating, then the physical integrity of the CAN harness 'spur' can be checked.

This is most easily undertaken by individually checking the continuity of the CAN High and CAN Low lines between the non-communicating module connector (with the module disconnected) and the J1962 diagnostic connector.

'Lost Communications' DTCs

As well as the methods described so far in this document, which can be used to determine the location of an open circuit in the CAN harness, 'Lost Communications' DTCs can also be used for this purpose. Lost communication DTCs mean that a module is not receiving CAN information from another module.

For example, if a global DTC read were to be carried out, only DTCs stored in the modules that the manufacturer approved diagnostic system could communicate with would be displayed. If there was an open circuit fault in a certain position on the CAN harness, the modules that could display DTCs would all be prior to the open circuit on the Network, and these modules should display 'Lost Communications' DTCs with all the modules located on the Network past the open circuit fault.

'Bus off' DTCs

The references to bus and its condition refer to the network concerned and the modules on that network.

If a module logs a 'Bus Off' DTC, it means that the module has detected CAN transmission errors and has disabled its's own CAN transmissions and disconnected itself from the network in an attempt to allow the rest of the network to function. At this point the 'Bus Off' DTC is set. A common cause of 'Bus Off' DTCs can be a short circuit in the CAN network.

Media oriented systems transport (MOST) diagnosis

Overview

The basic guidelines are covered in the description and operation section, such as not attempting to repair fibre optic cables, but additional precautions include:

- Do not touch the exposed ends of the optical fibres (grease from skin can contaminate the fibre)

- Whenever the fibre optic cable is disconnected, cover the connectors to prevent dust contamination
- Do not expose the fibre optic cable to heat
- Do not bend the fibre optic cable through less than a 25 mm (one inch) radius
- Do not use laser pens to test the fibre optic cable's ability to pass light
    - There is a dedicated tester to use with the MOST network modules and fibre optic harness to assist with diagnosis and to test the fibre optic cable's ability to pass light

MOST tester

Before connecting the tester to the network, turn on the unit and check that the red **power on** indicator is illuminated.

If not, the battery should be replaced before using the tester.

2+0 Self-test

1. **1.** Set the connector selector switch to 2+0.
2. **2.** Select **beep** or **LED** on the tester, depending on your choice of indicator.
3. **3.** Turn the tester on and check the operation of the power indicator.
4. **4.** Using the 2+0 loop-back lead from the kit, push it into the 2+0 connector housing in the tester until it clicks into place.
5. **5.** Press the red **test** button in the center of the tester.
6. **6.** Depending on your choice in step 2, the tester will give either an audible tone or a green light.
    - If the tester continues to give a tone or light after the test button is released this does not indicate a fault, only that there is a signal feed-back within the tester which will stop when the loop-back lead is removed.

2+4 Self-test

Carry out the self-test in the same way as for 2+0, but using the 2+4 loop-back lead and select 2+4 on the connector selector switch.

Vehicle diagnosis

⚠CAUTION: Make sure the tester is not connected to the MOST network when either switching the tester on or switching between 2+0 and 2+4, as the tester emits a brief pulse of light which could introduce a fault into the network.

7. **7.** Use the approved diagnostic system or a scan tool to retrieve any DTCs.
8. **8.** Set the connector selector switch to **2+0**.
9. **9.** Disconnect the intermediate fibre optic cable connector and connect the male half to the tester connector at the top of the unit using the adaptor in the kit.
10. **10.** Turn the tester on and check the operation of the power indicator.
11. **11.** Set the **LED/beep** selector to **LED**.
12. **12.** Turn the ignition switch to the **ON** position.
13. **13.** If the green LED is active, a signal has been received indicating that the first half of the optical ring is functioning.
14. **14.** If the green LED is **NOT** active, no signal has been received indicating that the first half of the optical ring is **NOT** functioning.
    - A ring break code should be set as a result of this. Use the approved diagnostic system to trace the fault and clear the code.

DTC INDEX

Central Junction Box (CJB)

⚠CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

DTC	Description	Possible cause	Action
B118662	Tailgate Power Striker Signal Compare Failure	● Power striker circuit short or open circuit ● Power striker unit fault ● Internal CJB fault	Refer to the electrical guides and check the power striker circuit. Check the operation of the power striker unit. If the fault persists, suspect an internal fault with the CJB. If no other DTCs are present, ignore this fault.
B11C312	Power Striker Open Relay	● Power striker open relay circuit short circuit to power, over-temperature or open load	Refer to the electrical guides and check the circuit, repair as necessary.
B1A0016	Control Module	● Control module circuit voltage below threshold: - Voltage less than (master control module voltage - 2V) for > 10 seconds	Check the power supply and ground connections for the relevant module.
B1A9074	Sunroof Moves Too Slowly	● Roof opening panel actuator slipping (mechanical problem)	Inspect/renew the roof opening panel actuator as necessary.
B1A9131	Speed/Position Sensor A	● Roof opening panel sensor wiring circuit open or short circuit ● Roof opening panel position sensor failure	Refer to the electrical guides and check the circuit from the roof opening panel control module to the roof opening panel motor for open or short circuit. Renew the motor/roof opening panel as necessary.
B1A9231	Speed/Position Sensor B	● Roof opening panel sensor wiring circuit open or short circuit ● Roof opening panel position sensor failure	Refer to the electrical guides and check the circuit from the roof opening panel control module to the roof opening panel motor for open or short circuit. Renew the motor/roof opening panel as necessary.
B1A9393	Invalid Roof Position	● Roof opening panel position beyond expected range ● Roof opening panel sensor wiring circuit open or short circuit ● Roof opening panel position sensor failure	Clear the DTC and check the operation of the roof opening panel. Refer to the electrical guides and check the circuit from the roof opening panel control module to the roof opening panel motor for open or short circuit. Renew the motor/roof opening panel as necessary.
B1A9801	LIN Bus Circuit #1	● LIN Bus short circuit to power or ground	The LIN Bus is the serial link to the rain sensor, sunroof, memory seat modules which are optional install items, but the control of the DTC logging is determined from the car configuration file (CCF) (installed or not). Repair action only required if one or more items installed and not functioning correctly.
B1A9881	LIN Bus Circuit #1	● Software error ● Rain/ambient light sensor lost power during transmission	No repair action necessary unless customer complains of rain sensor, roof opening panel or memory seat not functioning correctly. The LIN Bus is the serial link to the rain sensor, sunroof, memory seat modules which are optional install items, but the control of the DTC logging is determined from the car configuration file (CCF) (installed or not). Repair action only required if one or more items installed and not functioning correctly.
B1A9883	LIN Bus Circuit #1	● LIN Bus check sum error	The LIN Bus is the serial link to the rain sensor, sunroof, memory seat modules which are optional install items, but the control of the DTC logging is determined from the car configuration file (CCF) (installed or not). Repair action only required if one or more items installed and not functioning correctly.
B1A994C	Power On Reset	● Central junction box (CJB) power supply or battery reconnected	No action necessary, clear/ignore DTC.

DTC	Description	Possible cause	Action
B1B0042	Sub-Module 'A'	- Software error - general memory failure	No action necessary, clear/ignore DTC.
B1B0044	Sub-Module 'A'	- Software error - data memory failure	No action necessary, clear/ignore DTC.
B1B0045	Sub-Module 'A'	- Software error - program memory failure	No action necessary, clear/ignore DTC.
B1B0047	Sub-Module 'A'	- Software error	No action necessary, clear/ignore DTC.
B1B014A	Key Transponder	Unknown key, key transponder communication error during cranking	No action necessary, clear/ignore DTC.
B1B014C	Key Transponder	- Incorrect transponder key/new key not coded. DTC logged at each ignition cycle until both keys have been learned during programming	Clear DTC and retest.
B1B0146	Key Transponder	- In learn mode, failed to learn key. DTC logged when a key programming operation fails	Complete the key programming procedure and clear DTC.
B1B0166	Key Transponder	- Excessive non-valid key usage - logged when successive multiple codes are used in attempt to discover transponder code	No action necessary, clear/ignore DTC.
B1B0187	Key Transponder	- No communication from key transponder during start event - Rear tail/brake lamp bulb incorrect spec - Rear tail/brake lamp bulb fault	Check for other DTCs. If this DTC is logged along with DTC B1C6012 in the Network Communications Module and DTC C1A5564 in the Park Brake Module, rectify DTC B1C6012 first, clear the DTCs and retest. Check key transponder information and clear DTC.
B1B0228	LF Coil	- Key transponder communication tolerance error	No repair for this DTC, clear and ignore.
B1B0296	LF Coil	- Ignition key transponder coil circuit open or short circuit	Refer to the electrical guides and check the transponder circuit, repair/renew as necessary.
B1B0353	Transponder Key #1	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B0392	Transponder Key #1	- Known key password invalid Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B0396	Transponder Key #1	- Ignition key transponder coil circuit open or short circuit	Refer to the electrical guides and check the transponder coil circuit, repair/renew as necessary.
B1B0453	Transponder Key #2	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B0492	Transponder Key #2	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B0553	Transponder Key #3	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B0592	Transponder Key #3	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.

DTC	Description	Possible cause	Action
B1B0653	Transponder Key #4	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B0692	Transponder Key #4	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B0753	Transponder Key #5	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B0792	Transponder Key #5	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B0853	Transponder Key #6	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B0892	Transponder Key #6	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B0953	Transponder Key #7	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B0992	Transponder Key #7	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B1053	Transponder Key #8	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B1092	Transponder Key #8	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B1153	Transponder Key #9	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B1192	Transponder Key #9	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B1253	Transponder Key #10	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B1292	Transponder Key #10	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B1353	Transponder Key #11	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B1392	Transponder Key #11	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B1453	Transponder Key #12	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.

DTC	Description	Possible cause	Action
B1B1492	Transponder Key #12	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B1553	Transponder Key #13	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B1592	Transponder Key #13	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B1653	Transponder Key #14	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B1692	Transponder Key #14	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B1753	Transponder Key #15	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B1792	Transponder Key #15	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B1853	Transponder Key #16	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B1892	Transponder Key #16	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B1953	Transponder Key #17	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B1992	Transponder Key #17	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B2053	Transponder Key #18	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B2092	Transponder Key #18	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B2153	Transponder Key #19	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B2192	Transponder Key #19	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B2253	Transponder Key #20	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B2292	Transponder Key #20	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.

DTC	Description	Possible cause	Action
B1B2353	Transponder Key #21	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B2392	Transponder Key #21	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B2453	Transponder Key #22	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B2492	Transponder Key #22	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B2553	Transponder Key #23	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B2592	Transponder Key #23	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B2653	Transponder Key #24	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B2692	Transponder Key #24	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B2753	Transponder Key #25	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B2792	Transponder Key #25	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B2853	Transponder Key #26	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B2892	Transponder Key #26	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B2953	Transponder Key #27	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B2992	Transponder Key #27	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B3053	Transponder Key #28	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B3092	Transponder Key #28	- Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B3153	Transponder Key #29	- Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.

DTC	Description	Possible cause	Action
B1B3192	Transponder Key #29	● Known key password invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B3253	Transponder Key #30	● Theft warning - triggered when a known disabled key is used in the ignition	No action necessary, clear/ignore DTC.
B1B3292	Transponder Key #30	● Known key password .invalid - Key transponder communication confirmation error	No action necessary, clear/ignore DTC.
B1B3386	Target ID Transfer	● Failed communication with engine management system	No action necessary, clear/ignore DTC.
B1B3387	Target ID Transfer	● Failed communication with engine management system	No action necessary, clear/ignore DTC.
B1B3486	Target ID Transfer	● Failed communication with engine management system	No action necessary, clear/ignore DTC.
B1B3487	Target ID Transfer	● Failed communication with engine management system	No action necessary, clear/ignore DTC.
B1B3501	RF Scanning Receiver	● Communications with the RF scanning receiver failed	No action necessary, clear/ignore DTC.
B1B551C	Rain Sensor Module	● Rain sensor module supply voltage out of range	Refer to the electrical guides and check the power supply to the sensor module from the CJB, repair as necessary. If the power supply exists, no further action necessary, clear/ignore DTC.
B1B5546	Rain Sensor Module	● Rain sensor module calibration/parameter memory failure: - Initialization error - unable to perform optical calibration	Check the cleanliness of the windscreen in the sensor location. Check for correct installation of the sensor to the optical element and the adherence of the optical element to windscreen. Clear DTC and retest. If DTC persists, renew the rain/ambient light sensor.
B1B5549	Rain Sensor Module	● Rain sensor module internal electronic failure	Renew the rain/ambient light sensor.
B1B5587	Rain Sensor Module	● No response from rain sensor module	Rain sensor is not installed to all variants (optional). Fault logging is inhibited by the CCF, but an incorrectly configured CCF could give erroneous DTC logging. Repair action only required for vehicles with sunroof installed.
B1B5591	Rain Sensor Module	● Rain sensor module - measured temperature outside of normal operating range	No action necessary, clear/ignore DTC.
B1B5646	Sunroof Module	● Roof opening panel control module - calibration/parameter memory failure	Clear the DTC and re-test. If the DTC resets, renew the roof opening panel control module. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
B1B564B	Sunroof Module	● Roof opening panel control module - over temperature (sensor defective or not calibrated)	If no customer complaint issue exists with the roof opening panel operation, no action necessary, clear/ignore DTC. If functionality if affected, refer to the electrical guides and check the control module connector and circuit. Repair as necessary and clear the DTC. If the DTC persists and panel operation is incorrect, renew the control module.
B1B5687	Sunroof Module	● No response from sunroof module	Roof opening panel is not installed to all variants (option). Fault logging is inhibited by the CCF, but an incorrectly configured CCF could give erroneous DTC logging. Repair action only required for vehicles with sunroof installed.
B1B5916	Excessive Continuous Motor Operation	● 5V power supply failure to the seat adjustment sensors	Refer to the electrical guides and check 5V from the seat memory module to the seat motor and circuit. If no 5V supply exists, repair/renew as necessary.

DTC	Description	Possible cause	Action
B1B5968	Excessive Continuous Motor Operation	- Roof opening panel has been operated continuously resulting in a motor overheat event (panel may have stopped working during overheat period)	No action necessary, clear DTC.
B1B6916	12 Volt Supply Circuit	- Software error - Power supply failure from CJB to seat memory module	If no customer complaint issue exists with seat operation, no action necessary, clear/ignore DTC. If seat functionality if affected, refer to the electrical guides and check the memory control module power supply and circuit. Repair as necessary and clear the DTC. If a power supply to the module exists and power outputs from the module are not present, renew the memory module.
B1B7001	LIN Bus Circuit #2	- SLIN Bus short circuit to power or ground	SLIN Bus is the serial link to the battery backed-up sounder (BBUS). This is an optional item, but the control of the DTC logging is determined from the CCF (BBUS installed or not). Repair action only required if BBUS installed and not functioning correctly.
B1B7081	LIN Bus Circuit #2	- SLIN Bus header error	SLIN Bus is the serial link to the battery backed-up sounder (BBUS). This is an optional item, but the control of the DTC logging is determined from the CCF (BBUS installed or not). Repair action only required if BBUS installed and not functioning correctly.
B1B7083	LIN Bus Circuit #2	- SLIN Bus check sum error	SLIN Bus is the serial link to the battery backed-up sounder (BBUS). This is an optional item, but the control of the DTC logging is determined from the CCF (BBUS installed or not). Repair action only required if BBUS installed and not functioning correctly.
B1B8541	Memory Control Module	- Seat module error	Renew the seat memory control module. Refer to the warranty policy and procedures manual if a module is suspect.
B1B8549	Memory Control Module	- Seat module error	If no customer complaint issue exists with seat operation, no action necessary, clear/ignore DTC. If seat functionality is affected, renew module. Refer to the warranty policy and procedures manual if a module is suspect.
B1B8587	Memory Control Module	- No response from seat memory control module	Seat memory is not installed to all variants (optional). Fault logging is inhibited by the CCF, but an incorrectly configured CCF could give erroneous DTC logging. Repair action only required for vehicles with sunroof installed.
B1B8673	Seat Height Motor Relay	- Memory control module internal relay fault (stuck on)	Renew the seat memory control module. Refer to the warranty policy and procedures manual if a module is suspect.
B1B8693	Seat Height Motor Relay	- Software error - Memory control module internal relay fault (inoperative)	If no customer complaint issue exists with seat operation, no action necessary, clear/ignore DTC. If seat functionality is incorrect check/renew the control module as necessary. Refer to the warranty policy and procedures manual if a module is suspect.
B1B8731	Seat Height Motor Speed/Position Sensor	- Wiring circuit/connector issue - Seat height motor speed/position sensor fault	Refer to the electrical guides and check the harness and connections between the seat memory module and the seat height motor. Repair/renew as necessary. If no circuit fault is found check/renew the seat height motor.
B1B873A	Seat Height Motor Speed/Position Sensor	- Seat height moved beyond expected range - Sensor circuit open or short circuit - Seat adjustment range issue - Seat height motor speed/position sensor fault	Refer to the electrical guides and check the harness and connections between the seat memory module and the seat height motor. Repair/renew as necessary. Check the seat adjustment ranges to ensure correct operation. Renew the seat height motor.
B1B8873	Seat Height Motor Relay	- Memory control module internal relay fault (stuck on)	Renew the seat memory control module. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible cause	Action
B1B8893	Seat Slide Motor Relay	● Software error ● Memory control module internal relay fault (inoperative)	If no customer complaint issue exists with seat operation, no action necessary, clear/ignore DTC. If seat functionality is incorrect check/renew the control module as necessary.
B1B8931	Seat Slide Motor Speed/Position Sensor	● Wiring circuit/connector issue ● Seat slide motor speed/position sensor fault	Refer to the electrical guides and check the harness and connections between the seat memory module and the seat slide motor. Repair/renew as necessary. If no circuit fault is found check/renew the seat slide motor.
B1B893A	Seat Slide Motor Speed/Position Sensor	● Seat slide moved beyond expected range - Sensor circuit open or short circuit - Seat adjustment range issue - Seat slide motor speed/position sensor fault	Refer to the electrical guides and check the harness and connections between the seat memory module and the seat slide motor. Repair/renew as necessary. Check the seat adjustment ranges to ensure correct operation. Renew the seat slide motor.
B1B9073	Seat Tilt Motor Relay	● Memory control module internal relay fault (stuck on)	Renew the seat memory control module. Refer to the warranty policy and procedures manual if a module is suspect.
B1B9093	Seat Tilt Motor Relay	● Software error ● Memory control module internal relay fault (inoperative)	If no customer complaint issue exists with seat operation, no action necessary, clear/ignore DTC. If seat functionality is incorrect check/renew the control module as necessary.
B1B9131	Seat Tilt Motor Speed/Position Sensor	● Wiring circuit/connector issue ● Seat tilt motor speed/position sensor fault	Refer to the electrical guides and check the harness and connections between the seat memory module and the seat tilt motor. Repair/renew as necessary. If no circuit fault is found check/renew the seat tilt motor.
B1B913A	Seat Tilt Motor Speed/Position Sensor	● Seat tilt moved beyond expected range - Sensor circuit open or short circuit - Seat adjustment range issue - Seat tilt motor speed/position sensor fault	Refer to the electrical guides and check the harness and connections between the seat memory module and the seat tilt motor. Repair/renew as necessary. Check the seat adjustment ranges to ensure correct operation. Renew the seat tilt motor.
B1B9273	Seat Recline Motor Relay	● Memory control module internal relay fault (stuck on)	Renew the seat memory control module. Refer to the warranty policy and procedures manual if a module is suspect.
B1B9293	Seat Recline Motor Relay	● Software error ● Memory control module internal relay fault (inoperative)	If no customer complaint issue exists with seat operation, no action necessary, clear/ignore DTC. If seat functionality is incorrect check/renew the control module as necessary.
B1B9331	Seat Recline Motor Speed/Position Sensor	● Wiring circuit/connector issue ● Seat recline motor speed/position sensor fault	Refer to the electrical guides and check the harness and connections between the seat memory module and the seat recline motor. Repair/renew as necessary. If no circuit fault is found check/renew the seat recline motor.
B1B933A	Seat Recline Motor Speed/Position Sensor	● Seat recline moved beyond expected range - Sensor circuit open or short circuit - Seat adjustment range issue - Seat recline motor speed/position sensor fault	Refer to the electrical guides and check the harness and connections between the seat memory module and the seat recline motor. Repair/renew as necessary. Check the seat adjustment ranges to ensure correct operation. Renew the seat recline motor.
B1B9473	Seat Height Up Switch	● Seat height up switch stuck ● Seat height up switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the seat switch pack for short to ground. Check the switch operation, renew as necessary.
B1B9573	Seat Height Down Switch	● Seat height down switch stuck ● Seat height down switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the seat switch pack for short to ground. Check the switch operation, renew as necessary.

DTC	Description	Possible cause	Action
B1B9673	Seat Slide Forward Switch	- Seat slide forward switch stuck - Seat slide forward switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the seat switch pack for short to ground. Check the switch operation, renew as necessary.
B1B9773	Seat Slide Backward Switch	- Seat slide backward switch stuck - Seat slide backward switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the seat switch pack for short to ground. Check the switch operation, renew as necessary.
B1B9873	Seat Tilt Up Switch	- Seat tilt up switch stuck - Seat tilt up switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the seat switch pack for short to ground. Check the switch operation, renew as necessary.
B1B9973	Seat Tilt Down Switch	- Seat tilt down switch stuck - Seat tilt down switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the seat switch pack for short to ground. Check the switch operation, renew as necessary.
B1C0073	Seat Recline Up Switch	- Seat recline up switch stuck - Seat recline up switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the seat switch pack for short to ground. Check the switch operation, renew as necessary.
B1C0173	Seat Recline Down Switch	- Seat recline down switch stuck - Seat recline down switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the seat switch pack for short to ground. Check the switch operation, renew as necessary.
B1C0273	Memory Store Switch	- Seat memory store switch stuck - Seat memory store switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the seat switch pack for short to ground. Check the switch operation, renew as necessary.
B1C0373	Memory #1 Switch	- Seat memory #1 switch stuck - Seat memory #1 switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the seat switch pack for short to ground. Check the switch operation, renew as necessary.
B1C0473	Memory #2 Switch	- Seat memory #2 switch stuck - Seat memory #2 switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the seat switch pack for short to ground. Check the switch operation, renew as necessary.
B1C0573	Memory #3 Switch	- Seat memory #3 switch stuck - Seat memory #3 switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the seat switch pack for short to ground. Check the switch operation, renew as necessary.
B1C0601	Driver Up/Down And Common Mirror Motor Circuit	- Mirror motor up/down circuit open or short circuit - Mirror up/down motor failure	Refer to the electrical guides and check the circuit between the memory control module and the door mirror for open circuit or short to ground. Check the mirror operation, renew as necessary.
B1C0701	Driver Left/Right and Right-hand Up/Down Mirror Motor Circuit	- Mirror motor left/right circuit open or short circuit - Mirror left/right motor failure	Refer to the electrical guides and check the circuit between the memory control module and the door mirror for open circuit or short to ground. Check the mirror operation, renew as necessary.
B1C0801	Passenger Left/Right And Common Mirror Motor Circuit	- Mirror motor left/right circuit open or short circuit - Mirror left/right motor failure	Refer to the electrical guides and check the circuit between the memory control module and the door mirror for open circuit or short to ground. Check the mirror operation, renew as necessary.
B1C0973	Driver Left/Right Mirror Motor Circuit	- Software error (DTC can be logged when the mirror is moved manually) - Mirror motor left/right circuit open or short circuit - Mirror left/right motor failure	If no customer complaint issue exists with mirror operation, no action necessary, clear/ignore DTC. If mirror functionality is incorrect, refer to the electrical guides and check the circuit for open of short to ground. Renew the mirror motor/mirror as necessary.
B1C1073	Driver Up/Down Mirror Motor Circuit	- Software error (DTC can be logged when the mirror is moved manually) - Mirror motor up/down circuit open or short circuit - Mirror up/down motor failure	If no customer complaint issue exists with mirror operation, no action necessary, clear/ignore DTC. If mirror functionality is incorrect, refer to the electrical guides and check the circuit for open of short to ground. Renew the mirror motor/mirror as necessary.

DTC	Description	Possible cause	Action
B1C1173	Passenger Left/Right Mirror Motor Circuit	● Software error (DTC can be logged when the mirror is moved manually) ● Mirror motor left/right circuit open or short circuit ● Mirror left/right motor failure	If no customer complaint issue exists with mirror operation, no action necessary, clear/ignore DTC. If mirror functionality is incorrect, refer to the electrical guides and check the circuit for open of short to ground. Renew the mirror motor/mirror as necessary.
B1C1273	Passenger Up/Down Mirror Motor Circuit	● Software error (DTC can be logged when the mirror is moved manually) ● Mirror motor up/down circuit open or short circuit ● Mirror up/down motor failure	If no customer complaint issue exists with mirror operation, no action necessary, clear/ignore DTC. If mirror functionality is incorrect, refer to the electrical guides and check the circuit for open of short to ground. Renew the mirror motor/mirror as necessary.
B1C133A	Driver Up/Down Mirror Motor Feedback Circuit	● Door mirror motor moved beyond expected range - Sensor circuit open or short circuit - Door mirror motor position sensor fault	Refer to the electrical guides and check the harness and connections between the seat memory module and the mirror. Repair/renew as necessary. Check/renew the mirror motor/assembly.
B1C143A	Driver Left/Right Mirror Motor Feedback Circuit	● Door mirror motor moved beyond expected range - Sensor circuit open or short circuit - Door mirror motor position sensor fault	Refer to the electrical guides and check the harness and connections between the seat memory module and the mirror. Repair/renew as necessary. Check/renew the mirror motor/assembly.
B1C153A	Passenger Up/Down Mirror Motor Feedback Circuit	● Door mirror motor moved beyond expected range - Sensor circuit open or short circuit - Door mirror motor position sensor fault	Refer to the electrical guides and check the harness and connections between the seat memory module and the mirror. Repair/renew as necessary. Check/renew the mirror motor/assembly.
B1C163A	Passenger Left/Right Mirror Motor Feedback Circuit	● Door mirror motor moved beyond expected range - Sensor circuit open or short circuit - Door mirror motor position sensor fault	Refer to the electrical guides and check the harness and connections between the seat memory module and the mirror. Repair/renew as necessary. Check/renew the mirror motor/assembly.
B1C1773	Driver Mirror Left Switch	● Mirror left switch stuck ● Mirror left switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the mirror switch pack for short to ground. Check the switch operation, renew as necessary.
B1C1873	Driver Mirror Right Switch	● Mirror right switch stuck ● Mirror right switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the mirror switch pack for short to ground. Check the switch operation, renew as necessary.
B1C1973	Driver Mirror Up Switch	● Mirror up switch stuck ● Mirror up switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the mirror switch pack for short to ground. Check the switch operation, renew as necessary.
B1C2073	Driver Mirror Down Switch	● Mirror down switch stuck ● Mirror down switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the mirror switch pack for short to ground. Check the switch operation, renew as necessary.
B1C2173	Passenger Mirror Left Switch	● Mirror left switch stuck ● Mirror left switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the mirror switch pack for short to ground. Check the switch operation, renew as necessary.
B1C2273	Passenger Mirror Right Switch	● Mirror right switch stuck ● Mirror right switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the mirror switch pack for short to ground. Check the switch operation, renew as necessary.

DTC	Description	Possible cause	Action
B1C2373	Passenger Mirror Up Switch	- Mirror up switch stuck - Mirror up switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the mirror switch pack for short to ground. Check the switch operation, renew as necessary.
B1C2473	Passenger Mirror Down Switch	- Mirror down switch stuck - Mirror down switch circuit short to ground	Refer to the electrical guides and check the wiring between the memory control module and the mirror switch pack for short to ground. Check the switch operation, renew as necessary.
B1C2593	Pedal Motor Relay	- Software error (electric column/pedals not installed) - Memory control module internal relay fault (stuck on)	Where an electric column/pedal adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column/pedal adjustment is installed, check/renew the control module as necessary.
B1C2573	Pedal Motor Relay	- Software error (electric column/pedals not installed) - Memory control module internal relay fault (inoperative)	Where an electric column/pedal adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column/pedal adjustment is installed, check/renew the control module as necessary.
B1C263A	Pedal Motor Feedback Circuit	- Software error - Door mirror motor moved beyond expected range - Sensor circuit open or short circuit - Door mirror motor position sensor fault	Where an electric column/pedal adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column/pedal adjustment is installed, refer to the electrical guides and check the harness and connections between the seat memory module and the pedal height motor. Repair/renew as necessary. If no circuit fault is found check/renew the pedal height motor.
B1C2773	Pedal In Switch	- Software error (electric column/pedals not installed) - Pedal switch fault (stuck closed)	Where an electric column/pedal adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column/pedal adjustment is installed, refer to the electrical guides and check the pedal out switch circuit for short or open circuit and check/renew the pedal in switch as necessary.
B1C2873	Pedal Out Switch	- Software error (electric column/pedals not installed) - Pedal switch fault (stuck closed)	Where an electric column/pedal adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column/pedal adjustment is installed, refer to the electrical guides and check the pedal out switch circuit for short or open circuit and check/renew the pedal out switch as necessary.
B1C3173	Steering Column Motor Relay	- Software error (electric column not installed) - Steering column motor relay fault (stuck on)	Where an electric column adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column adjustment is installed, refer to the electrical guides and check the column motor circuit for short or open circuit and check/renew the memory control module as necessary.
B1C3193	Steering Column Motor Relay	- Software error (electric column not installed) - Memory control module internal relay fault (inoperative)	Where an electric column adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column adjustment is installed, check/renew the control module as necessary.
B1C3213	Steering Column Tilt Solenoid	- Software error (electric column not installed) - Steering column motor tilt solenoid open load	Where an electric column adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column adjustment is installed, refer to the electrical guides and check the column tilt solenoid circuit for short or open circuit and check/renew the tilt solenoid as necessary.
B1C3296	Steering Column Tilt Solenoid	- Software error (electric column not installed) - Steering column motor tilt solenoid thermal overload	Where an electric column adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column adjustment is installed, refer to the electrical guides and check the column tilt solenoid circuit for short or open circuit. Check for other relevant DTCs and repair as necessary. Allow the solenoid to cool, clear the DTC and check the solenoid/tilt function operation. If the DTC persists renew the tilt solenoid as necessary.
B1C333A	Steering Column Tilt Feedback Signal	- Software error (electric column not installed) - Steering column tilt motor moved beyond expected range	Where an electric column adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column adjustment is installed, refer to the electrical guides and check the column tilt solenoid feedback circuit

DTC	Description	Possible cause	Action
		- Sensor circuit open or short circuit - Motor position sensor fault	for short or open circuit. Check the solenoid/tilt function operation and range of movement. Renew the tilt solenoid as necessary.
B1C3413	Steering Column Telescopic Solenoid	- Software error (electric column not installed) - Steering column motor telescopic solenoid open load	Where an electric column adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column adjustment is installed, refer to the electrical guides and check the column telescopic solenoid circuit for short or open circuit and check/renew the tilt solenoid as necessary.
B1C3496	Steering Column Telescopic Solenoid	- Software error (electric column not installed) - Steering column motor telescopic solenoid thermal overload	Where an electric column adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column adjustment is installed, refer to the electrical guides and check the column telescopic solenoid circuit for short or open circuit. Check for other relevant DTCs and repair as necessary. Allow the solenoid to cool, clear the DTC and check the solenoid/telescopic function operation. If the DTC persists renew the telescopic solenoid as necessary.
B1C353A	Steering Column Telescopic Feedback Signal	- Software error (electric column not installed) - Steering column telescopic motor moved beyond expected range - Sensor circuit open or short circuit - Motor position sensor fault	Where an electric column adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column adjustment is installed, refer to the electrical guides and check the column telescopic solenoid feedback circuit for short or open circuit. Check the solenoid/telescopic function operation and range of movement. Renew the telescopic solenoid as necessary.
B1C363A	Steering Column Tilt/Telescope Switch	- Software error (electric column not installed) - Steering column tilt/telescopic switch voltage beyond expected range - Sensor circuit open or short circuit - Switch fault	Where an electric column adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column adjustment is installed, refer to the electrical guides and check the column tilt/telescopic switch circuit for short or open circuit. Check the tilt/telescopic switch operation and renew the switch as necessary.
B1C3723	Master Lock Switch Stuck	- Master central lock switch signal circuit short circuit to ground - Master central lock switch stuck/jammed - Master central lock switch failure	Refer to the electrical guides and check the master switch lock circuit. Check the switch operation, renew as necessary.
B1C3823	Master Unlock Switch Stuck	- Master central unlock switch signal circuit short circuit to ground - Master central unlock switch stuck/jammed - Master central unlock switch failure	Refer to the electrical guides and check the master switch unlock circuit. Check the switch operation, renew as necessary.
B1C3923	Key Lock Switch Stuck	- Key lock switch stuck/jammed - Key lock switch circuit short to ground (where connected) - Key lock switch failure - Internal CJB fault	Refer to the electrical guides and ensure there are no wires connected to the SJB connector on the key lock switch circuit. Clear the DTC and retest. If the DTC returns, suspect an internal fault with the CJB. If no other DTCs are present, ignore this fault.
B1C4023	Key Unlock Switch Stuck	- Key unlock switch stuck/jammed - Key unlock switch failure - Key unlock switch circuit short to ground (where connected) - Internal CJB fault	Refer to the electrical guides and ensure there are no wires connected to the SJB connector on the key unlock switch circuit. Clear the DTC and retest. If the DTC returns, suspect an internal fault with the CJB. If no other DTCs are present, ignore this fault.
B1C4123	Tailgate Release Switch #1	- Tailgate SW1 (Switch-tail door open) release circuit short to ground - Tailgate release switch stuck/jammed	Refer to the electrical guides and check the tailgate SW1 unlock circuit. Check the switch operation, renew as necessary.

DTC	Description	Possible cause	Action
		● Tailgate release switch failure	
B1C4223	Tailgate Release Switch #2	● Tailgate glass release switch (SW2- number plate lamp and tail door switch) signal circuit short circuit to ground ● Tailgate glass release switch stuck/jammed ● Tailgate glass release switch failure	Refer to the electrical guides and check the tailgate SW2 unlock circuit. Check the switch operation, renew as necessary.
B1C4323	Master Interior Lamp Switch Stuck	● Interior lamp circuit short to ground ● Interior lamp switch fault	Refer to the electrical guides and check the interior lamp circuit. Check the switch operation, renew as necessary.
B1C4467	Rear Wiper Park Position Switch Stuck	● Incorrect software level (NNV502520) resulting in DTC log when engine is cranked or the tailgate is opened when the rear wiper is running ● Rear wiper park position circuit short to ground ● Rear wiper motor park switch fault	Ensure the software level is NNV502990 or later and update if necessary using the manufacturers recommended diagnostic equipment. Clear the DTC and retest. Refer to the electrical guides and check the rear wiper park position circuit. Clear the DTC and retest. If the DTC returns, suspect an internal fault with the rear wiper motor, check and renew as required.
B1C4567	Front Wiper Park Position Switch Stuck	● Incorrect software level (NNV502520)resulting in DTC log when engine is cranked or the tailgate is opened when the front wiper is running ● Front wiper park position circuit short to ground ● Front wiper motor park switch fault	Ensure the software level is NNV502990 or later and update if necessary using the manufacturers recommended diagnostic equipment. Clear the DTC and retest. Refer to the electrical guides and check the front wiper park position circuit. Clear the DTC and retest. If the DTC returns, suspect an internal fault with the front wiper motor, check and renew as required.
B1C4623	Rear Washer Switch Stuck	● Rear washer circuit short to ground ● Rear washer switch fault	Refer to the electrical guides and check the rear washer switch circuit. Check the switch operation, renew as necessary.
B1C4723	Front Washer Switch Stuck	● Front washer circuit short to ground ● Front washer switch fault	Refer to the electrical guides and check the front washer switch circuit. Check the switch operation, renew as necessary.
B1C4823	Flash To Pass Switch Stuck	● Flash to pass circuit short to ground ● Flash to pass switch fault	Refer to the electrical guides and check the flash to pass switch circuit. Check the switch operation, renew as necessary.
B1C5024	Ignition Switch Crank Position Stuck	● Ignition switch crank position short circuit ● Ignition switch fault	Refer to the electrical guides and check the ignition switch circuit. Check the switch operation, renew as necessary.
B1C5329	Front Wiper Intermittent Data	● Front wiper intermittent circuit short or open circuit ● Front wiper switch fault	Refer to the electrical guides and check the intermittent wiper switch circuit. Check the switch operation, renew as necessary.
B1C5512	Horn Relay	● Horn relay coil circuit short to power	Refer to the electrical guides and check the horn relay circuit, repair as necessary.
B1C5514	Horn Relay	● Horn relay coil circuit short to ground or open circuit	Refer to the electrical guides and check the horn relay circuit, repair as necessary.
B1C5612	Horn Relay Output Circuit	● Horn relay output circuit short to power	Refer to the electrical guides and check the horn relay, repair/renew as necessary.
B1C5614	Horn Relay Output Circuit	● Horn relay output circuit short to ground or open circuit	Refer to the electrical guides and check the horn relay supply fuse and the horn relay circuit, repair as necessary.

DTC	Description	Possible cause	Action
B1C5712	Passive Start Ignition Relay Coil Circuit	- Passive start ignition relay coil circuit short to power	No action necessary, clear/ignore DTC.
B1C5714	Passive Start Ignition Relay Coil Circuit	- Passive start ignition relay output circuit short to ground or open circuit	No action necessary, clear/ignore DTC.
B1C5812	Power Windows Relay Coil Circuit	- Power windows relay coil circuit short to power	Refer to the electrical guides and check the power windows relay circuit, repair/renew as necessary.
B1C5814	Power Windows Relay Coil Circuit	- Power windows relay coil circuit short to ground or open circuit	Refer to the electrical guides and check the power windows relay circuit, repair as necessary.
B1C5912	Power Windows Relay Output Circuit	- Power windows relay output circuit short to power	Refer to the electrical guides and check the power windows relay output circuit, repair/renew as necessary.
B1C5914	Power Windows Relay Output Circuit	- Power windows relay output circuit short to ground or open circuit	Refer to the electrical guides and check the power windows relay supply fuse, output circuit fuse and relay output circuit, repair as necessary.
B1C6012	Sidelights Relay Output Circuit	- Side lamps relay output circuit short to power - Rear tail/brake lamp bulb incorrect spec - Rear tail/brake lamp bulb fault	A bulb fault can also cause DTC B1B0187 to be logged in the Body Control Module and DTC C1A5564 to be logged in the Park Brake Module. A fault in this circuit causing DTC B1C6012 to log could also cause up shift issues on automatic transmission vehicles. Check the rear tail/brake lamp bulbs for correct type, installation or faults including a short circuit of the bulb filaments. Refer to the electrical guides and check side lamps relay output circuit, repair/renew as necessary.
B1C6014	Sidelights Relay Output Circuit	- Side lamps relay output circuit short to ground or open circuit	Refer to the electrical guides and check the Side lamps relay supply fuse, output circuit fuse and relay output circuit, repair as necessary.
B1C6112	Battery Saver Relay Coil Circuit	- Battery saver relay coil circuit short to power	Refer to the electrical guides and check the battery saver relay circuit, repair/renew as necessary.
B1C6114	Battery Saver Relay Coil Circuit	- Battery saver relay coil circuit short to ground or open circuit	Refer to the electrical guides and check the power saver relay circuit, repair as necessary.
B1C6212	Battery Saver Relay Output Circuit	- Battery saver relay output circuit short to power	Refer to the electrical guides and check the battery saver relay circuit, repair/renew as necessary.
B1C6214	Battery Saver Relay Output Circuit	- Battery saver relay output circuit short to ground or open circuit	Refer to the electrical guides and check the battery saver relay supply fuse and relay output circuit, repair as necessary.
B1C6312	Driver Door Lock Relay Coil Circuit	- Driver door lock relay coil circuit short to power - Driver door lock relay failure	Refer to the electrical guides and check the driver door lock relay circuit, repair/renew as necessary.
B1C6314	Driver Door Lock Relay Coil Circuit	- Driver door lock relay coil circuit short to ground or open circuit - Driver door lock relay coil circuit high resistance - Driver door lock relay failure	Refer to the electrical guides and check the driver door lock relay circuit, repair as necessary.
B1C6412	Driver Door Lock Relay Output Circuit	- Driver door lock relay output circuit short to power - Driver door lock relay failure	Refer to the electrical guides and check the driver door lock relay circuit, repair/renew as necessary.
B1C6414	Driver Door Lock Relay Output Circuit	- Driver door lock relay output circuit short to ground or open circuit - Driver door lock relay output circuit high resistance - Driver door lock relay failure	Refer to the electrical guides and check the driver door lock relay output circuit, repair as necessary.

DTC	Description	Possible cause	Action
B1C6512	Lock Rest Relay Coil Circuit	● CDL lock relay coil circuit short to power ● Central door locking relay failure	Refer to the electrical guides and check the CDL lock relay circuit, repair/renew as necessary.
B1C6514	Lock Rest Relay Coil Circuit	● CDL lock rest relay coil circuit short to ground or open circuit ● Central door locking relay coil circuit high resistance ● Central door locking relay failure	Refer to the electrical guides and check the CDL lock relay circuit, repair as necessary.
B1C6612	Lock Rest Relay Output Circuit	● CDL lock rest relay output circuit short to power ● Central door locking relay failure	Refer to the electrical guides and check the CDL lock relay circuit, repair/renew as necessary.
B1C6614	Lock Rest Relay Output Circuit	● CDL lock rest relay output circuit short to ground or open circuit ● Central door locking relay output circuit high resistance ● Central door locking relay failure	Refer to the electrical guides and check the CDL lock relay output circuit, repair as necessary.
B1C6712	Driver Door Unlock Relay Coil Circuit	● Driver door unlock relay coil circuit short to power ● Driver door unlock relay failure	Refer to the electrical guides and check the driver door unlock relay circuit, repair/renew as necessary.
B1C6714	Driver Door Unlock Relay Coil Circuit	● Driver door unlock relay coil circuit short to ground or open circuit ● Driver door unlock relay coil circuit high resistance ● Driver door unlock relay failure	Refer to the electrical guides and check the driver door unlock relay circuit, repair as necessary.
B1C6812	Driver Door Unlock Relay Output Circuit	● Driver door unlock relay output circuit short to power ● Driver door unlock relay failure	Refer to the electrical guides and check the driver door unlock relay circuit, repair/renew as necessary.
B1C6814	Driver Door Unlock Relay Output Circuit	● Driver door unlock relay output circuit short to ground or open circuit ● Driver door unlock relay output circuit high resistance ● Driver door unlock relay failure	Refer to the electrical guides and check the driver door unlock rest relay output circuit, repair as necessary.
B1C6912	Passenger Door Unlock Relay Coil Circuit	● Passenger door unlock relay coil circuit short to power ● Central door unlock relay failure	Refer to the electrical guides and check the passenger door unlock relay circuit, repair/renew as necessary.
B1C6914	Passenger Door Unlock Relay Coil Circuit	● Central door unlock relay coil circuit short circuit to ground ● Central door unlock relay coil circuit high resistance ● Central door unlock relay failure	Refer to the electrical guides and check the passenger door unlock relay circuit, repair as necessary.
B1C7012	Passenger Door Unlock Relay Output Circuit	● Central door unlock relay output circuit short circuit to power ● Central door unlock relay failure	Refer to the electrical guides and check the passenger door unlock relay circuit, repair/renew as necessary.
B1C7014	Passenger Door Unlock Relay Output Circuit	● Central door unlock relay output circuit short circuit to ground ● Central door unlock relay output circuit high resistance ● Central door unlock relay failure	Refer to the electrical guides and check the passenger door unlock rest relay output circuit, repair as necessary.
B1C7312	Superlock Relay Coil Circuit	● Superlock relay coil circuit short circuit to power ● Superlock relay failure	Where installed, refer to the electrical guides and check the superlock relay circuit, repair/renew as necessary.

DTC	Description	Possible cause	Action
B1C7314	Superlock Relay Coil Circuit	● Superlock relay coil circuit short circuit to ground ● Superlock relay coil circuit high resistance ● Superlock relay failure	Where installed, refer to the electrical guides and check the superlock relay circuit, repair as necessary.
B1C7412	Superlock Relay Output Circuit	● Superlock relay output circuit short circuit to power ● Superlock relay failure	Where feature is installed, refer to the electrical guides and check the superlock relay circuit, repair/renew as necessary.
B1C7414	Superlock Relay Output Circuit	● Superlock relay output circuit short circuit to ground ● Superlock relay output circuit high resistance ● Superlock relay failure	Where feature is installed, refer to the electrical guides and check the superlock relay output circuit, repair as necessary.
B1C7612	Front Wiper Fast Relay Coil Circuit	● Front wiper fast relay coil circuit short to power	Refer to the electrical guides and check the front wiper fast relay circuit, repair/renew as necessary.
B1C7614	Front Wiper Fast Relay Coil Circuit	● Front wiper fast relay coil circuit short to ground or open circuit	Refer to the electrical guides and check the front wiper fast relay circuit, repair as necessary.
B1C7712	Rear Wiper Fast Relay Coil Circuit	● Rear wiper fast relay coil circuit short to power	Refer to the electrical guides and check the rear wiper fast relay circuit, repair/renew as necessary.
B1C7714	Rear Wiper Fast Relay Coil Circuit	● Rear wiper fast relay coil circuit short to ground or open circuit	Refer to the electrical guides and check the rear wiper fast relay circuit, repair as necessary.
B1C7812	Powerwash Relay Coil Circuit	● Front washer pump/powerwash relay coil circuit short to power	Refer to the electrical guides and check the relevant washer pump relay circuit, repair as necessary.
B1C7814	Powerwash Relay Coil Circuit	● Front washer pump/powerwash relay coil circuit short to ground or open circuit	Refer to the electrical guides and check the relevant washer pump relay circuit, repair as necessary.
B1C7912	Front Washer Pump Relay Output Circuit	● Front washer pump relay output circuit short to power	Refer to the electrical guides and check the front washer pump relay circuit, repair/renew as necessary.
B1C7914	Front Washer Pump Relay Output Circuit	● Front washer pump relay output circuit short to ground or open circuit	Refer to the electrical guides and check the front washer pump relay supply fuse and the relay output circuit, repair as necessary.
B1C8012	Rear Washer Pump Relay Coil Circuit	● Rear washer pump relay coil circuit short to power	Refer to the electrical guides and check the rear washer pump relay circuit, repair as necessary.
B1C8014	Rear Washer Pump Relay Coil Circuit	● Rear washer pump relay coil circuit short to ground or open circuit	Refer to the electrical guides and check the rear washer pump relay circuit, repair as necessary.
B1C8112	Rear Washer Pump Relay Output Circuit	● Rear washer pump relay output circuit short to power	Refer to the electrical guides and check the rear washer pump relay circuit, repair/renew as necessary.
B1C8114	Rear Washer Pump Relay Output Circuit	● Rear washer pump relay output circuit short to ground or open circuit	Refer to the electrical guides and check the rear washer pump relay supply fuse and the relay output circuit, repair as necessary.
B1C8212	Headlamp Washer Relay A	● Headlamp washer relay output circuit short to power	Where feature is installed, refer to the electrical guides and check the headlamp pump relay circuit, repair as necessary.
B1C8214	Headlamp Washer Relay A	● Headlamp washer relay output circuit short to power	Where feature is installed, refer to the electrical guides and check the headlamp pump relay circuit, repair/renew as necessary.
B1C8312	Heated Rear Window Relay Coil Circuit	● Heated rear window relay coil circuit short to power	Refer to the electrical guides and check the heated rear window relay circuit, repair as necessary.

DTC	Description	Possible cause	Action
B1C8314	Heated Rear Window Relay Coil Circuit	- Heated rear window relay coil circuit short to ground or open circuit	Refer to the electrical guides and check the heated rear window relay circuit, repair as necessary.
B1C8412	Heated Rear Window Relay Output Circuit	- Heated rear window relay output circuit short to power	Refer to the electrical guides and check the heated rear window relay circuit, repair/renew as necessary.
B1C8414	Heated Rear Window Relay Output Circuit	- Heated rear window relay output circuit short to ground or open circuit	Refer to the electrical guides and check the heated rear window relay supply fuse and the relay output circuit, repair as necessary.
B1C8512	Autolamps Switch Illumination Relay Coil Circuit	- Autolamps switch illumination relay coil circuit short to power	Where installed, refer to the electrical guides and check the autolamps switch illumination relay circuit, repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C8514	Autolamps Switch Illumination Relay Coil Circuit	- Autolamps switch illumination relay coil circuit short to ground or open circuit	Where installed, refer to the electrical guides and check the autolamps switch illumination relay circuit, repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C8612	Autolamps Switch Illumination Relay Output Circuit	- Autolamps switch illumination relay output circuit short to power	Where installed, refer to the electrical guides and check the autolamps switch illumination relay circuit, repair/renew as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C8614	Autolamps Switch Illumination Relay Output Circuit	- Autolamps switch illumination relay output circuit short to ground or open circuit	Where installed, refer to the electrical guides and check the autolamps switch illumination relay supply fuse and the relay output circuit, repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C8812	Reversing Lamps Relay Coil Circuit	- Reversing lamps relay coil circuit short to power	Refer to the electrical guides and check the reversing lamps relay circuit, repair as necessary.
B1C8814	Reversing Lamps Relay Coil Circuit	- Reversing lamps relay coil circuit short to ground or open circuit	Refer to the electrical guides and check the reversing lamps relay circuit, repair as necessary.
B1C8912	Auxiliary Driving Lamps Relay Output Circuit	- Auxiliary driving lamps relay output circuit short to power	Where installed, refer to the electrical guides and check the Auxiliary driving lamps relay circuit, repair/renew as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C8914	Auxiliary Driving Lamps Relay Output Circuit	- Auxiliary driving lamps relay output circuit short to ground or open circuit	Where installed, refer to the electrical guides and check the Auxiliary driving lamps relay output circuit, repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C9012	Auxiliary Driving Lamps Relay Coil Circuit	- Auxiliary driving lamps relay coil circuit short to power	Where installed, refer to the electrical guides and check the Auxiliary driving lamps relay circuit, repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C9014	Auxiliary Driving Lamps Relay Coil Circuit	- Auxiliary driving lamps relay coil circuit short to ground or open circuit	Where installed, refer to the electrical guides and check the Auxiliary driving lamps relay circuit, repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C9112	Fuel Flap Lock Relay Coil Circuit	- Fuel flap lock relay coil circuit short circuit to power - Fuel flap lock relay failure	Where installed, refer to the electrical guides and check the fuel flap/door lock relay circuit, repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C9114	Fuel Flap Lock Relay Coil Circuit	- Fuel flap lock relay coil circuit short circuit to ground - Fuel flap lock relay coil circuit high resistance - Fuel flap lock relay failure	Where installed, refer to the electrical guides and check the fuel flap/door lock relay circuit, repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C9212	Fuel Flap Lock Relay Output Circuit	- Fuel flap lock relay output circuit short circuit to power - Fuel flap lock relay failure	Where installed, refer to the electrical guides and check the fuel flap/door lock relay circuit, repair/renew as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.

DTC	Description	Possible cause	Action
B1C9214	Fuel Flap Lock Relay Output Circuit	● Fuel flap lock relay output circuit short circuit to ground ● Fuel flap lock relay output circuit high resistance ● Fuel flap lock relay failure	Where installed, refer to the electrical guides and check the fuel flap/door lock relay supply fuse and the relay output circuit, repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C9312	Fuel Flap Unlock Relay Coil Circuit	● Fuel flap unlock relay coil circuit short circuit to power ● Fuel flap unlock relay failure	Where installed, refer to the electrical guides and check the fuel flap/door unlock relay circuit, repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C9314	Fuel Flap Unlock Relay Coil Circuit	● Fuel flap unlock relay coil circuit short circuit to ground ● Fuel flap unlock relay coil circuit high resistance ● Fuel flap unlock relay failure	Where installed, refer to the electrical guides and check the fuel flap/door unlock relay circuit, repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C9412	Fuel Flap Unlock Relay Output Circuit	● Fuel flap unlock relay output circuit short circuit to power ● Fuel flap unlock relay failure	Where installed, refer to the electrical guides and check the fuel flap/door unlock relay circuit, repair/renew as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C9414	Fuel Flap Unlock Relay Output Circuit	● Fuel flap unlock relay output circuit short circuit to ground ● Fuel flap unlock relay output circuit high resistance ● Fuel flap unlock relay failure	Where installed, refer to the electrical guides and check the fuel flap/door unlock relay supply fuse and the relay output circuit, repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C9511	Approach Lamps Circuit	● Approach lamps circuit short to ground, overload or over-temperature	Where installed, refer to the electrical guides and check the approach lamps circuit and repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C9515	Approach Lamps Circuit	● Approach lamps circuit short circuit to power or open load	Where installed, refer to the electrical guides and check the approach lamps circuit and repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C9611	Alarm LED	● Alarm LED circuit short to ground or over-temperature	Where volumetric alarm feature is installed, refer to the electrical guides and check the alarm LED circuit, repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C9615	Alarm LED	● Alarm LED circuit short circuit to power or open load	Where volumetric alarm feature is installed, refer to the electrical guides and check the alarm LED circuit, repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C9811	Left Corner Lamp Circuit	● Left corner lamp circuit short to ground, overload or over-temperature	Where corner lamps are installed, refer to the electrical guides and check the left-hand circuit, repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C9815	Left Corner Lamp Circuit	● Left corner lamp circuit short circuit to power or open load	Where corner lamps are installed, refer to the electrical guides and check the left-hand circuit, repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C9911	Right Corner Lamp Circuit	● Right corner lamp circuit short to ground, overload or over-temperature	Where corner lamps are installed, refer to the electrical guides and check the right-hand circuit, repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1C9915	Right Corner Lamp Circuit	● Right corner lamp circuit short circuit to power or open load	Where corner lamps are installed, refer to the electrical guides and check the right-hand circuit, repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1D0011	Left Low Beam	● Left low beam lamp circuit short to ground, overload or over-temperature	Refer to the electrical guides and check the left-hand circuit, repair as necessary.
B1D0015	Left Low Beam	● Left low beam lamp circuit short circuit to power or open load	Refer to the electrical guides and check the left-hand circuit, repair as necessary.

DTC	Description	Possible cause	Action
B1D0111	Right Low Beam	- Right low beam lamp circuit short to ground, overload or over-temperature	Refer to the electrical guides and check the right-hand circuit, repair as necessary.
B1D0115	Right Low Beam	- Right low beam lamp circuit short circuit to power or open load	Refer to the electrical guides and check the right-hand circuit, repair as necessary.
B1D0211	Left High Beam Circuit	- Left high beam lamp circuit short to ground, overload or over-temperature	Refer to the electrical guides and check the left-hand circuit, repair as necessary.
B1D0215	Left High Beam Circuit	- Left high beam lamp circuit short circuit to power or open load	Refer to the electrical guides and check the left-hand circuit, repair as necessary.
B1D0311	Right High Beam Circuit	- Right high beam lamp circuit short to ground, overload or over-temperature	Refer to the electrical guides and check the right-hand circuit, repair as necessary.
B1D0315	Right High Beam Circuit	- Right high beam lamp circuit short circuit to power or open load	Refer to the electrical guides and check the right-hand circuit, repair as necessary.
B1D0414	Upper Tailgate Release Circuit	- Tailgate glass release actuator operated more than 10 times within 1 minute - Tailgate glass release actuator circuit high resistance - Tailgate glass release actuator failure	Refer to the electrical guides and check the tailgate release circuit, repair as necessary.
B1D0511	Lower Tailgate Release Circuit	- Tailgate release actuator operated more than 10 times within 1 minute - Tailgate release actuator circuit short circuit to ground - Tailgate release actuator failure	Refer to the electrical guides and check the tailgate circuit, repair as necessary.
B1D0515	Lower Tailgate Release Circuit	- Tailgate release actuator circuit short circuit to power - Tailgate release actuator circuit high resistance - Tailgate release actuator failure	If no customer complaint issue exists with tailgate operation, no action necessary, clear/ignore DTC. If tailgate functionality is incorrect, refer to the electrical guides and check the tailgate circuit, repair as necessary.
B1D0611	Left Turn Indicator	- Left turn indicator lamp circuit short to ground, overload or over-temperature	Refer to the electrical guides and check the left-hand circuit, repair as necessary.
B1D0615	Left Turn Indicator	- Left turn indicator lamp circuit short circuit to power or open load	Refer to the electrical guides and check the left-hand circuit, repair as necessary.
B1D0711	Right Turn Indicator	- Right turn indicator lamp circuit short to ground, overload or over-temperature	Refer to the electrical guides and check the right-hand circuit, repair as necessary.
B1D0715	Right Turn Indicator	- Right turn indicator lamp circuit short circuit to power or open load	Refer to the electrical guides and check the right-hand circuit, repair as necessary.
B1D0811	Left-Hand Trailer Indicator Circuit	- Left-hand trailer indicator lamp circuit short to ground, overload or over-temperature	Refer to the electrical guides and check the left-hand circuit, repair as necessary.
B1D0815	Left-Hand Trailer Indicator Circuit	- Left-hand trailer indicator lamp circuit short circuit to power or open load	Refer to the electrical guides and check the left-hand circuit, repair as necessary.

DTC	Description	Possible cause	Action
B1D0911	Right-Hand Trailer Indicator Circuit	- Right-hand trailer indicator lamp circuit short to ground, overload or over-temperature	Refer to the electrical guides and check the right-hand circuit, repair as necessary.
B1D0915	Right-Hand Trailer Indicator Circuit	- Right-hand trailer indicator lamp circuit short circuit to power or open load	Refer to the electrical guides and check the right-hand circuit, repair as necessary.
B1D1011	Air Suspension Control Circuit	- Air suspension control circuit short to ground, overload or over-temperature	Refer to the electrical guides and check the circuit, repair as necessary.
B1D1015	Air Suspension Control Circuit	- Air suspension control circuit short circuit to power or open load	Refer to the electrical guides and check the circuit, repair as necessary.
B1D1211	Volumetric Alarm Power Circuit	- Volumetric alarm power circuit short to ground, overload or over-temperature	Refer to the electrical guides and check the circuit, repair as necessary.
B1D1215	Volumetric Alarm Power Circuit	- Volumetric alarm power circuit short circuit to power or open load	Where volumetric alarm feature is installed, refer to the electrical guides and check the circuit, repair as necessary. Where the feature is not installed, check the vehicle configuration and clear/ignore this DTC.
B1D1311	Interior lamps circuit A	- Interior lamps circuit A short to ground, overload or over-temperature	Refer to the electrical guides and check the circuit, repair as necessary.
B1D1315	Interior Lamps Circuit A	- Software error - Interior lamps circuit A short circuit to power or open load	If no customer complaint issue exists with interior lamp operation, no action necessary, clear/ignore DTC. If interior lamp functionality is incorrect, refer to the electrical guides and check the circuit, repair as necessary.
B1D1411	Interior Lamps Circuit B	- Interior lamps circuit B short to ground, overload or over-temperature	Refer to the electrical guides and check the circuit, repair as necessary.
B1D1415	Interior Lamps Circuit B	- Software error - Interior lamps circuit B short circuit to power or open load	If no customer complaint issue exists with interior lamp operation, no action necessary, clear/ignore DTC. If interior lamp functionality is incorrect, refer to the electrical guides and check the circuit, repair as necessary.
B1D1512	Global Open/Close Circuit	- Global open/close circuit short to power	Refer to the electrical guides and check the circuit, repair as necessary.
B1D1749	Battery Backed Sounder (BBUS)	- BBUS siren communication fault	BBUS is not installed to all variants (optional). Fault logging is inhibited by the CCF, but incorrect CCF configuration could give erroneous DTC logging. Repair action only required for vehicles installed with BBUS.
B1D1787	Battery Backed Sounder (BBUS)	- Lost communication with BBUS	BBUS is not installed to all variants (optional). Fault logging is inhibited by the CCF, but incorrect CCF configuration could give erroneous DTC logging. Repair action only required for vehicles installed with BBUS.
B1D1887	Volumetric Sensor	- Volumetric Sensor failed to respond: - Response pulse not received correctly	The volumetric sensor is not installed to all variants (optional). Fault logging is inhibited by the CCF, but incorrect CCF configuration could give erroneous DTC logging. Repair action only required for vehicles installed with volumetric sensor.
B1D3523	Hazard Switch Stuck	- Hazard switch circuit short to ground - Hazard switch fault	Check the hazard switch operation, refer to the electrical guides and check the hazard switch circuit. Repair/renew as necessary.
B1D3613	Turn Indicator Switch	- Indicator switch connection open circuit	Refer to the electrical guides and check the switch circuit, repair/renew as necessary.
B1D3713	Wiper Switch Connection Circuit	- Wiper switch connection circuit open circuit	Refer to the electrical guides and check the switch circuit, repair/renew as necessary.

DTC	Description	Possible cause	Action
B1D3813	Front Wiper Motor	● Front wiper motor circuit open circuit	Refer to the electrical guides and check the wiper circuit, repair/renew as necessary.
B1D3913	Rear Wiper Motor	● Rear wiper motor circuit open circuit	Refer to the electrical guides and check the wiper circuit, repair/renew as necessary.
B1D4013	Lighting Switch Connection Circuit	● Lighting switch connection circuit open circuit	Refer to the electrical guides and check the switch circuit, repair/renew as necessary.
B1D4113	Bonnet Switch Connection Circuit	● Hood ajar switch circuit high resistance ● Hood ajar switch failure	Refer to the electrical guides and check the switch circuit, repair/renew as necessary.
B1D4213	Driver Door Latch Connection Circuit	● Driver door ajar switch circuit high resistance ● Driver door ajar switch failure	Refer to the electrical guides and check the latch circuit, repair/renew as necessary.
B1D4313	Passenger Door Latch Connection Circuit	● Front passenger door ajar switch circuit high resistance ● Front passenger door ajar switch failure	Refer to the electrical guides and check the latch circuit, repair/renew as necessary.
B1D4413	Rear Left Door Latch Connection Circuit	● Left-hand rear door ajar switch circuit high resistance ● Left-hand rear door ajar switch failure	Refer to the electrical guides and check the latch circuit, repair/renew as necessary.
B1D4513	Rear Right Door Latch Connection Circuit	● Right-hand rear door ajar switch circuit high resistance ● Right-hand rear door ajar switch failure	Refer to the electrical guides and check the latch circuit, repair/renew as necessary.
B1D4613	Tailgate Latch Connection Circuit	● Tailgate ajar switch circuit high resistance ● Tailgate ajar switch failure	Refer to the electrical guides and check the latch circuit, repair/renew as necessary.
B1D9749	Tilt Sensor	● Lost communication with tilt sensor	BBUS (including the tilt sensor) is not installed to all variants (optional). Fault logging is inhibited by the CCF, but incorrect CCF configuration could give erroneous DTC logging. Repair action only required for vehicles installed with BBUS that are exhibiting incorrect tilt sensor behaviour.
U007388	Control Module Communication BUS A Off	● Bus off. The CJB has detected the data bus is not available ● CAN bus open circuit ● CAN bus short circuit to ground ● CAN bus short circuit to power ● CJB module, connector damage, cavity pin damage	Refer to the electrical guides, check CAN circuit for open circuit, short to ground, short to power, repair/renew as necessary. Check the CJB for damage to the connector cavity pins, replace CJB as necessary.
U015587	Lost Communication With The IPK	● Missing message. The CJB has not received one or more expected messages from the instrument cluster ● Open circuit instrument cluster, powerfeed ● Open circuit instrument cluster, ground supply	Using the manufacturer approved diagnostic system, check instrument cluster for DTCs and refer to the relevant DTC Index. Using the manufacturer approved diagnostic system, carry out network integrity test. Refer to the electrical guides, check power feeds and ground supplies, to instrument cluster for open circuit. Check CAN harness to instrument cluster, repair as necessary.
U016487	Lost Communication With The ATC Module	● Missing message. The CJB has not received one or more expected messages from the auxiliary heater control module ● Open circuit auxiliary heater control module, powerfeed ● Open circuit auxiliary heater control module, ground supply	Using the manufacturer approved diagnostic system, check auxiliary heater control module for DTCs and refer to the relevant DTC Index. Using the manufacturer approved diagnostic system, carry out network integrity test. Refer to the electrical guides, check power feeds and ground supplies, to auxiliary heater control module for open circuit. Check CAN harness to auxiliary heater control module, repair as necessary.

DTC	Description	Possible cause	Action
U030055	Internal Control Module Software Incompatibility	● Not configured. The CJB module has failed to recognise the correct master configuration ID from the CAN data bus master, the instrument cluster ● CJB not correctly configured ● Instrument cluster not correctly configured	Using the manufacturer approved diagnostic system, check the vehicle configuration file, rectify as necessary. Check correct software version is installed to both CJB and instrument cluster, update as necessary.
U1A0387	Car Config Parameter	● Missing message. The CJB has not received one or more expected messages from the instrument cluster ● The CAN message that contains the car configuration parameters is not received by the CJB	Using the manufacturer approved diagnostic system, check the vehicle configuration file, rectify as necessary. Check correct software version is installed to both CJB and instrument cluster, update as necessary.
U1A1449	CAN Initialization Failure	● Internal electronic failure. The CJB has indicated the detection of an internal circuit failure ● The CAN controller initialisation has failed ● CJB internal failure	Using the manufacturer approved diagnostic system, check correct software version is installed to CJB. Suspect the CJB, check and install a new CJB as required, refer to the new module/component installation note at the top of the DTC Index.
U200168	Reduced System Function	● Event information. System event not caused by the CJB, but requiring the CJB to record this DTC. ● The CJB has measured a voltage greater than 16.8 volts for a time > than 30 seconds ● The CJB has measured a voltage less than 8.6 volts for a time > than 30 seconds ● Another feature of the vehicle is not working as expected ● Vehicle charging system failure ● Vehicle battery failure	Using the manufacturer approved diagnostic system, check the rest of the vehicle modules for DTC's. Check if the customer has complained of something not working as expected. Refer to the relevant section of the workshop manual and check vehicle charging system and battery.

Module Communications Network - Battery Junction Box (BJB)V8 S/C 4.2L Petrol

Removal and Installation

Removal

• NOTE: The BJB is an integral component of the engine compartment wiring harness and cannot be removed separately.

1. Disconnect the battery ground cable.
For additional information, refer to: Battery Disconnect (414-01, General Procedures).

2. Make the SRS system safe.
For additional information, refer to: Standard Workshop Practices (100-00 General Information, Description and Operation).

3. Remove the engine cover.
For additional information, refer to: Engine Cover - V8 S/C 4.2L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).

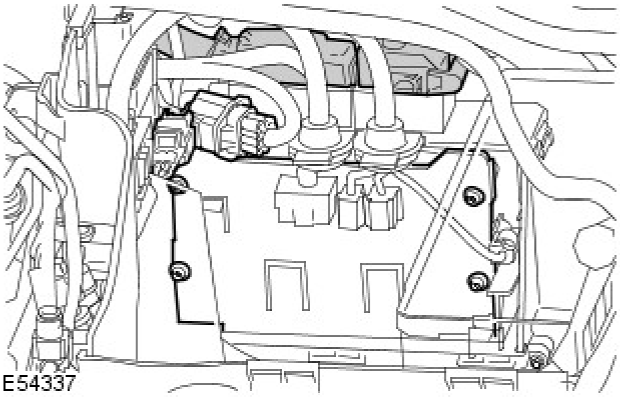
4. Remove the radiator grille.
For additional information, refer to: Radiator Grille (501-08 Exterior Trim and Ornamentation, Removal and Installation).

5. Remove the air cleaner assembly.
For additional information, refer to: Air Cleaner (303-12A Intake Air Distribution and Filtering - V8 S/C 4.2L Petrol, Removal and Installation).

6. Remove the four-wheel drive control module.
For additional information, refer to: Four-Wheel Drive (4WD) Control Module (308-07A Four-Wheel Drive Systems, Removal and Installation).

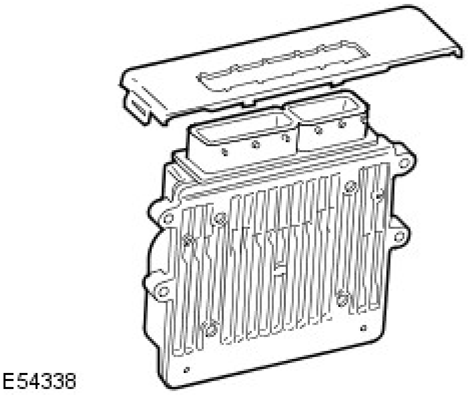
7. Remove the battery tray.
For additional information, refer to: Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).

8. Remove the auxiliary battery tray.
For additional information, refer to: Auxiliary Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).



9. Remove the ECM cover.

- Disconnect 2 electrical connectors for access.
- Disconnect the 2 ECM electrical connectors.
- Remove the 4 Torx screws.



10. Remove the ECM.

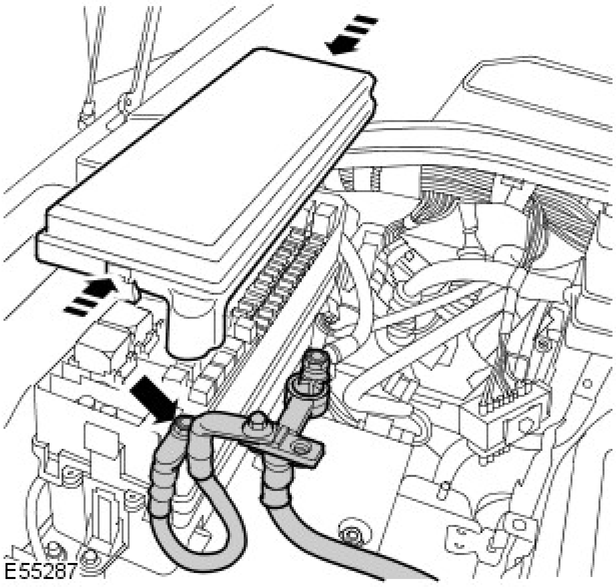
- Remove the ECM top cover.

11. Remove the BJB cover.

- Release the clip.

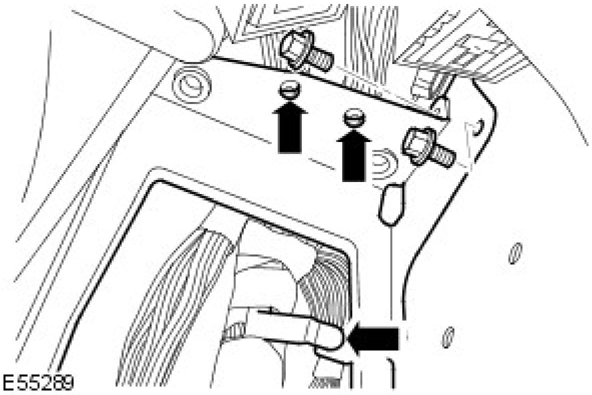
12. Disconnect the battery positive cable from the BJB.

- Remove the nut.



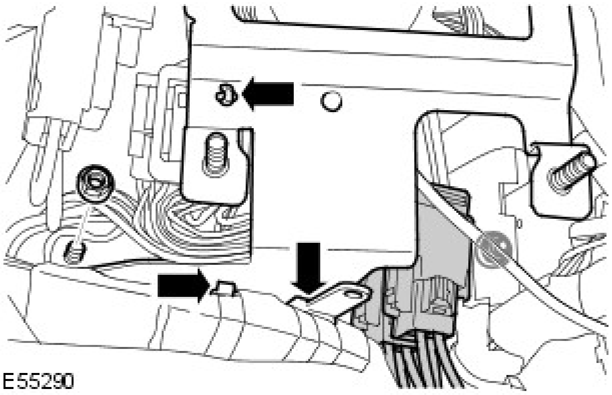
13. Remove both cowl side trim panels.
For additional information, refer to: Cowl Side Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

14. Remove the CJB.
For additional information, refer to: Central Junction Box (CJB) (418-00 Module Communications Network, Removal and Installation).



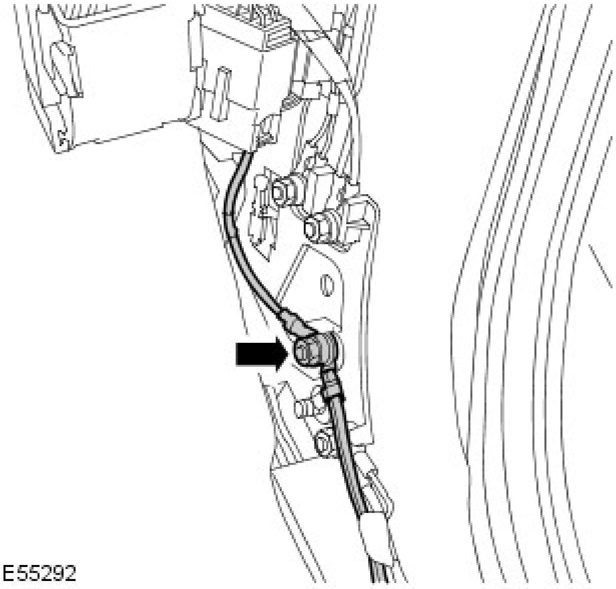
15. Release the CJB bracket.

- Release the 3 upper wiring harness clips.
- Remove the 2 bolts.



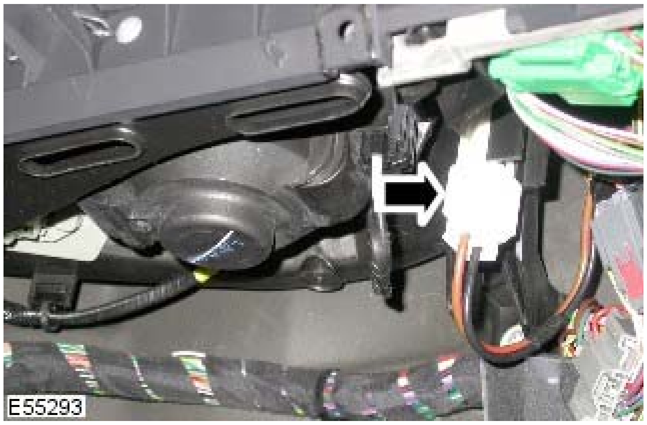
16. Remove the CJB bracket.

- Disconnect the 2 electrical connectors.
- Release the 3 lower wiring harness clips.
- Remove the 2 nuts.

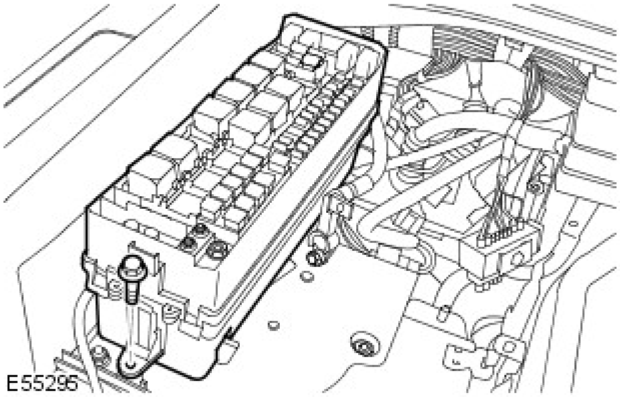


17. Release the 2 ground cables from the lower A-pillar.

- Remove the nut.

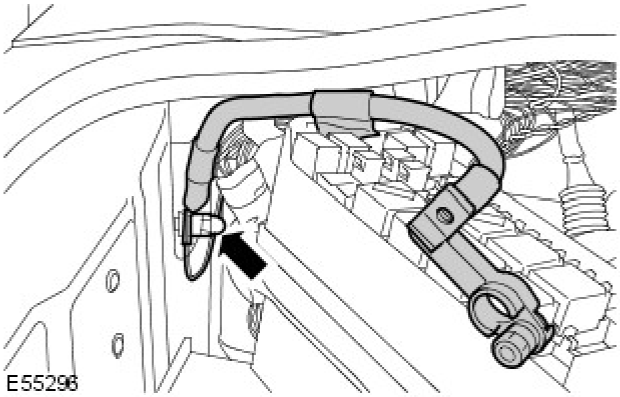


18. Disconnect the heater motor electrical connector.



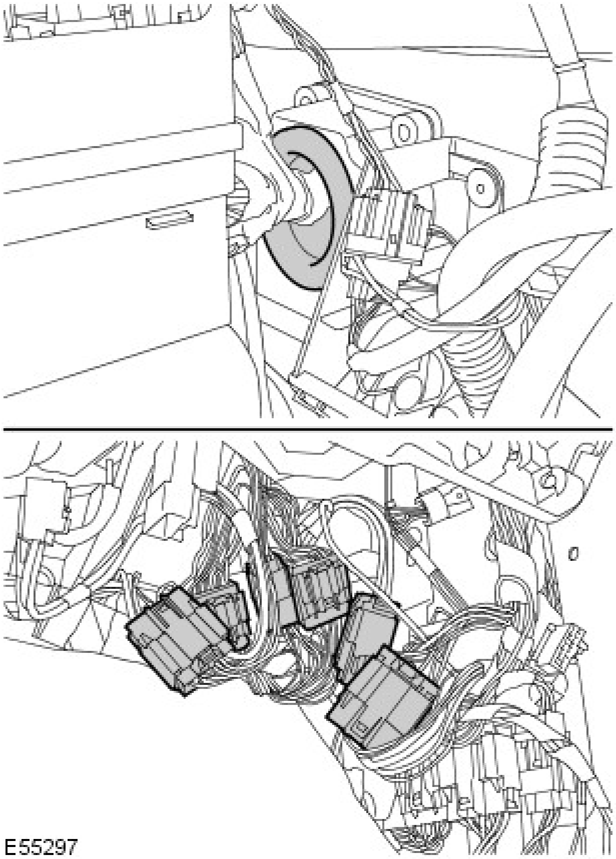
19. Release the BJB from the bracket.

- Remove the bolt.



20. Remove the battery ground cable.

- Remove the nut.
- Release the additional ground cable.



E55297

21. Release the BJB wiring harness from the bulkhead.

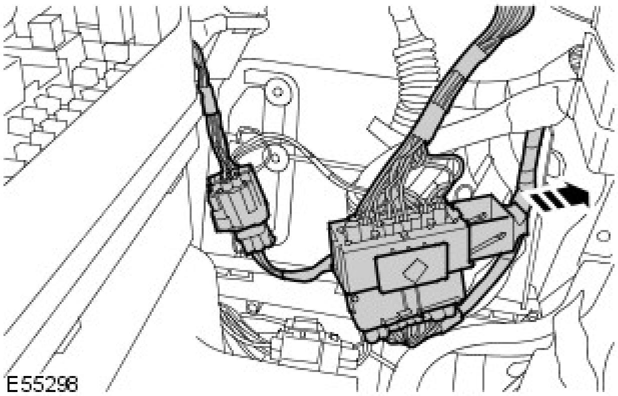
- Disconnect the 6 electrical connectors.
- Release the grommet.

22. Raise and support the vehicle.

23. Remove both front fender splash shields.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

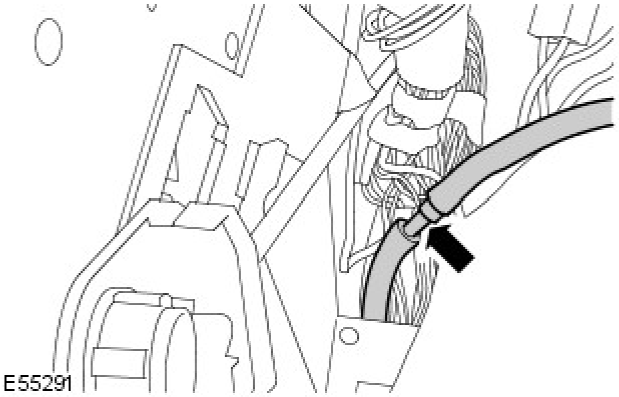
24. Remove both headlamps.
For additional information, refer to: Headlamp Assembly (417-01 Exterior Lighting, Removal and Installation).

25. Passenger side: Disconnect the engine wiring harness electrical connector.

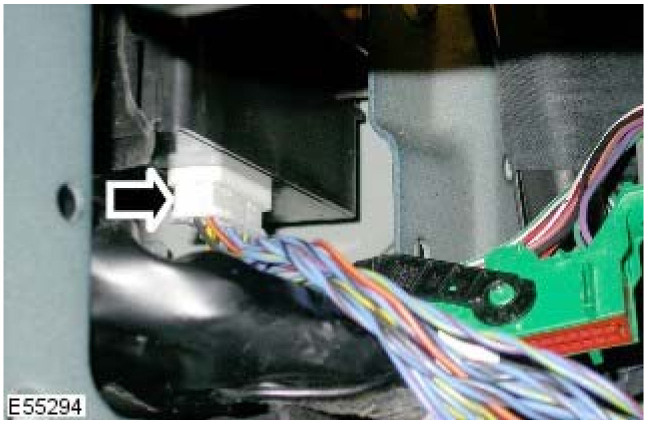


E55298

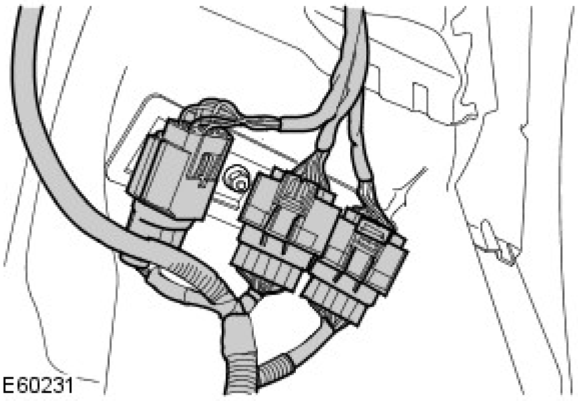
26. Passenger side: Disconnect the transfer case electrical connector.



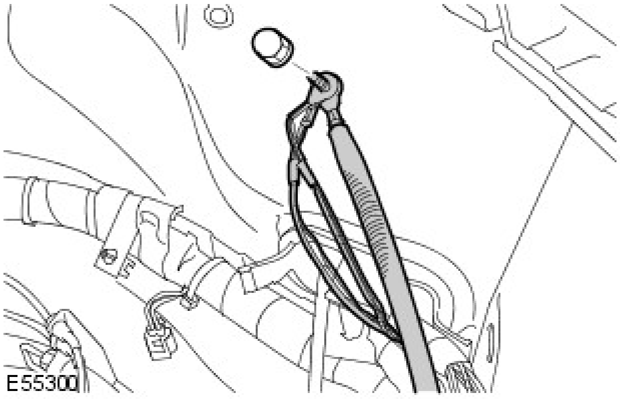
27. LH side: Disconnect the washer jet hose.



28. LH side: Disconnect the adaptive front lighting module electrical connector.



29. LH side: Disconnect the 3 body panel electrical connectors.



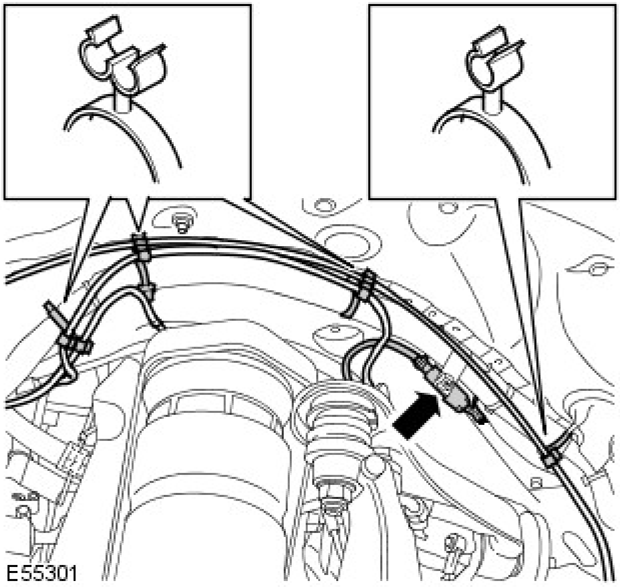
30. LH side: Release the 3 body panel ground cables.

- Remove the nut.

31. LH side: Release the 2 air suspension pipes from the wiring harness.

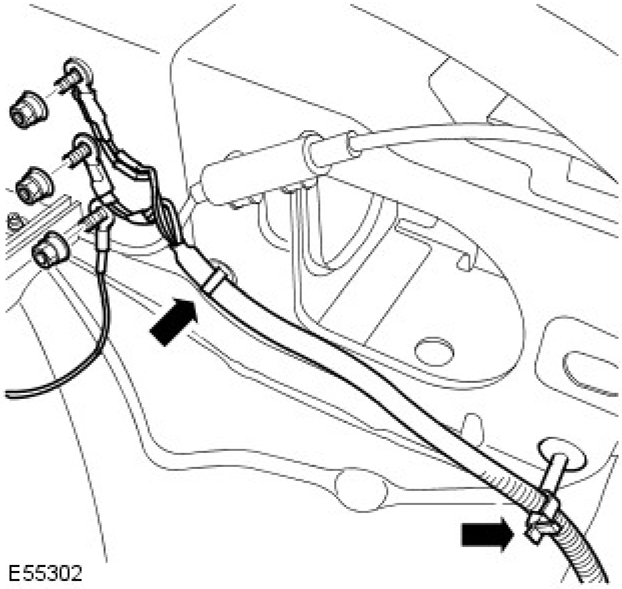
- Release the 7 clips.

32. LH side: Disconnect the ABS electrical connector.



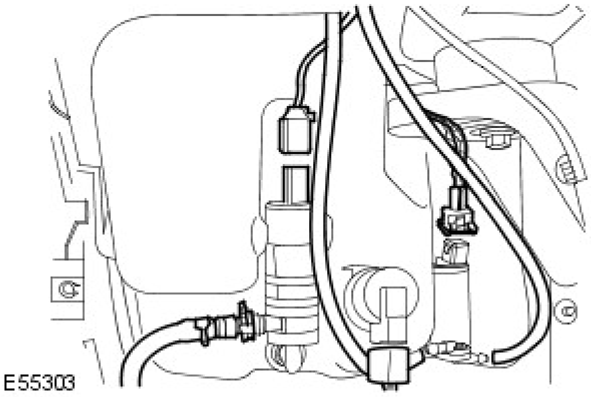
33. LH side: Release 3 engine compartment ground cables.

- Remove the 3 nuts.
- Release the 2 clips.

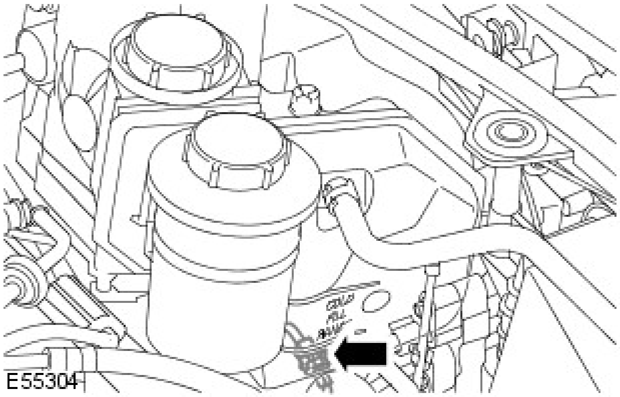


34. LH side: Release the washer reservoir wiring harness.

- Disconnect the 3 electrical connectors.
- Disconnect the 2 washer jet hoses.



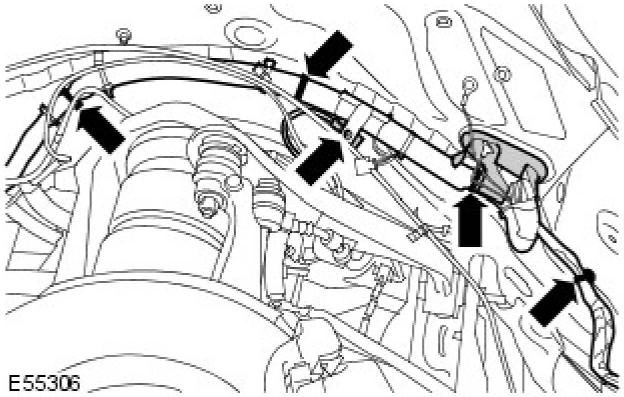
35. LH side: Disconnect the coolant expansion tank level switch electrical connector.



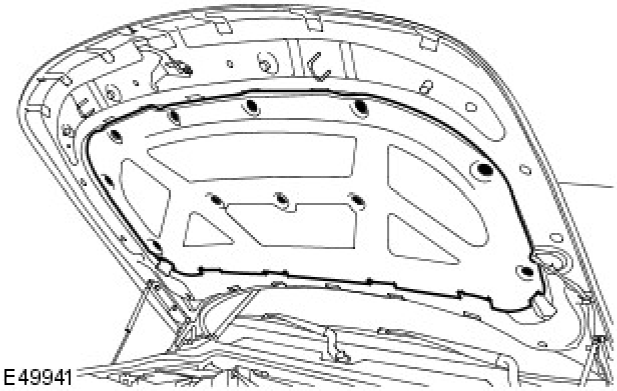
36. LH side: Disconnect the brake pad wear sensor electrical connector.

37. LH side: Release the wiring harness.

- Release the grommet.
- Release the 4 clips.

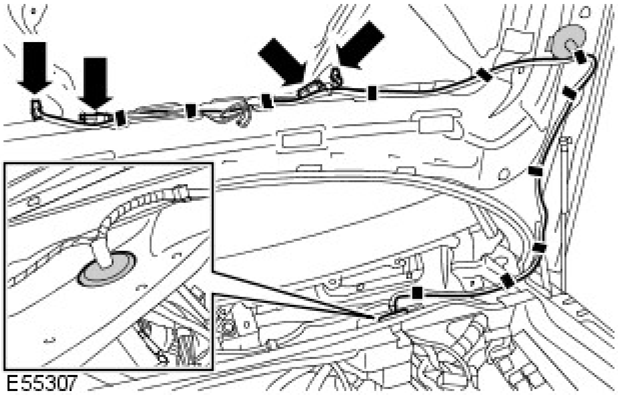


38. Remove the windshield wiper motor.
For additional information, refer to: Windshield Wiper Motor (501-16 Wipers and Washers, Removal and Installation).



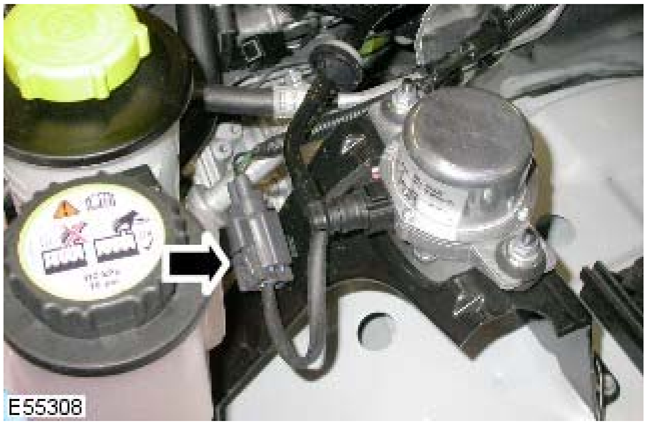
39. Remove the hood pad.

- Remove the 11 clips.

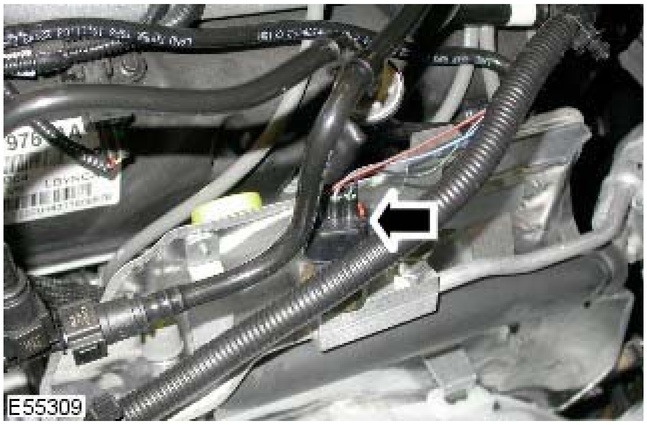


40. Release the hood wiring harness.

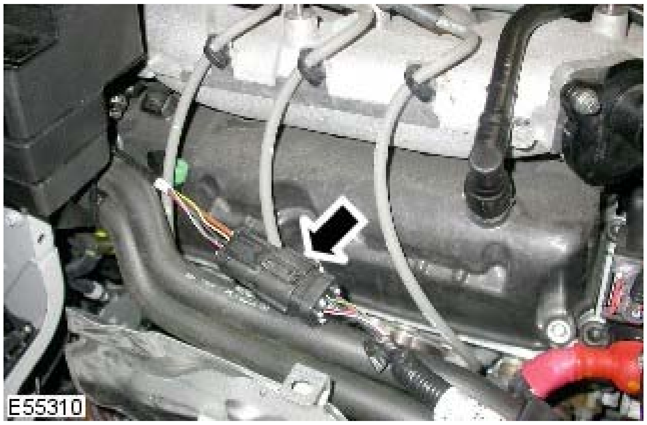
- Disconnect the 2 washer jet hoses.
- Disconnect the 2 electrical connectors.
- Release the 10 clips.
- Remove the wiring harness cover.
- Release the grommet.



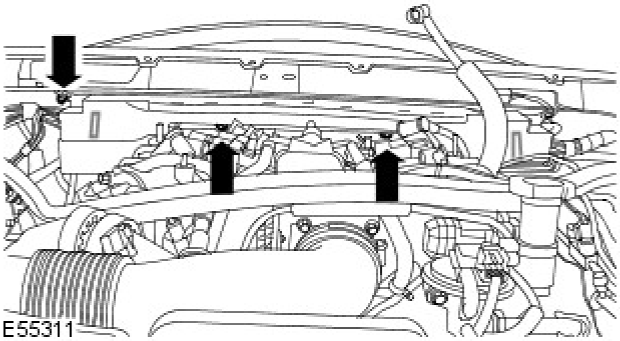
41. Disconnect the brake booster vacuum pump electrical connector.



42. Disconnect the A/C pressure transducer electrical connector.

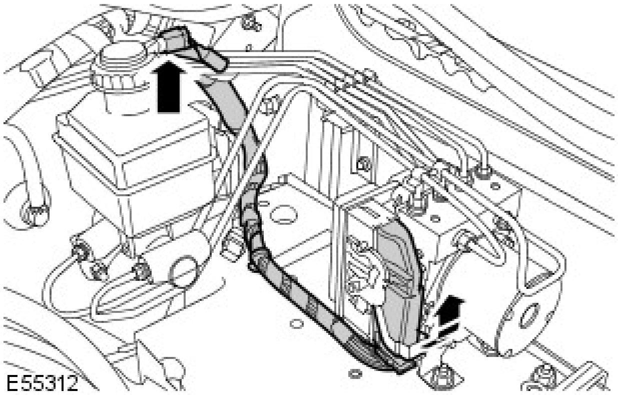


43. Disconnect the battery to engine compartment wiring harness electrical connector.



44. Release the wiring harness from the plenum.

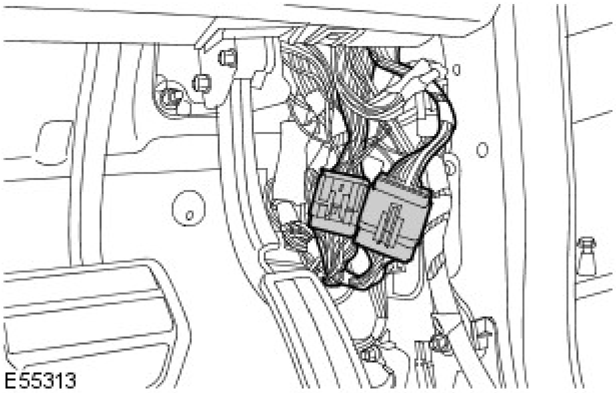
- Release the 2 clips.
- Remove the 3 nuts.



45. Disconnect the brake fluid reservoir electrical connector.

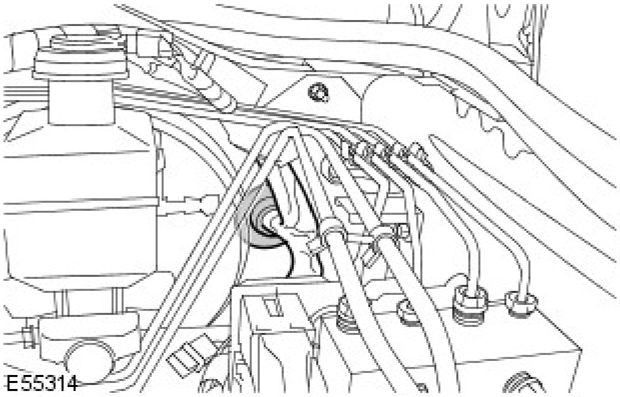
46. Disconnect the ABS module electrical connector.

47. Remove the air suspension control module.
For additional information, refer to: Air Suspension Control Module (204-05 Vehicle Dynamic Suspension, Removal and Installation).



E55313

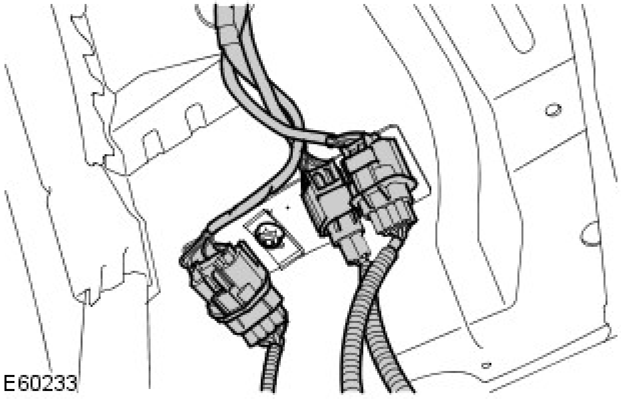
48. Driver side: Disconnect 2 electrical connectors from the lower A-pillar.



E55314

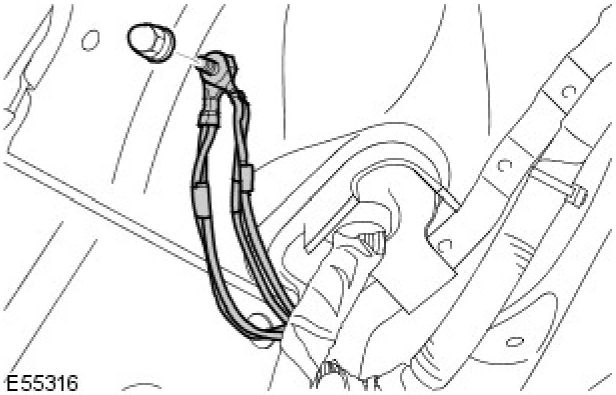
49. Driver side: Release the wiring harness from the bulkhead.

- Release the grommet.



E60233

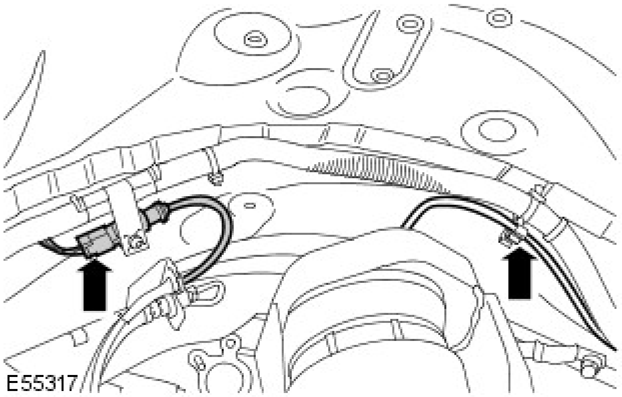
50. RH side: Disconnect the 3 body panel electrical connectors.



E55316

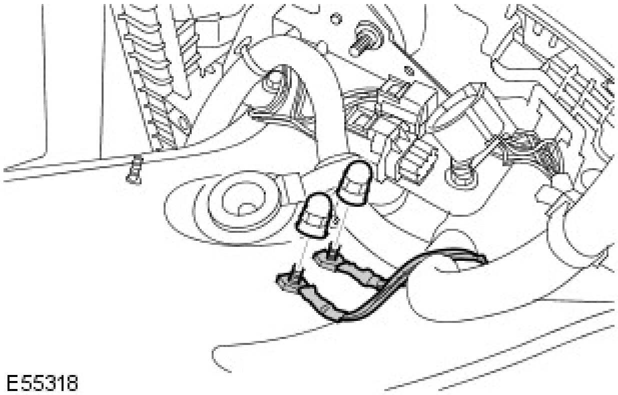
51. RH side: Release the 3 body panel ground cables.

- Remove the nut.



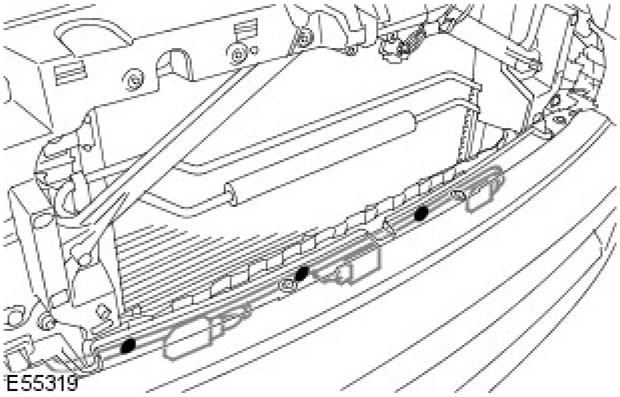
52. RH side: Disconnect the ABS electrical connector.

53. RH side front: Release the air suspension pipe from the wiring harness clip.



54. RH side: Release 2 engine compartment ground cables.

- Remove the 2 nuts.



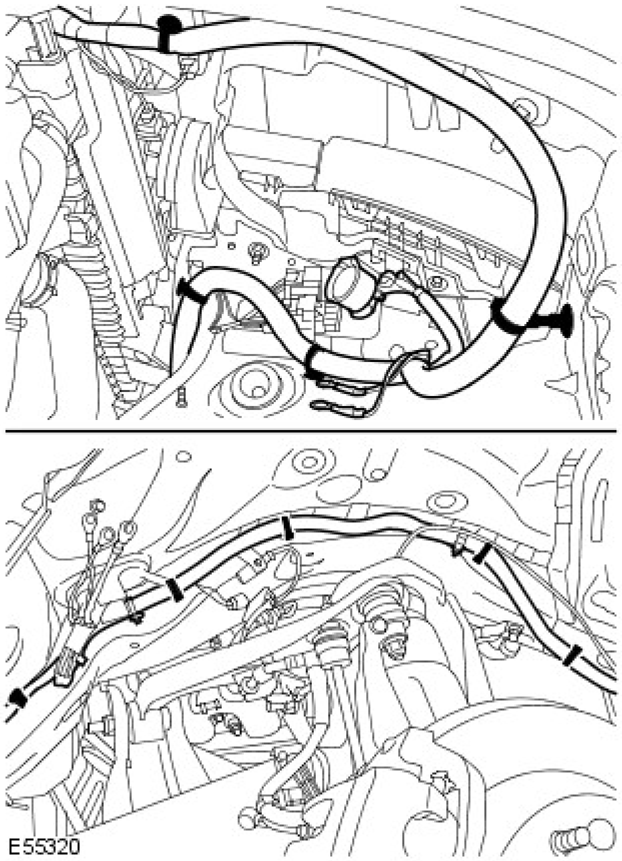
55. Disconnect the ambient air temperature sensor electrical connector.

56. Disconnect both front impact severity sensor electrical connectors.

- Release the 3 clips.

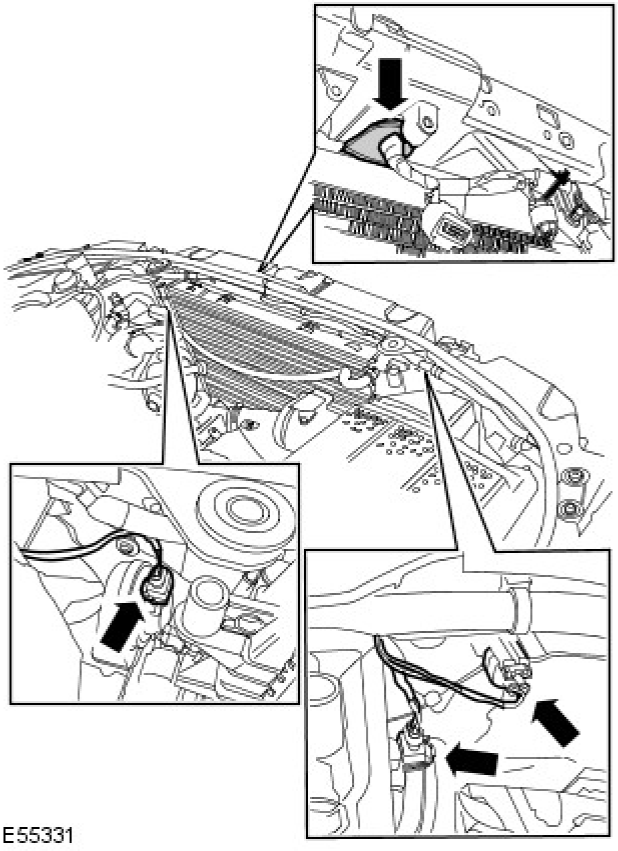
57. RH side: Release the wiring harness.

- Release the 9 clips.



58. Disconnect the hood switch electrical connector.

59. Disconnect both horn electrical connectors.



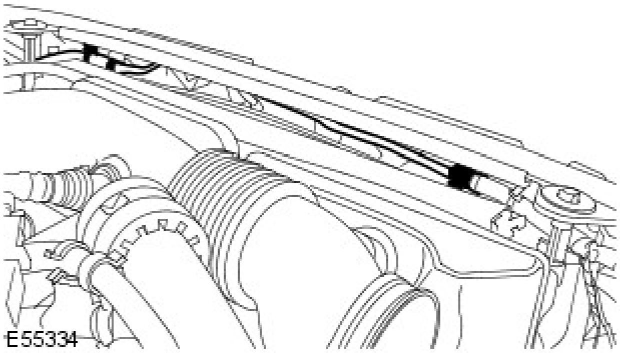
60. If installed, disconnect the speed control module electrical connector.

61. If installed, disconnect the pollution sensor electrical connector.

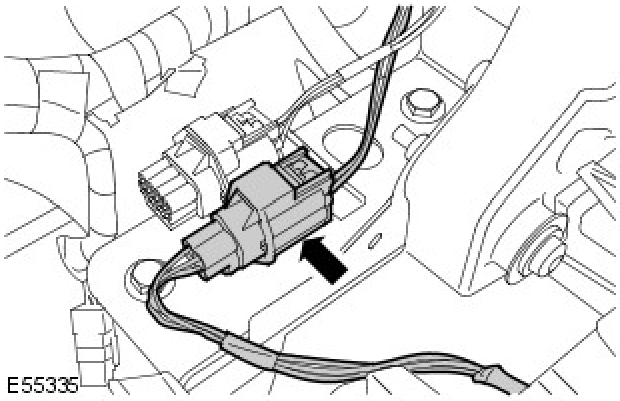
- Release the clip.
- Release the grommet.

62. Release the hood release cable.

- Release from the 3 clips.



63. Disconnect the front bumper wiring harness electrical connector.



64. With assistance, remove the BJB and wiring harness.

Installation

1. With assistance, install the BJB and wiring harness.

2. Connect the front bumper wiring harness electrical connector.

3. Attach the hood release cable.

- Secure with the clips.

4. If installed, connect the pollution sensor electrical connector.

- Install the grommet.
- Secure the clip.

5. If installed, connect the speed control module electrical connector.

6. Connect the horn electrical connectors.

7. Connect the hood switch electrical connector.

8. RH side: Secure the wiring harness.

- Secure the clips.

9. Connect both front impact electrical connectors.

- Secure the clips.

10. RH side: Attach the air suspension pipe.

11. Connect the ambient air temperature sensor electrical connector.

12. RH side: Attach the engine compartment ground cables.

- Tighten the nuts to 25 Nm (18 lb.ft).

13. RH side: Connect the ABS electrical connector.

14. RH side: Attach the body panel ground cables.

- Tighten the nut to 25 Nm (18 lb.ft).

15. RH side: Connect the body panel electrical connectors.

16. Driver side: Attach the wiring harness to the bulkhead.

- Install the grommet.

17. Driver side: Connect the lower A-pillar electrical connectors.

18. Install the air suspension control module.
For additional information, refer to: Air Suspension Control Module (204-05 Vehicle Dynamic Suspension, Removal and Installation).

19. Connect the ABS module electrical connector.

20. Connect the brake fluid reservoir electrical connector.

21. Attach the wiring harness to the plenum.

- Secure the clips.
- Tighten the nuts to 4 Nm (3 lb.ft).

22. Connect the battery to engine compartment wiring harness electrical connector.

23. Connect the A/C pressure transducer electrical connector.

24. Connect the brake booster vacuum pump electrical connector.

25. Attach the hood wiring harness.

- Install the grommet.
- Install the cover.
- Secure with the clips.
- Connect the electrical connectors.
- Connect the washer jet hoses.

26. Install the hood pad.

- Install the clips.

27. Install the windshield wiper motor.
For additional information, refer to: Windshield Wiper Motor (501-16 Wipers and Washers, Removal and Installation).

28. LH side: Attach the wiring harness.

- Install the grommet.
- Secure the clips.

29. LH side: Connect the brake pad wear sensor electrical connector.

30. LH side: Connect the coolant expansion tank level switch electrical connector.

31. LH side: Attach the washer reservoir wiring harness.

- Connect the washer jet hoses.
- Connect the electrical connectors.

32. LH side: Attach the engine compartment ground cables.

- Secure the clips.
- Tighten the nuts to 25 Nm (18 lb.ft).

33. LH side: Connect the ABS electrical connector.

34. LH side: Attach the air suspension pipes.

- Secure the clips.

35. LH side: Attach the body panel ground cables.

- Tighten the nut to 25 Nm (18 lb.ft).

36. LH side: Connect the body panel electrical connectors.

37. LH side: Connect the adaptive front lighting module electrical connector.

38. LH side: Connect the washer jet hose.

39. Passenger side: Connect the transfer case electrical connector.

40. Passenger side: Connect the engine wiring harness electrical connector.

41. Install the headlamps.
For additional information, refer to: Headlamp Assembly (417-01 Exterior Lighting, Removal and Installation).

42. Install the fender splash shields.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

43. Attach the BJB wiring harness to the bulkhead.

- Connect the electrical connectors.
- Install the grommet.

44. Install the battery ground cable.

- Attach the additional ground cable.
- Tighten the nut to 25 Nm (18 lb.ft).

45. Secure the BJB to the bracket.

- Tighten the bolt to 6 Nm (4 lb.ft).

46. Connect the heater motor electrical connector.

47. Connect the ground cables to the lower A-pillar.

- Tighten the nut to 10 Nm (7 lb.ft).

48. Install the CJB bracket.

- Tighten the nuts to 10 Nm (7 lb.ft).
- Secure the clips.
- Connect the electrical connectors.
- Tighten the bolts to 25 Nm (18 lb.ft).

49. Install the CJB.

For additional information, refer to: Central Junction Box (CJB) (418-00 Module Communications Network, Removal and Installation).

50. Connect the battery positive cable to the BJB.

- Tighten the nut to 25 Nm (18 lb.ft).

51. Install the BJB cover.

- Secure the clip.

52. Install the ECM.

- Install the ECM top cover.

53. Install the ECM cover.

- Tighten the Torx screws.
- Connect the electrical connectors.

54. Install the auxiliary battery tray.
For additional information, refer to: Auxiliary Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).

55. Install the battery tray.
For additional information, refer to: Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).

56. Install the four-wheel drive control module.
For additional information, refer to: Four-Wheel Drive (4WD) Control Module (308-07A Four-Wheel Drive Systems, Removal and Installation).

57. Install the air cleaner assembly.
For additional information, refer to: Air Cleaner (303-12A Intake Air Distribution and Filtering - V8 S/C 4.2L Petrol, Removal and Installation).

58. Install the radiator grille.
For additional information, refer to: Radiator Grille (501-08 Exterior Trim and Ornamentation, Removal and Installation).

59. Install the engine cover.
For additional information, refer to: Engine Cover - V8 S/C 4.2L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).

60. Connect the battery ground cable.
For additional information, refer to: Battery Disconnect (414-01, General Procedures).

Published: 11-May-2011

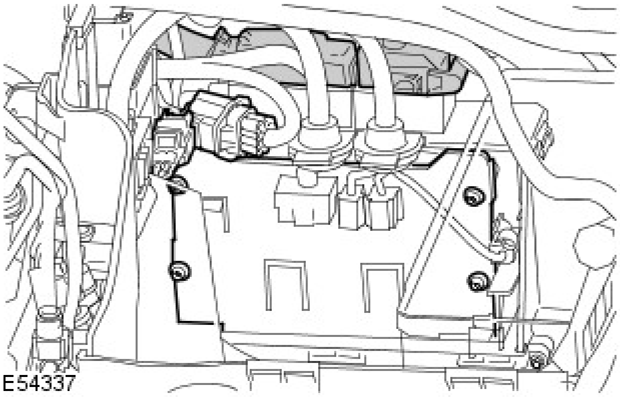
Module Communications Network - Battery Junction Box (BJB)V8 4.4L Petrol

Removal and Installation

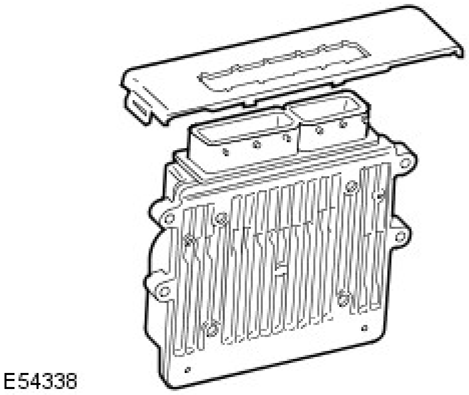
Removal

- NOTE: The BJB is an integral component of the engine compartment wiring harness and cannot be removed separately.

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Make the SRS system safe.
   For additional information, refer to: Standard Workshop Practices (100-00 General Information, Description and Operation).
3. Remove the engine cover.
   For additional information, refer to: Engine Cover - V8 4.4L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).
4. Remove the radiator grille.
   For additional information, refer to: Radiator Grille (501-08 Exterior Trim and Ornamentation, Removal and Installation).
5. Remove the air cleaner assembly.
   For additional information, refer to: Air Cleaner (303-12B Intake Air Distribution and Filtering - V8 4.4L Petrol, Removal and Installation).
6. Remove the four-wheel drive control module.
   For additional information, refer to: Four-Wheel Drive (4WD) Control Module (308-07A Four-Wheel Drive Systems, Removal and Installation).
7. Remove the battery tray.
   For additional information, refer to: Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).
8. Remove the auxiliary battery tray.
   For additional information, refer to: Auxiliary Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).

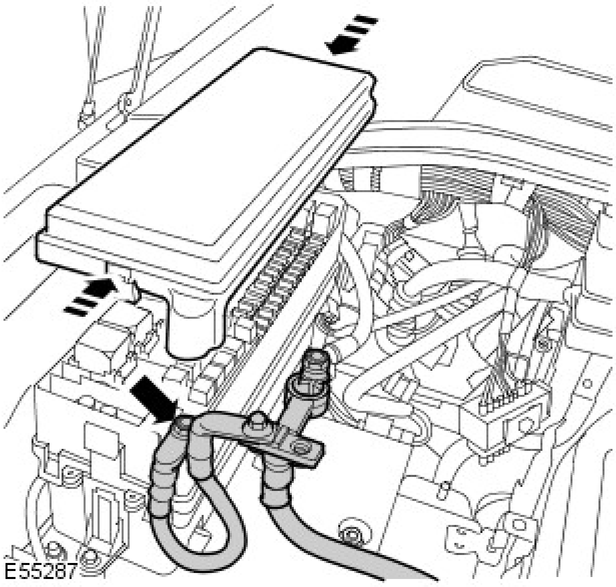


9. Remove the ECM cover.
   - Disconnect 2 electrical connectors for access.
   - Disconnect the 2 ECM electrical connectors.
   - Remove the 4 Torx screws.



10. Remove the ECM.

- Remove the ECM top cover.



11. Remove the BJB cover.

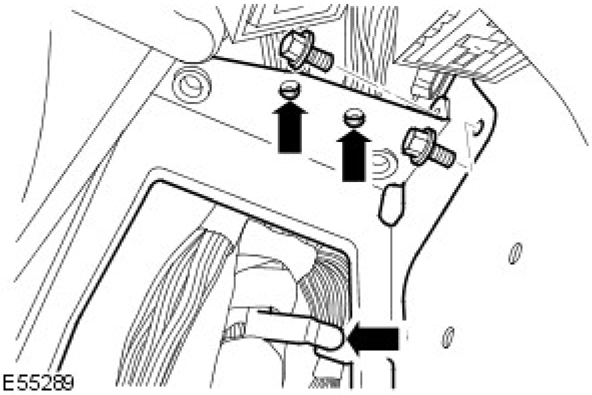
- Release the clip.

12. Disconnect the battery positive cable from the BJB.

- Remove the nut.

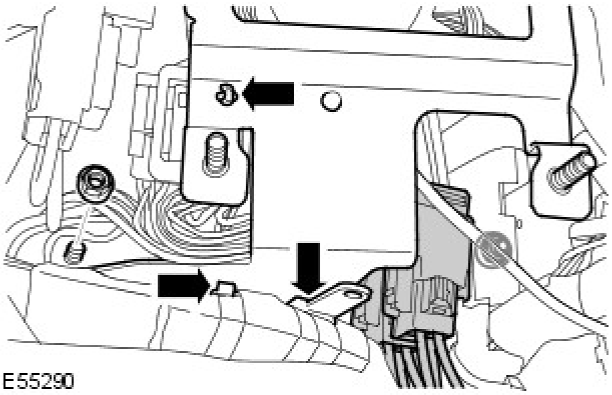
13. Remove both cowl side trim panels.
For additional information, refer to: Cowl Side Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

14. Remove the CJB.
For additional information, refer to: Central Junction Box (CJB) (418-00 Module Communications Network, Removal and Installation).



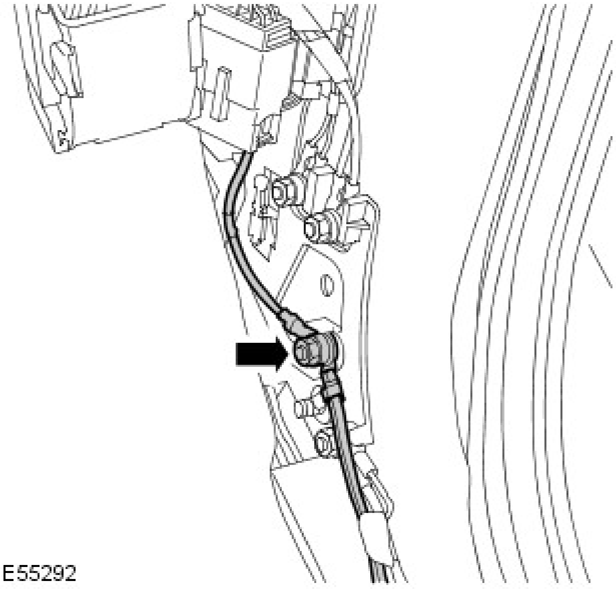
15. Release the CJB bracket.

- Release the 3 upper wiring harness clips.
- Remove the 2 bolts.



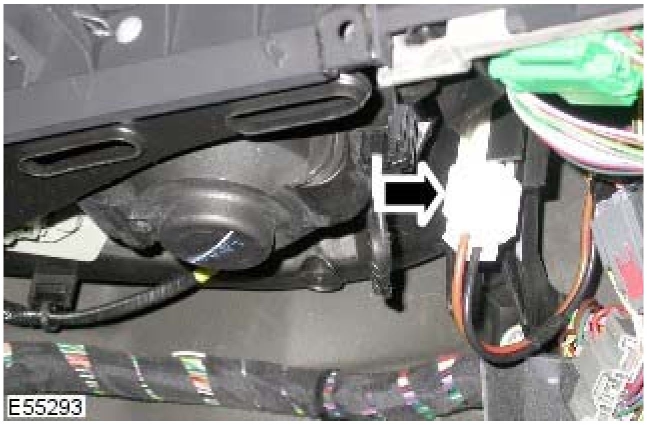
16. Remove the CJB bracket.

- Disconnect the 2 electrical connectors.
- Release the 3 lower wiring harness clips.
- Remove the 2 nuts.

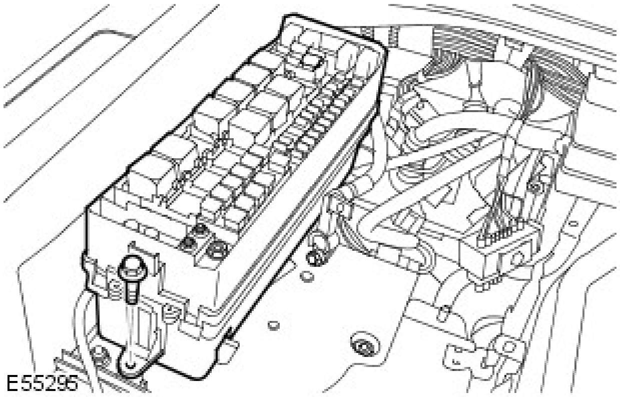


17. Release the 2 ground cables from the lower A-pillar.

- Remove the nut.

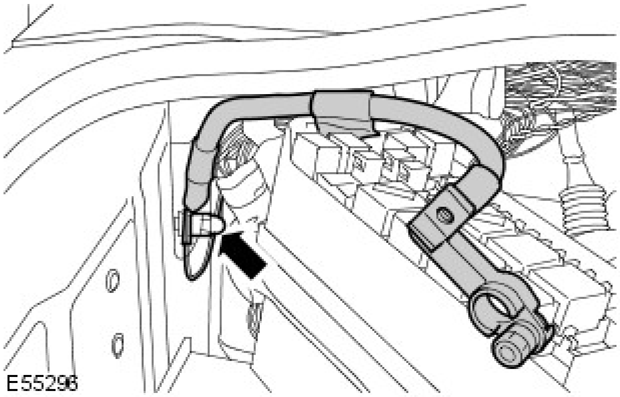


18. Disconnect the heater motor electrical connector.



19. Release the BJB from the bracket.

- Remove the bolt.

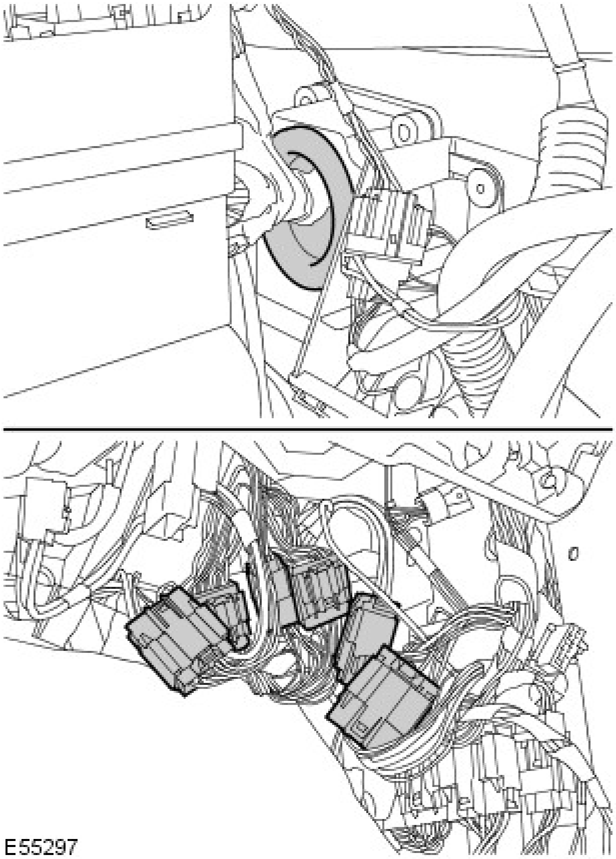


20. Remove the battery ground cable.

- Remove the nut.
- Release the additional ground cable.

21. Release the BJB wiring harness from the bulkhead.

- Disconnect the 6 electrical connectors.
- Release the grommet.



E55297

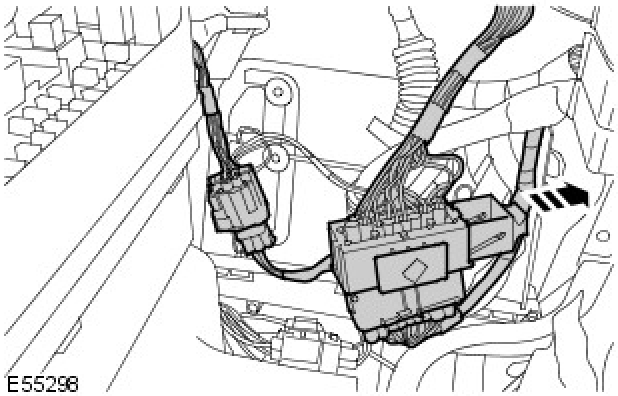
22. Raise and support the vehicle.

23. Remove both front fender splash shields.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

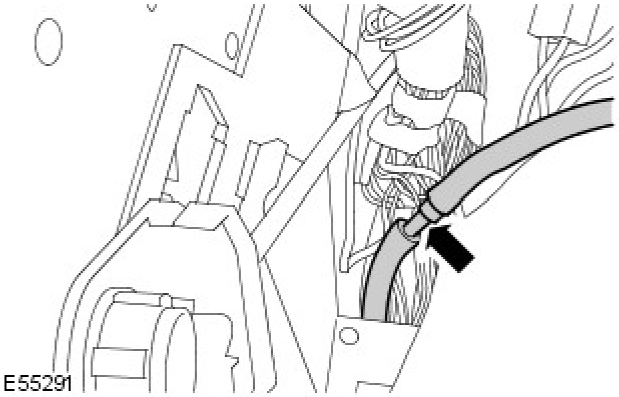
24. Remove both headlamps.
For additional information, refer to: Headlamp Assembly (417-01 Exterior Lighting, Removal and Installation).

25. Passenger side: Disconnect the engine wiring harness electrical connector.

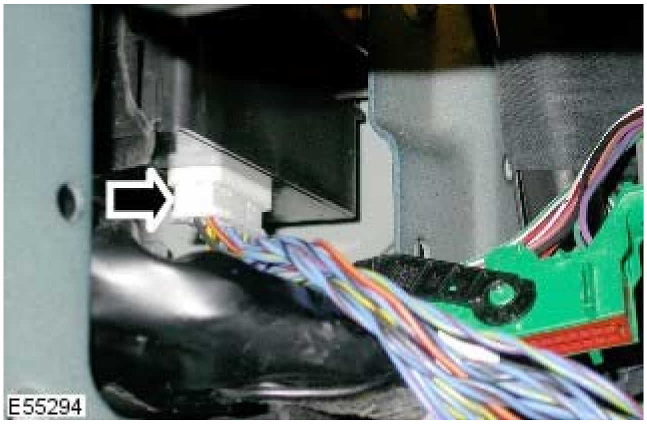
26. Passenger side: Disconnect the transfer case electrical connector.



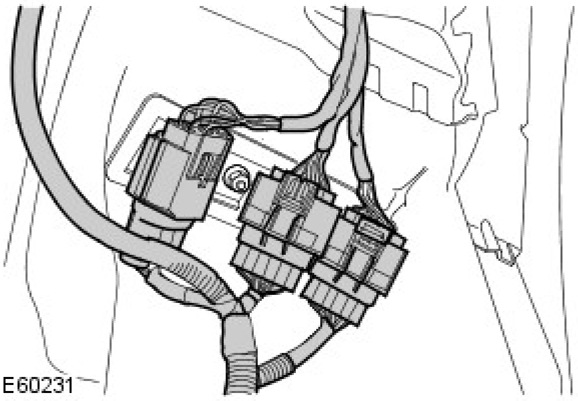
E55298



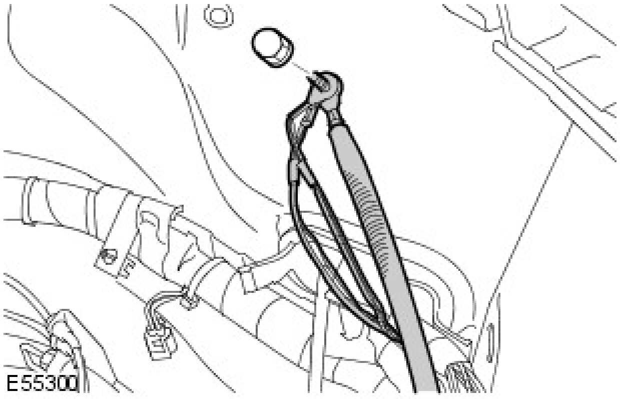
27. LH side: Disconnect the washer jet hose.



28. LH side: Disconnect the adaptive front lighting module electrical connector.



29. LH side: Disconnect the 3 body panel electrical connectors.



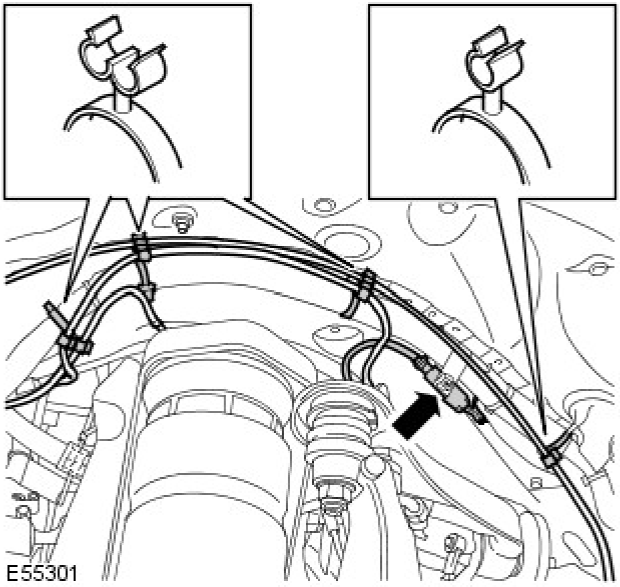
30. LH side: Release the 3 body panel ground cables.

- Remove the nut.

31. LH side: Release the 2 air suspension pipes from the wiring harness.

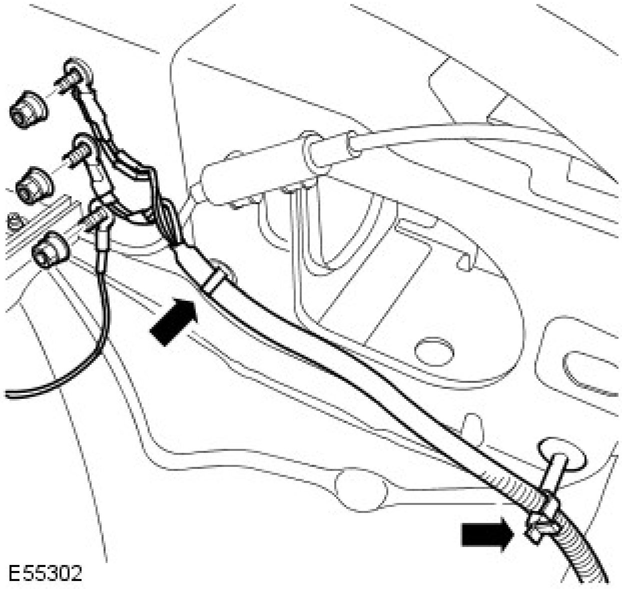
- Release the 7 clips.

32. LH side: Disconnect the ABS electrical connector.



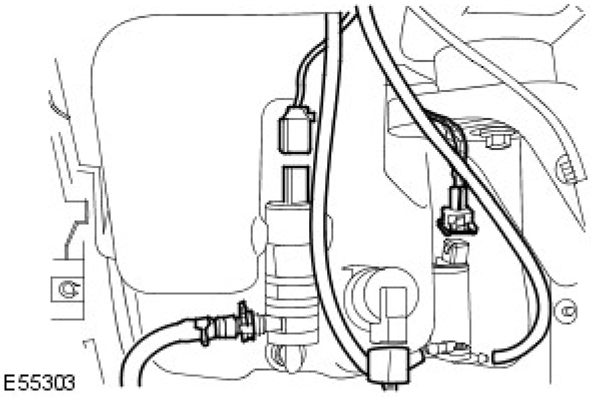
33. LH side: Release 3 engine compartment ground cables.

- Remove the 3 nuts.
- Release the 2 clips.

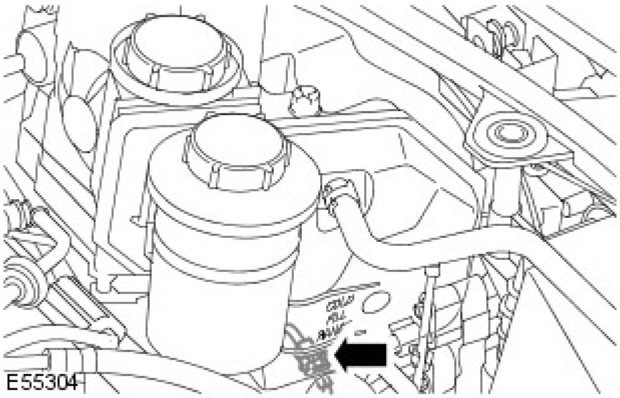


34. LH side: Release the washer reservoir wiring harness.

- Disconnect the 3 electrical connectors.
- Disconnect the 2 washer jet hoses.



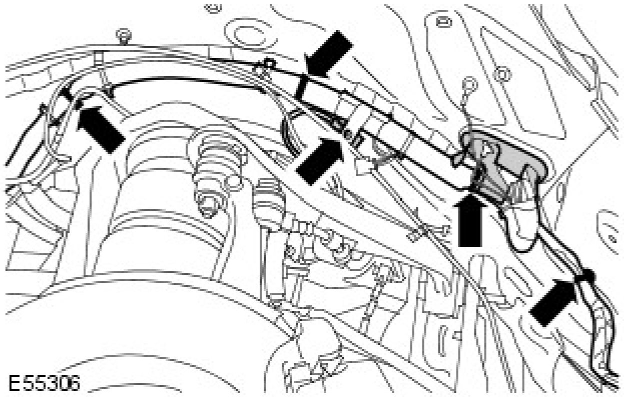
35. LH side: Disconnect the coolant expansion tank level switch electrical connector.



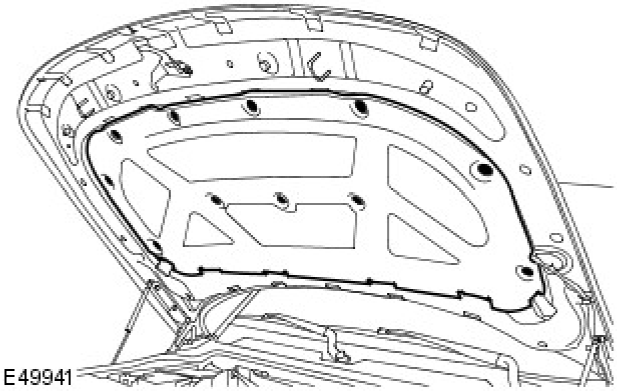
36. LH side: Disconnect the brake pad wear sensor electrical connector.

37. LH side: Release the wiring harness.

- Release the grommet.
- Release the 4 clips.

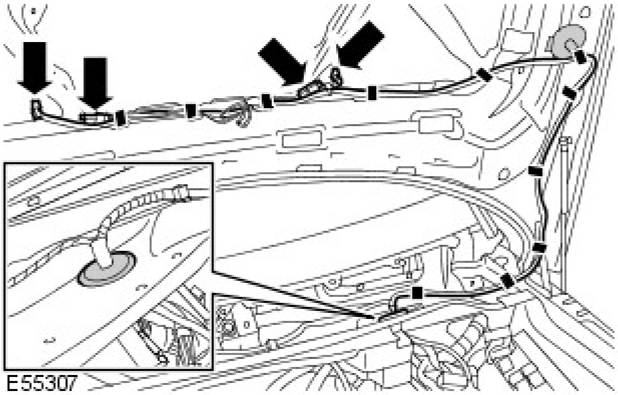


38. Remove the windshield wiper motor.
For additional information, refer to: Windshield Wiper Motor (501-16 Wipers and Washers, Removal and Installation).



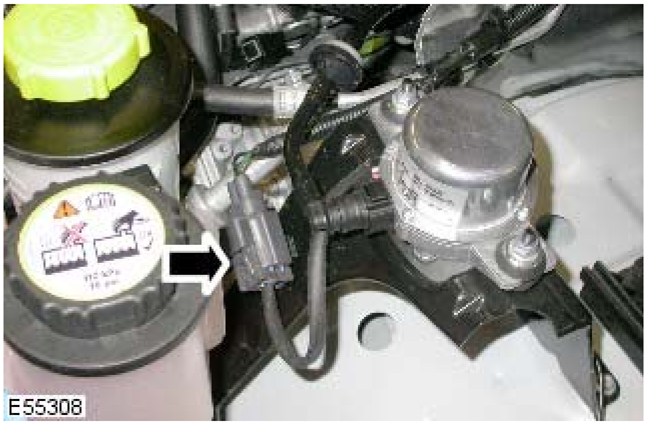
39. Remove the hood pad.

- Remove the 11 clips.

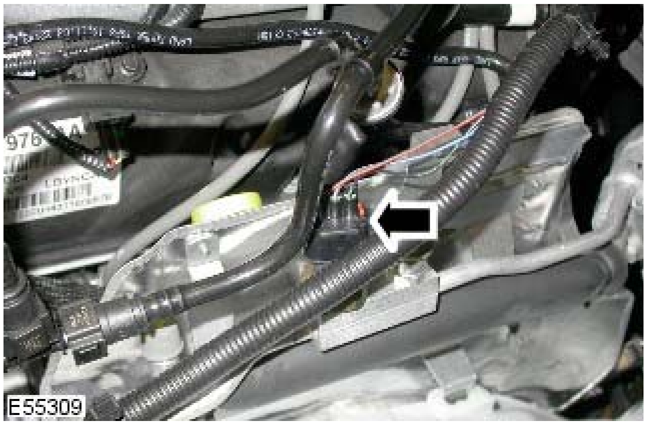


40. Release the hood wiring harness.

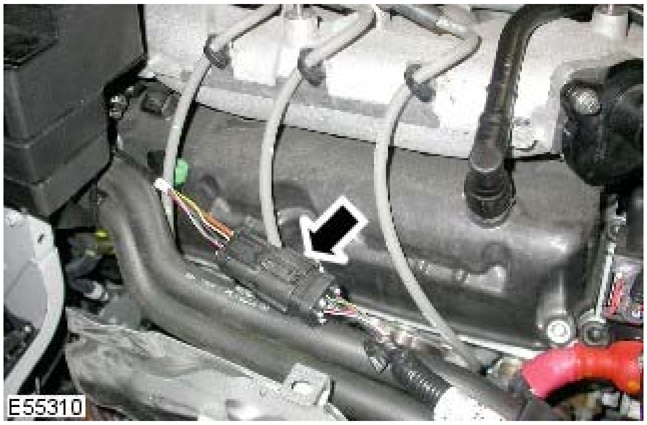
- Disconnect the 2 washer jet hoses.
- Disconnect the 2 electrical connectors.
- Release the 10 clips.
- Remove the wiring harness cover.
- Release the grommet.



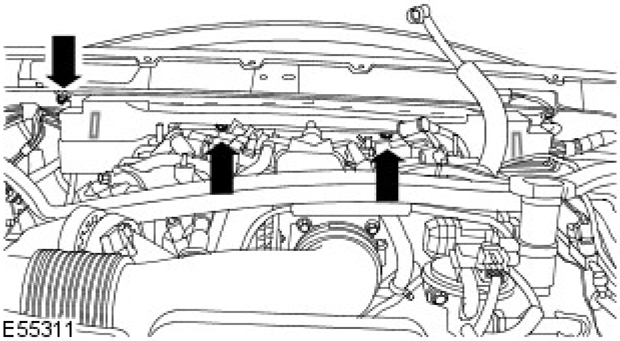
41. Disconnect the brake booster vacuum pump electrical connector.



42. Disconnect the A/C pressure transducer electrical connector.



43. Disconnect the battery to engine compartment wiring harness electrical connector.

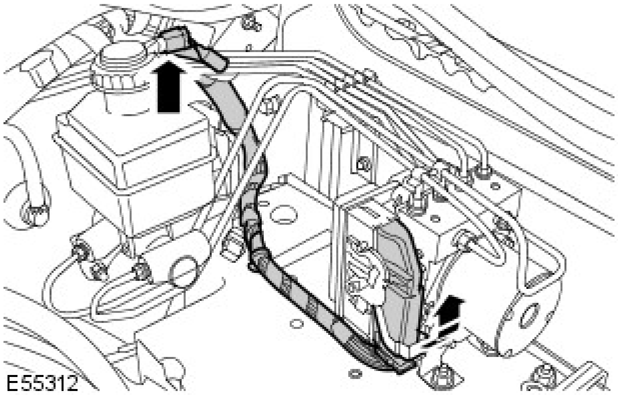


44. Release the wiring harness from the plenum.

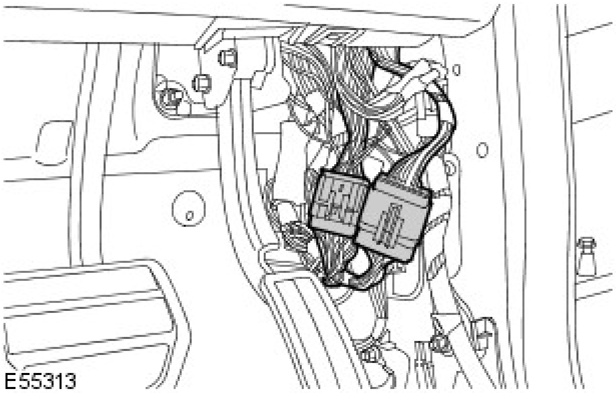
- Release the 2 clips.
- Remove the 3 nuts.

45. Disconnect the brake fluid reservoir electrical connector.

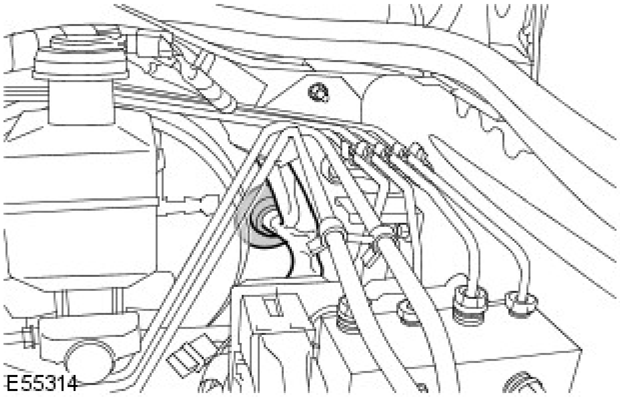
46. Disconnect the ABS module electrical connector.



47. Remove the air suspension control module.
For additional information, refer to: Air Suspension Control Module (204-05 Vehicle Dynamic Suspension, Removal and Installation).

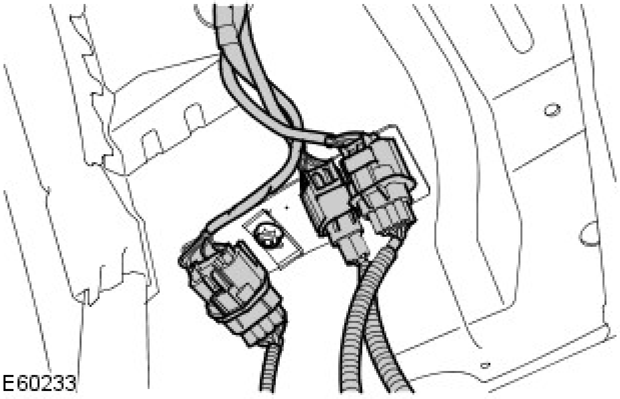


48. Driver side: Disconnect 2 electrical connectors from the lower A-pillar.

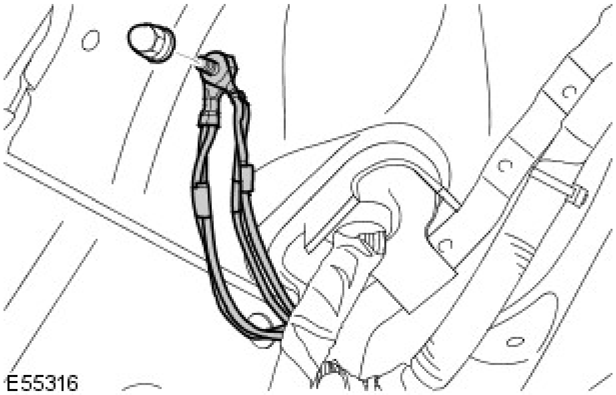


49. Driver side: Release the wiring harness from the bulkhead.

- Release the grommet.



50. RH side: Disconnect the 3 body panel electrical connectors.

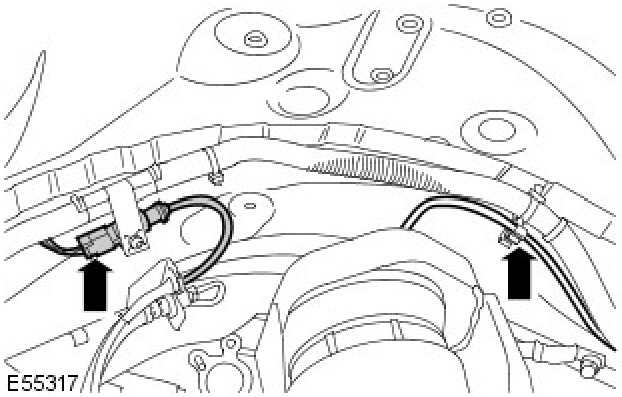


51. RH side: Release the 3 body panel ground cables.

- Remove the nut.

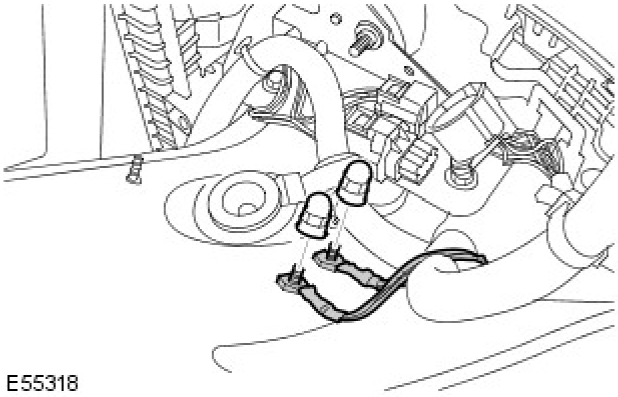
52. RH side: Disconnect the ABS electrical connector.

53. RH side front: Release the air suspension pipe from the wiring harness clip.



54. RH side: Release 2 engine compartment ground cables.

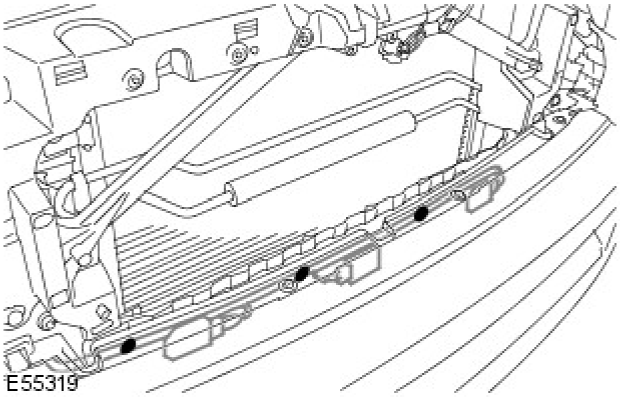
- Remove the 2 nuts.



55. Disconnect the ambient air temperature sensor electrical connector.

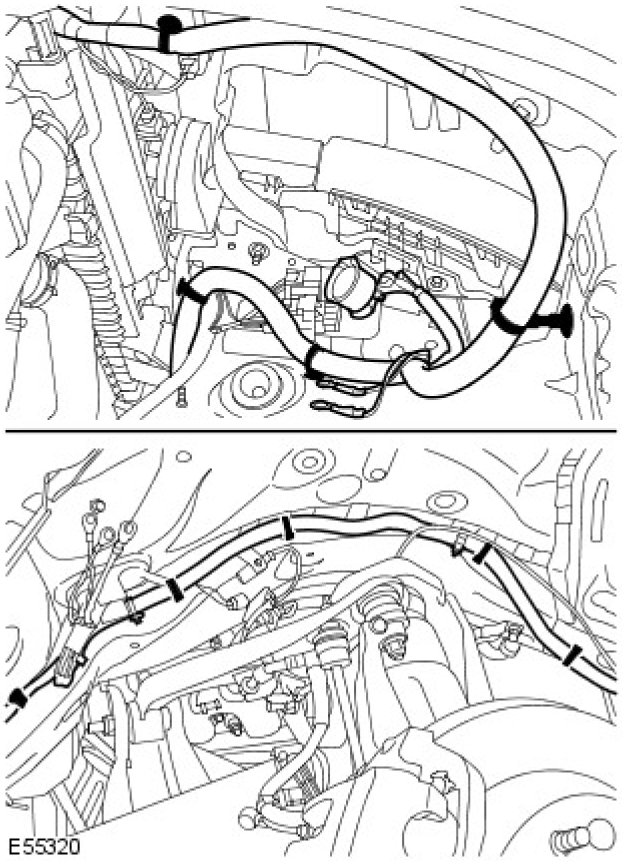
56. Disconnect both front impact severity sensor electrical connectors.

- Release the 3 clips.



57. RH side: Release the wiring harness.

- Release the 9 clips.



58. Disconnect the hood switch electrical connector.

Module Communications Network - Battery Junction Box (BJB)2.7L V6 - TdV6

Removal and Installation

Removal

• NOTE: The BJB is an integral component of the engine compartment wiring harness and cannot be removed separately.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Make the SRS system safe.
For additional information, refer to: Standard Workshop Practices (100-00 General Information, Description and Operation).

3. Remove the engine cover.
For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

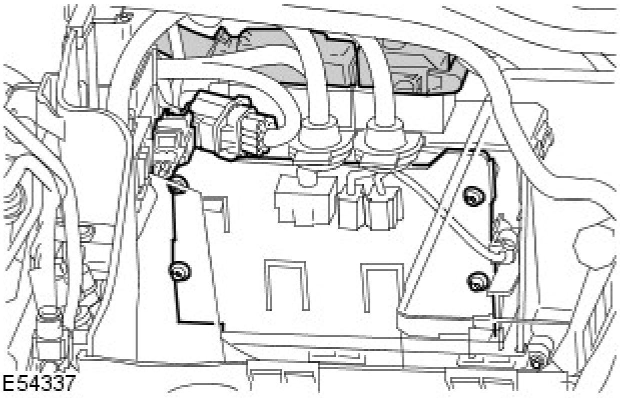
4. Remove the radiator grille.
For additional information, refer to: Radiator Grille (501-08 Exterior Trim and Ornamentation, Removal and Installation).

5. Remove the air cleaner assembly.

6. Remove the four-wheel drive control module.
For additional information, refer to: Four-Wheel Drive (4WD) Control Module (308-07A Four-Wheel Drive Systems, Removal and Installation).

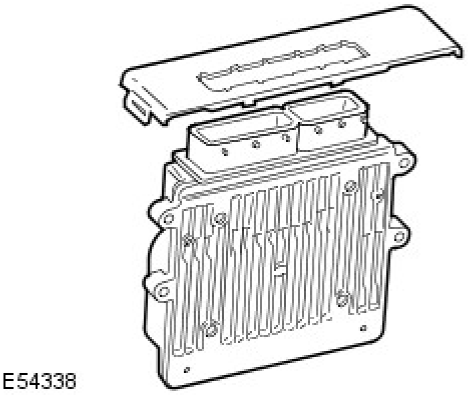
7. Remove the battery tray.
For additional information, refer to: Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).

8. Remove the auxiliary battery tray.
For additional information, refer to: Auxiliary Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).



9. Remove the ECM cover.

- Disconnect 2 electrical connectors for access.
- Disconnect the 2 ECM electrical connectors.
- Remove the 4 Torx screws.



10. Remove the ECM.

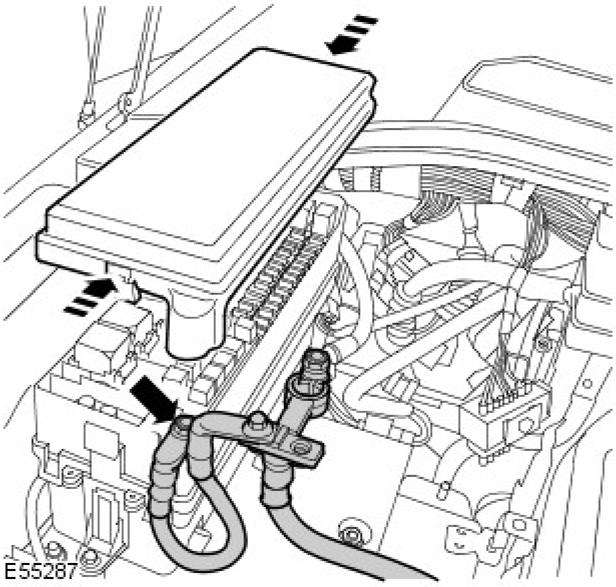
- Remove the ECM top cover.

11. Remove the BJB cover.

- Release the clip.

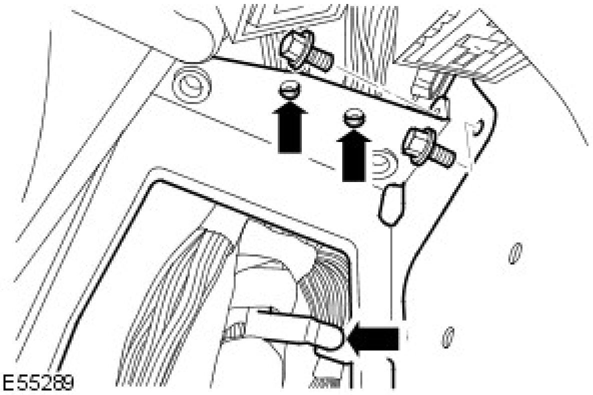
12. Disconnect the battery positive cable from the BJB.

- Remove the nut.



13. Remove both cowl side trim panels.
For additional information, refer to: Cowl Side Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

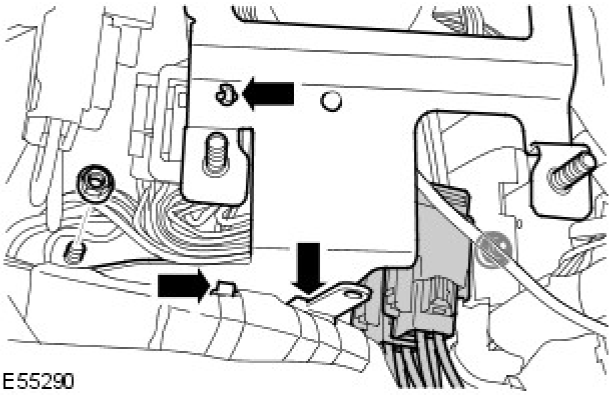
14. Remove the CJB.
For additional information, refer to: Central Junction Box (CJB) (418-00 Module Communications Network, Removal and Installation).



E55289

15. Release the CJB bracket.

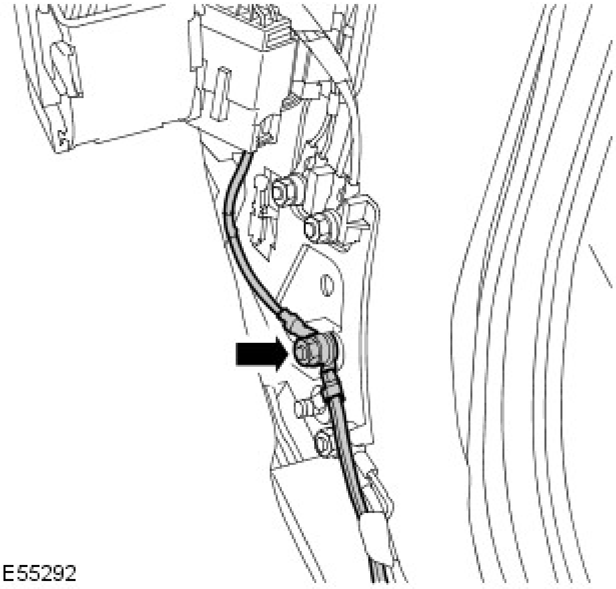
- Release the 3 upper wiring harness clips.
- Remove the 2 bolts.



E55290

16. Remove the CJB bracket.

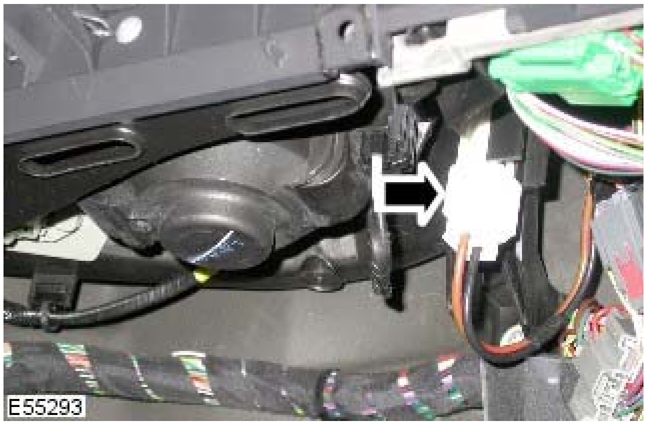
- Disconnect the 2 electrical connectors.
- Release the 3 lower wiring harness clips.
- Remove the 2 nuts.



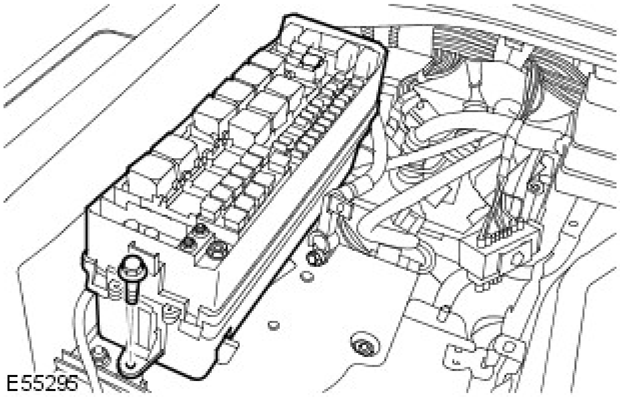
E55292

17. Release the 2 ground cables from the lower A-pillar.

- Remove the nut.

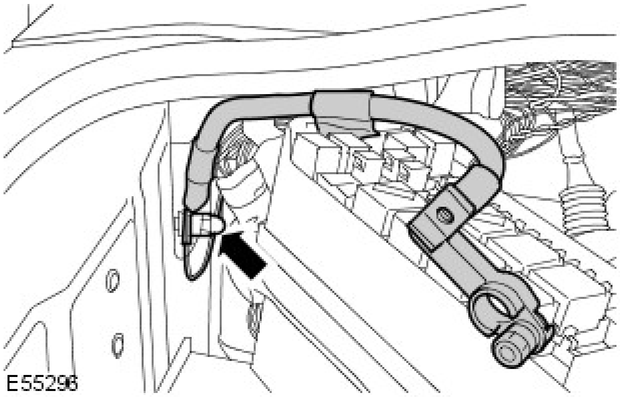


18. Disconnect the heater motor electrical connector.



19. Release the BJB from the bracket.

- Remove the bolt.

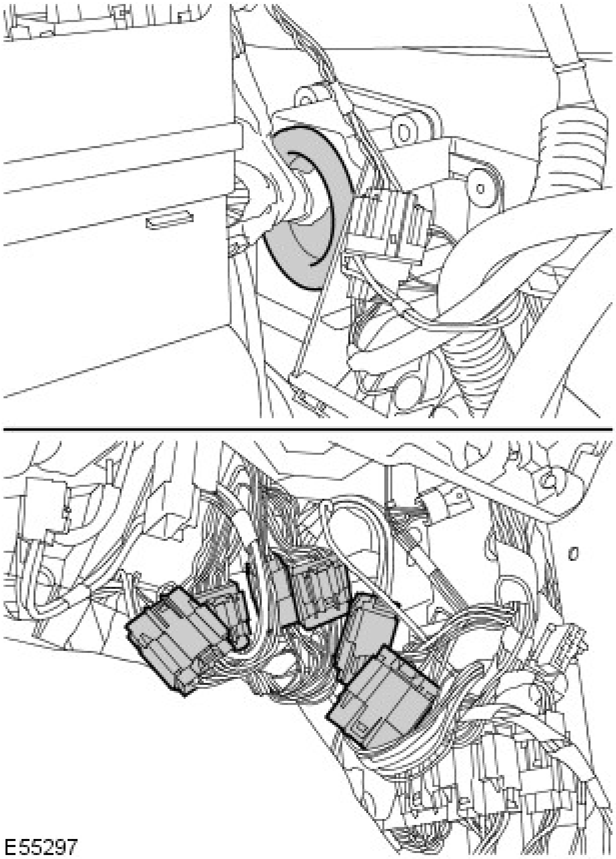


20. Remove the battery ground cable.

- Remove the nut.
- Release the additional ground cable.

21. Release the BJB wiring harness from the bulkhead.

- Disconnect the 6 electrical connectors.
- Release the grommet.



E55297

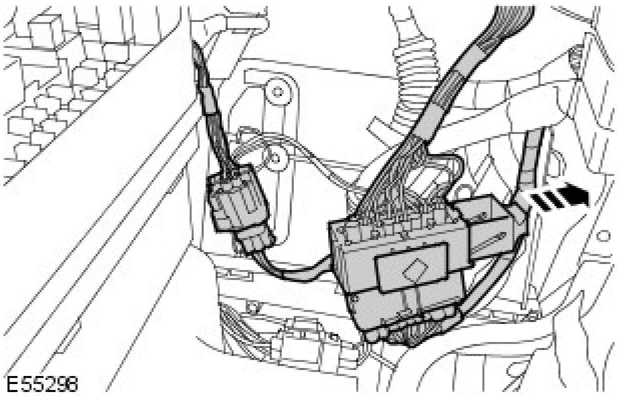
22. Raise and support the vehicle.

23. Remove both front fender splash shields.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

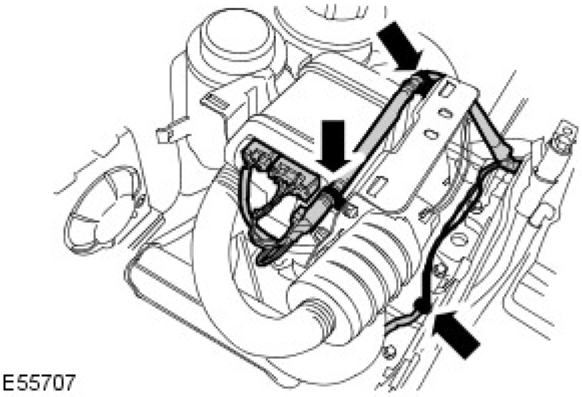
24. Remove both headlamps.
For additional information, refer to: Headlamp Assembly (417-01 Exterior Lighting, Removal and Installation).

25. Passenger side: Disconnect the engine wiring harness electrical connector.

26. Passenger side: Disconnect the transfer case electrical connector.

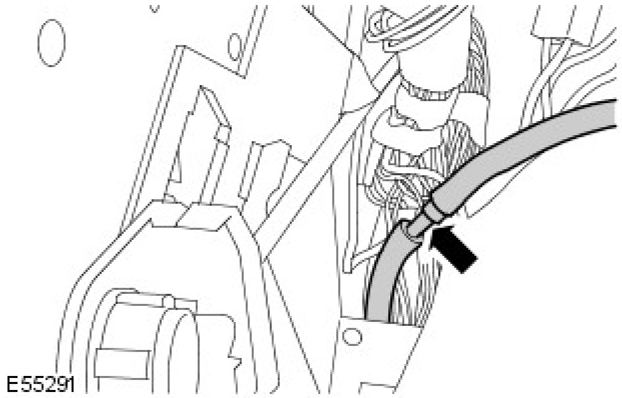


E55298

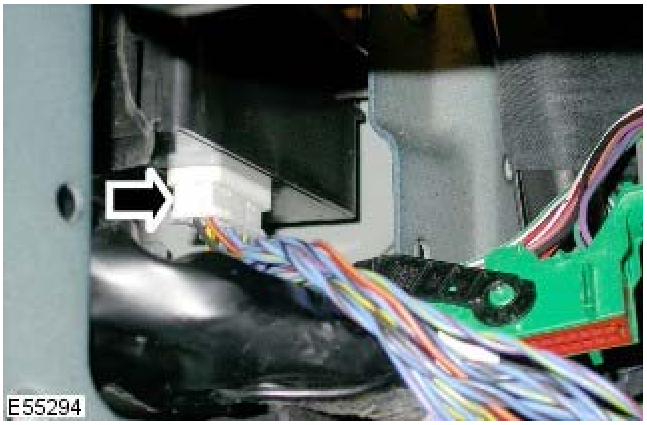


27. LH side: Release the wiring harness from the fuel fired heater.

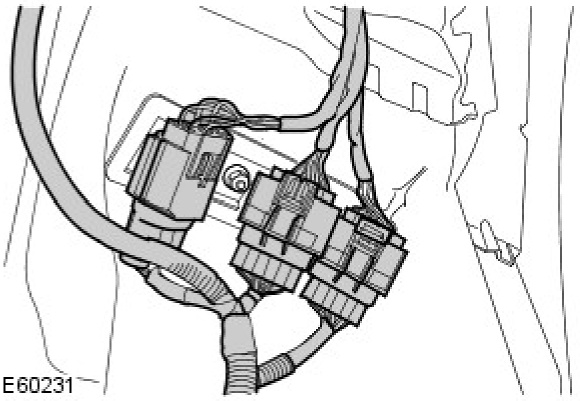
- Disconnect the 3 electrical connectors.
- Release the 3 clips.



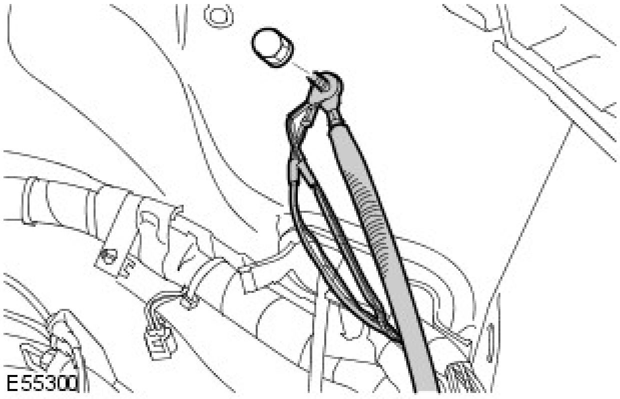
28. LH side: Disconnect the washer jet hose.



29. LH side: Disconnect the adaptive front lighting module electrical connector.



30. LH side: Disconnect the 3 body panel electrical connectors.



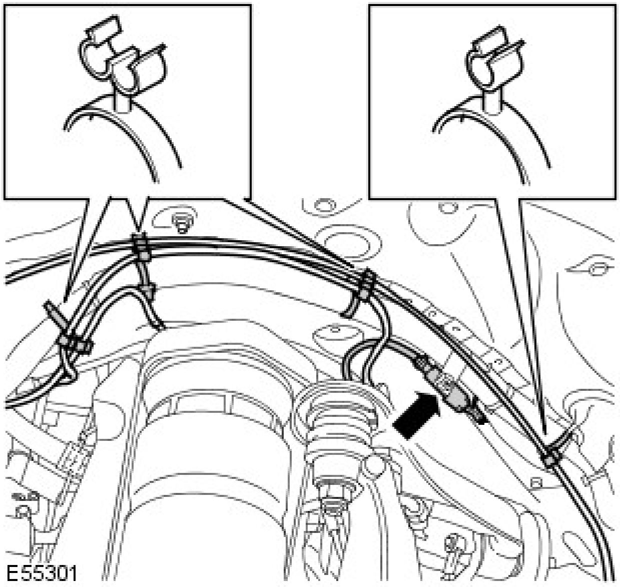
31. LH side: Release the 3 body panel ground cables.

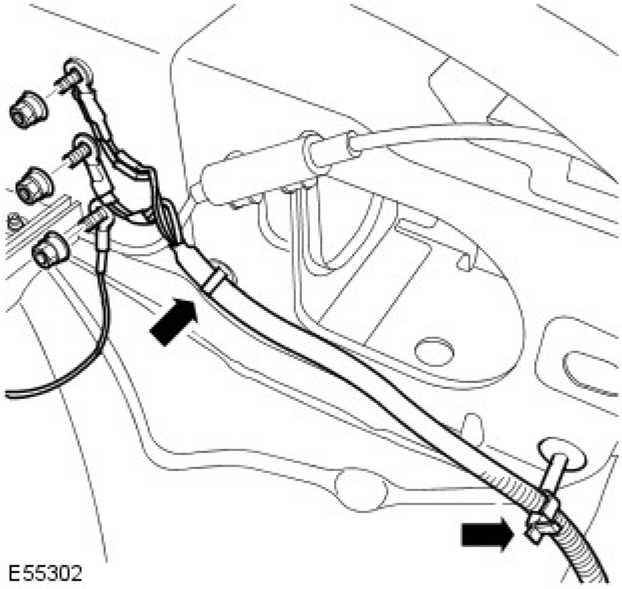
- Remove the nut.

32. LH side: Release the 2 air suspension pipes from the wiring harness.

- Release the 7 clips.

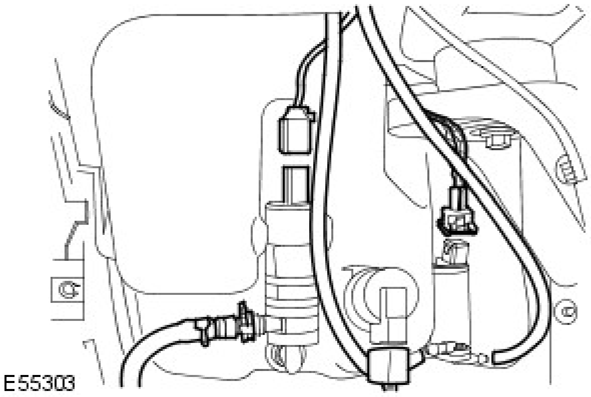
33. LH side: Disconnect the ABS electrical connector.





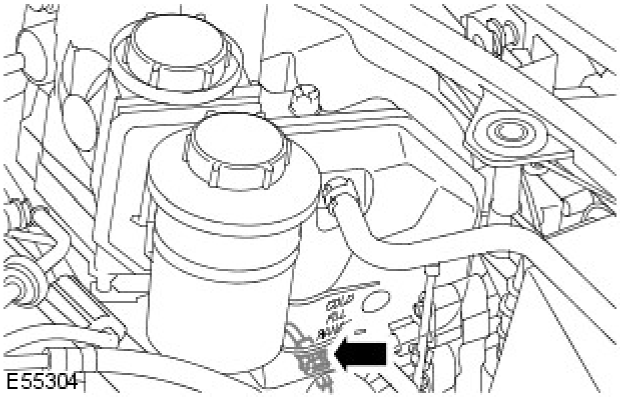
34. LH side: Release 3 engine compartment ground cables.

- Remove the 3 nuts.
- Release the 2 clips.



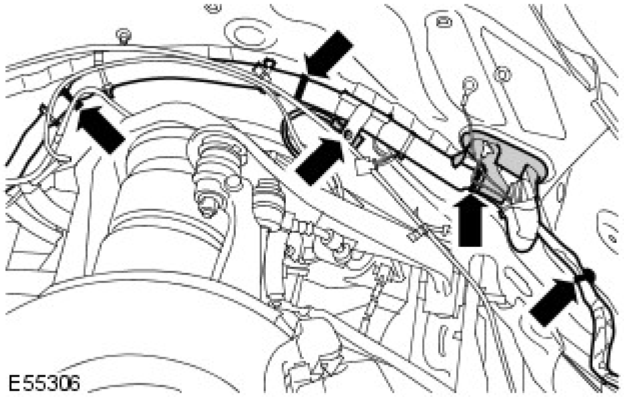
35. LH side: Release the washer reservoir wiring harness.

- Disconnect the 3 electrical connectors.
- Disconnect the 2 washer jet hoses.



36. LH side: Disconnect the coolant expansion tank level switch electrical connector.

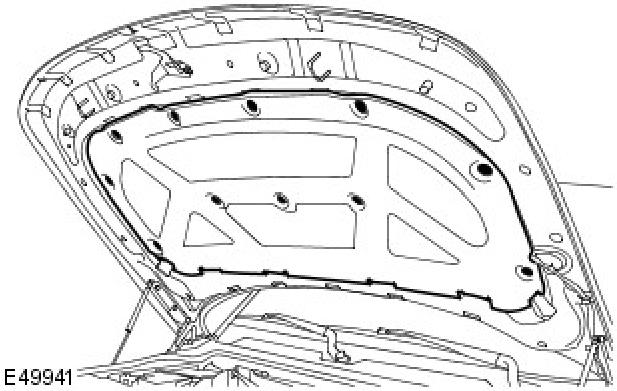
37. LH side: Disconnect the brake pad wear sensor electrical connector.



38. LH side: Release the wiring harness.

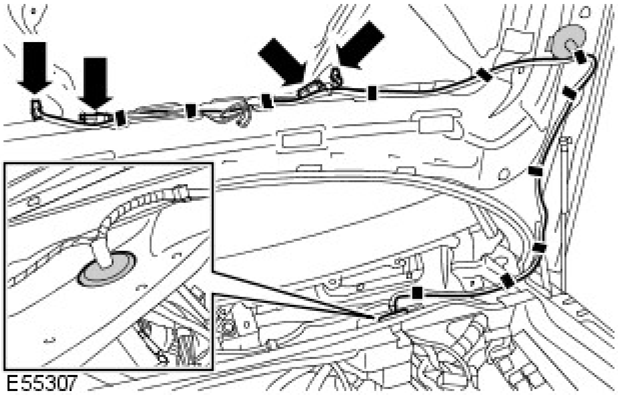
- Release the grommet.
- Release the 4 clips.

39. Remove the windshield wiper motor.
For additional information, refer to: Windshield Wiper Motor (501-16 Wipers and Washers, Removal and Installation).



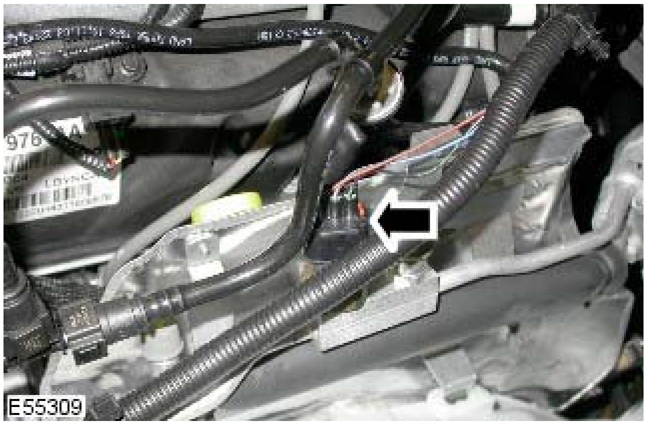
40. Remove the hood pad.

- Remove the 11 clips.

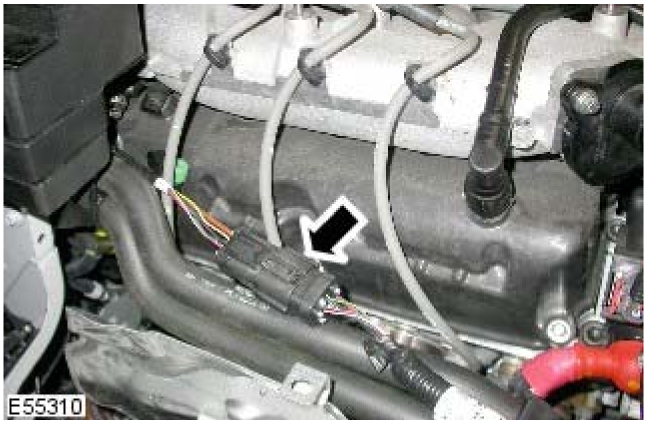


41. Release the hood wiring harness.

- Disconnect the 2 washer jet hoses.
- Disconnect the 2 electrical connectors.
- Release the 10 clips.
- Remove the wiring harness cover.
- Release the grommet.

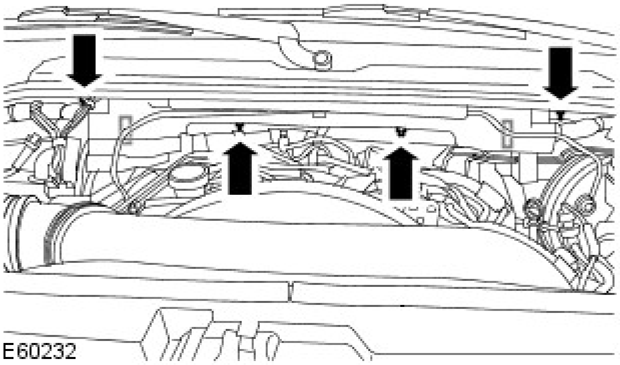


42. Disconnect the A/C pressure transducer electrical connector.



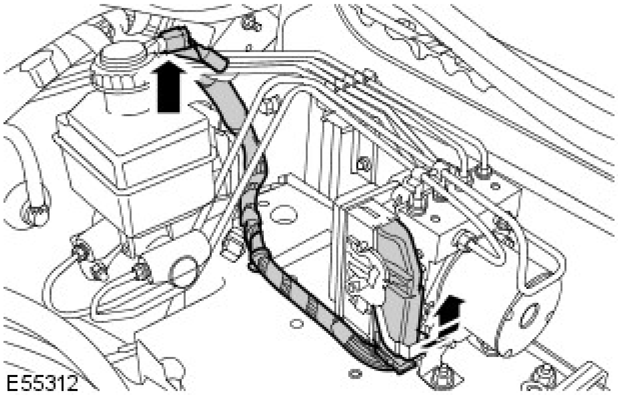
43. NOTE: 4.0L illustration shown, 2.7L Diesel is similar.

Disconnect the battery to engine compartment wiring harness electrical connector.



44. Release the wiring harness from the plenum.

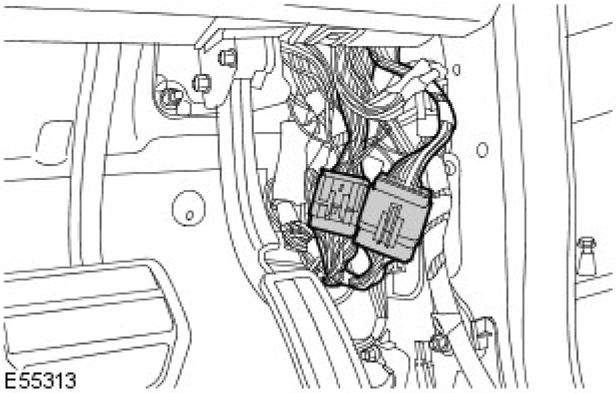
- Remove the 3 nuts.
- Release the clip.



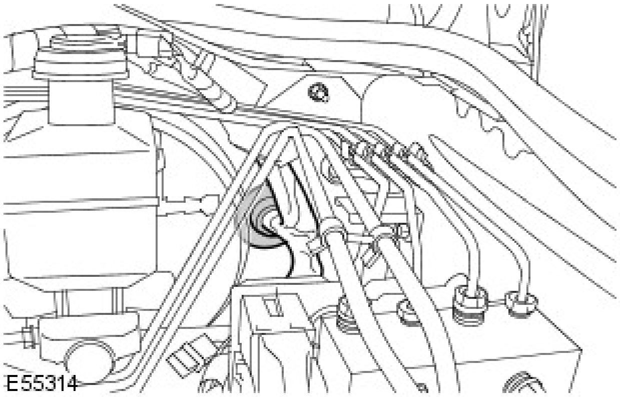
45. Disconnect the brake fluid reservoir electrical connector.

46. Disconnect the ABS module electrical connector.

47. Remove the air suspension control module.
For additional information, refer to: Air Suspension Control Module (204-05 Vehicle Dynamic Suspension, Removal and Installation).

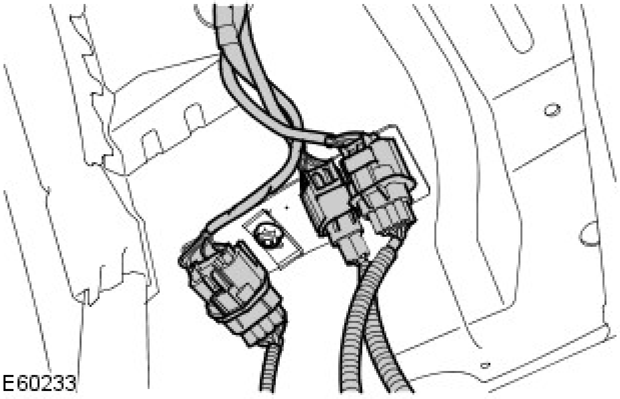


48. Driver side: Disconnect 2 electrical connectors from the lower A-pillar.

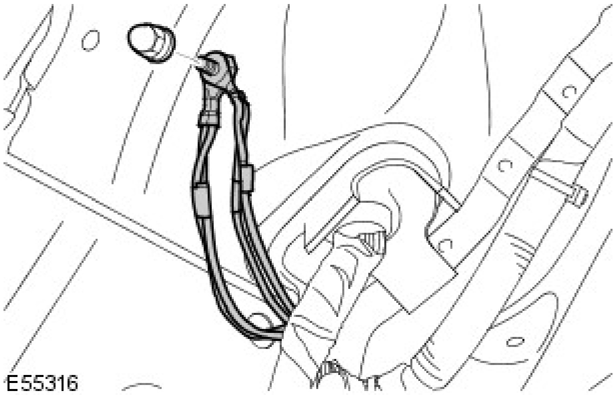


49. Driver side: Release the wiring harness from the bulkhead.

- Release the grommet.



50. RH side: Disconnect the 3 body panel electrical connectors.



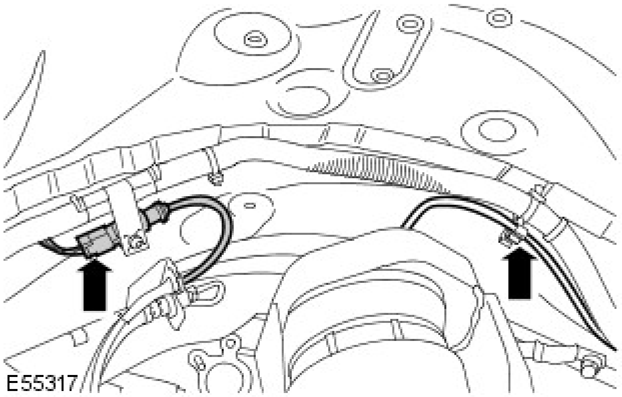
E55316

51. RH side: Release the 3 body panel ground cables.

- Remove the nut.

52. RH side: Disconnect the ABS electrical connector.

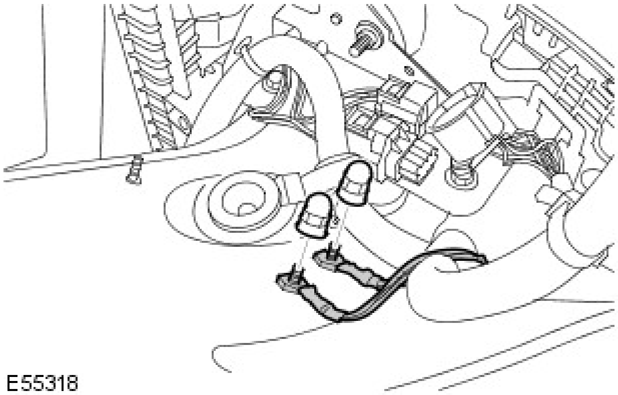
53. RH side front: Release the air suspension pipe from the wiring harness clip.



E55317

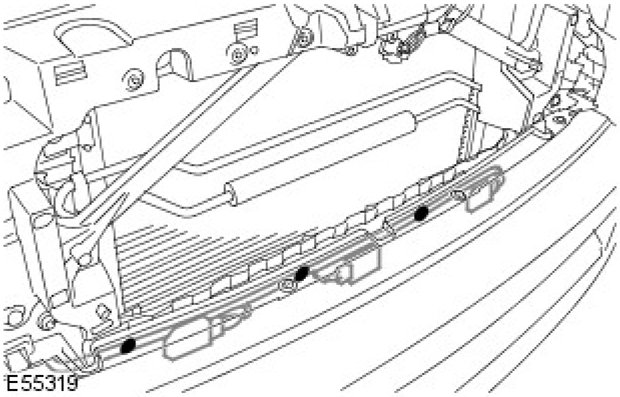
54. RH side: Release 2 engine compartment ground cables.

- Remove the 2 nuts.



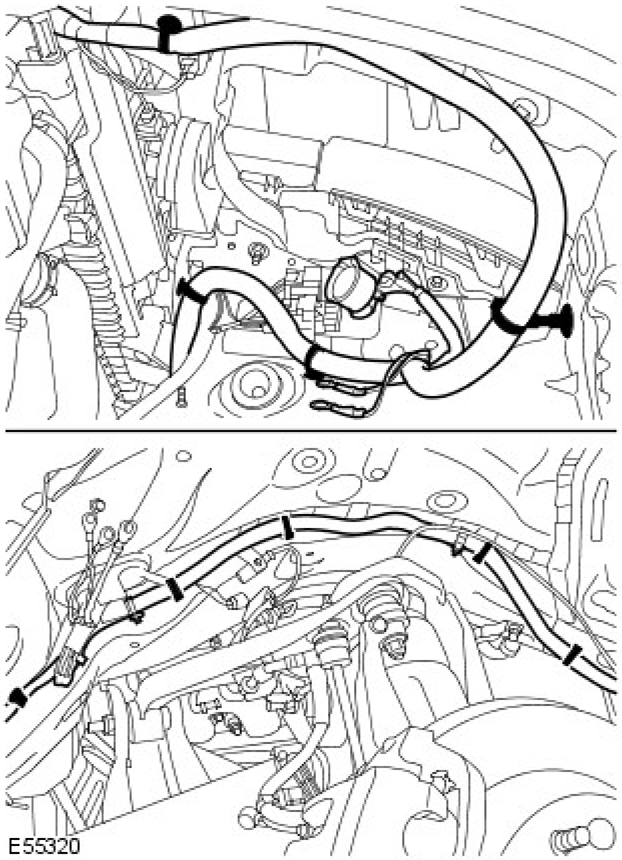
E55318

55. Disconnect the ambient air temperature sensor electrical connector.



56. Disconnect both front impact severity sensor electrical connectors.

- Release the 3 clips.

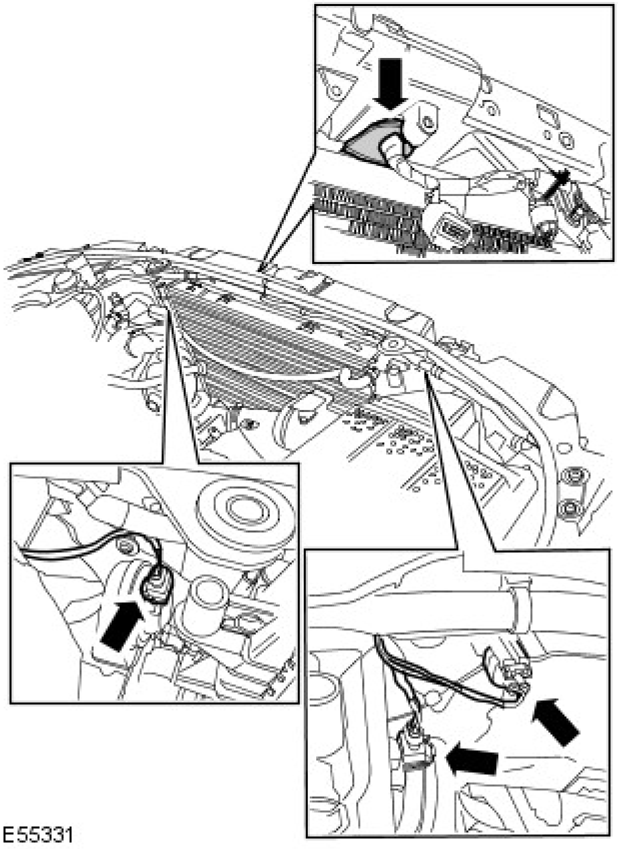


57. RH side: Release the wiring harness.

- Release the 9 clips.

58. Disconnect the hood switch electrical connector.

59. Disconnect both horn electrical connectors.



60. If installed, disconnect the speed control module electrical connector.

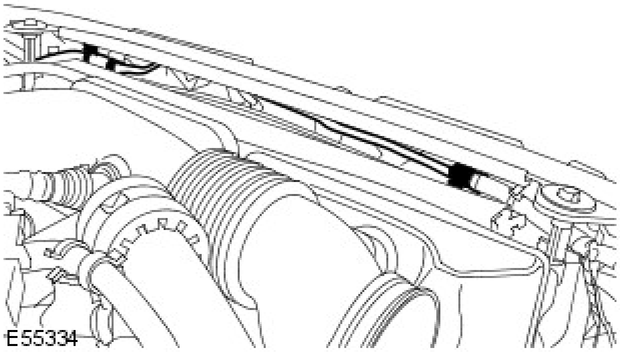
61. If installed, disconnect the pollution sensor electrical connector.

- Release the clip.
- Release the grommet.

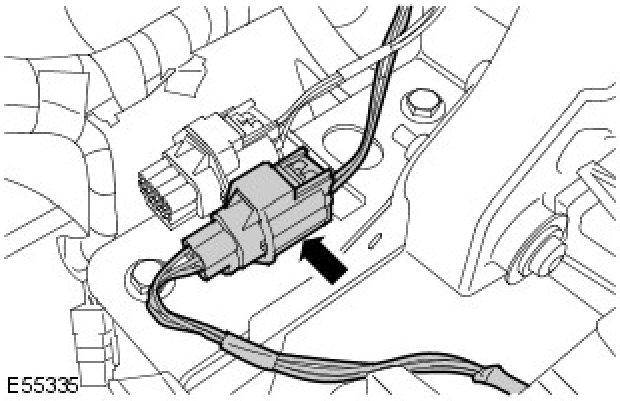
62. NOTE: 4.0L illustration shown, 2.7L Diesel is similar.

Release the hood release cable.

- Release from the 3 clips.



63. Disconnect the front bumper wiring harness electrical connector.



64. With assistance, remove the BJB and wiring harness.

Installation

1. With assistance, install the BJB and wiring harness.

2. Connect the front bumper wiring harness electrical connector.

3. Attach the hood release cable.

- Secure with the clips.

4. If installed, connect the pollution sensor electrical connector.

- Install the grommet.
- Secure the clip.

5. If installed, connect the speed control module electrical connector.

6. Connect the horn electrical connectors.

7. Connect the hood switch electrical connector.

8. RH side: Secure the wiring harness.

- Secure the clips.

9. Connect both front impact electrical connectors.

- Secure the clips.

10. RH side: Attach the air suspension pipe.

11. Connect the ambient air temperature sensor electrical connector.

12. RH side: Attach the engine compartment ground cables.

- Tighten the nuts to 25 Nm (18 lb.ft).

13. RH side: Connect the ABS electrical connector.

14. RH side: Attach the body panel ground cables.

- Tighten the nut to 25 Nm (18 lb.ft).

15. RH side: Connect the body panel electrical connectors.

16. Driver side: Attach the wiring harness to the bulkhead.

- Install the grommet.

17. Driver side: Connect the lower A-pillar electrical connectors.

18. Install the air suspension control module.
For additional information, refer to: Air Suspension Control Module (204-05 Vehicle Dynamic Suspension, Removal and Installation).

19. Connect the ABS module electrical connector.

20. Connect the brake fluid reservoir electrical connector.

21. Attach the wiring harness to the plenum.

- Secure the clips.
- Tighten the nuts to 4 Nm (3 lb.ft).

22. Connect the battery to engine compartment wiring harness electrical connector.

23. Connect the A/C pressure transducer electrical connector.

24. Attach the hood wiring harness.

- Install the grommet.
- Install the cover.
- Secure with the clips.
- Connect the electrical connectors.
- Connect the washer jet hoses.

25. Install the hood pad.

- Install the clips.

26. Install the windshield wiper motor.
For additional information, refer to: Windshield Wiper Motor (501-16 Wipers and Washers, Removal and Installation).

27. LH side: Attach the wiring harness.

- Install the grommet.
- Secure the clips.

28. LH side: Connect the brake pad wear sensor electrical connector.

29. LH side: Connect the coolant expansion tank level switch electrical connector.

30. LH side: Attach the washer reservoir wiring harness.

- Connect the washer jet hoses.
- Connect the electrical connectors.

31. LH side: Attach the engine compartment ground cables.

- Secure the clips.
- Tighten the nuts to 25 Nm (18 lb.ft).

32. LH side: Connect the ABS electrical connector.

33. LH side: Attach the air suspension pipes.

- Secure the clips.

34. LH side: Attach the body panel ground cables.

- Tighten the nut to 25 Nm (18 lb.ft).

35. LH side: Connect the body panel electrical connectors.

36. LH side: Connect the adaptive front lighting module electrical connector.

37. LH side: Connect the washer jet hose.

38. LH side: Attach the wiring harness to the fuel fired heater.

- Connect the electrical connectors.
- Secure with the clips.

39. Passenger side: Connect the transfer case electrical connector.

40. Passenger side: Connect the engine wiring harness electrical connector.

41. Install the headlamps.
For additional information, refer to: Headlamp Assembly (417-01 Exterior Lighting, Removal and Installation).

42. Install the fender splash shields.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

43. Attach the BJB wiring harness to the bulkhead.

- Connect the electrical connectors.
- Install the grommet.

44. Install the battery ground cable.

- Attach the additional ground cable.
- Tighten the nut to 25 Nm (18 lb.ft).

45. Secure the BJB to the bracket.

- Tighten the bolt to 6 Nm (4 lb.ft).

46. Connect the heater motor electrical connector.

47. Connect the ground cables to the lower A-pillar.

- Tighten the nut to 10 Nm (7 lb.ft).

48. Install the CJB bracket.

- Tighten the nuts to 10 Nm (7 lb.ft).
- Secure the clips.
- Connect the electrical connectors.
- Tighten the bolts to 25 Nm (18 lb.ft).

49. Install the CJB.
For additional information, refer to: Central Junction Box (CJB) (418-00 Module Communications Network, Removal and Installation).

50. Connect the battery positive cable to the BJB.

- Tighten the nut to 25 Nm (18 lb.ft).

51. Install the BJB cover.

- Secure the clip.

52. Install the ECM.

- Install the ECM top cover.

53. Install the ECM cover.

- Tighten the Torx screws.
- Connect the electrical connectors.

54. Install the auxiliary battery tray.
For additional information, refer to: Auxiliary Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).

55. Install the battery tray.
For additional information, refer to: Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).

56. Install the four-wheel drive control module.
For additional information, refer to: Four-Wheel Drive (4WD) Control Module (308-07A Four-Wheel Drive Systems, Removal and Installation).

57. Install the air cleaner assembly.

58. Install the radiator grille.
For additional information, refer to: Radiator Grille (501-08 Exterior Trim and Ornamentation, Removal and Installation).

59. Install the engine cover.
For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

60. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

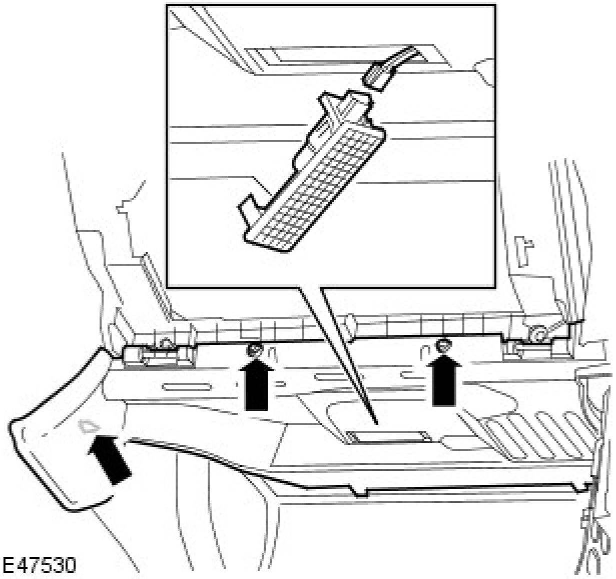
Module Communications Network - Central Junction Box (CJB)

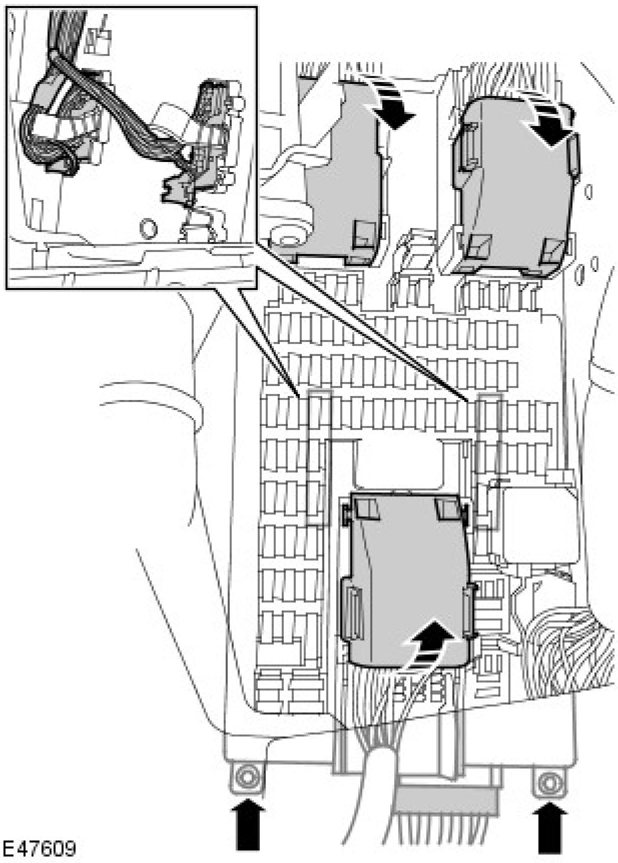
Removal and Installation

Removal

1. If the central junction box (CJB) is to be replaced, connect T4 to the vehicle.
2. Remove the glove compartment.
   For additional information, refer to: Glove Compartment (501-12 Instrument Panel and Console, Removal and Installation).



3. Remove the passenger side closing trim panel.
   - Release the clip.
   - Remove the 2 screws.
   - Disconnect the electrical connector.



4. Remove the CJB.

- Remove the 2 nuts.
- Disconnect the 6 electrical connectors.

Installation

1. Install the CJB.

- Connect the electrical connectors.
- Tighten the nuts to 10 Nm (7 lb.ft).

2. Install the closing trim panel.

- Connect the electrical connector.
- Secure the clip.

3. Install the glove compartment.
For additional information, refer to: Glove Compartment (501-12 Instrument Panel and Console, Removal and Installation).

4. Initiate a new CJB using T4.

Wiring Harnesses - Engine Wiring HarnessTDV8 3.6L Diesel

Removal and Installation

Removal

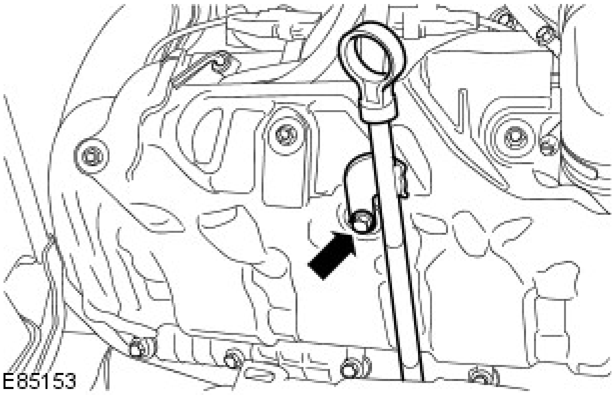
1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Remove the engine cover.
For additional information, refer to: Engine Cover - TDV8 3.6L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

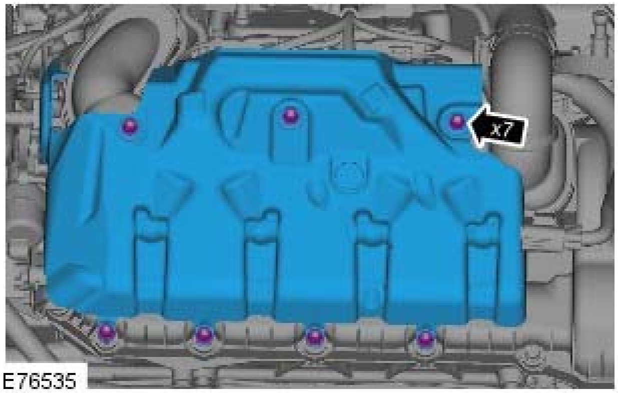
4. Remove the auxiliary battery tray.
For additional information, refer to: Auxiliary Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).



5. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Remove the oil level indicator and upper oil level indicator tube.

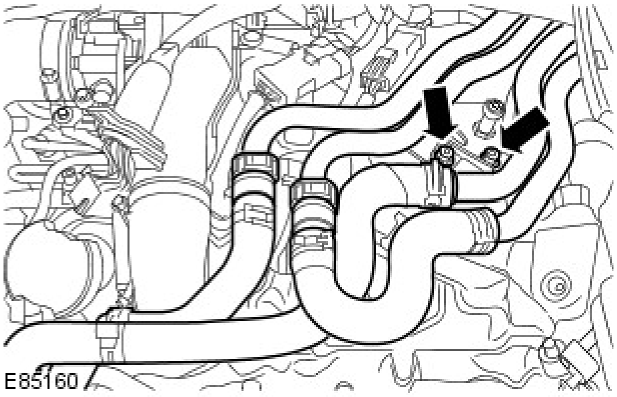
- Remove the bolt.
- Remove and discard the 2 O-ring seals.



6. Remove the RH fuel line shield.

- Remove the 7 nuts.

7. Remove the battery tray.
For additional information, refer to: Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).

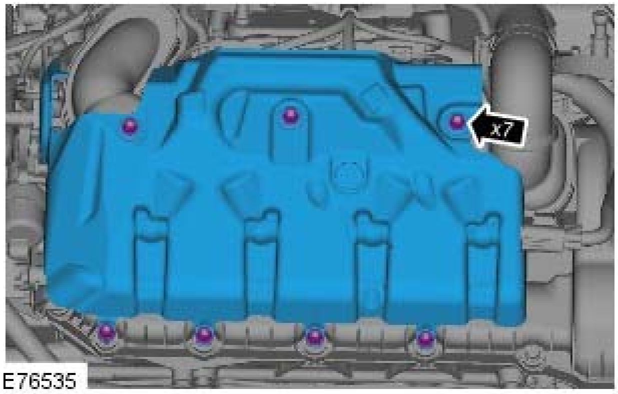


8. Release the coolant lines.

- Remove the 2 nuts.

9. Remove the oil filler cap.

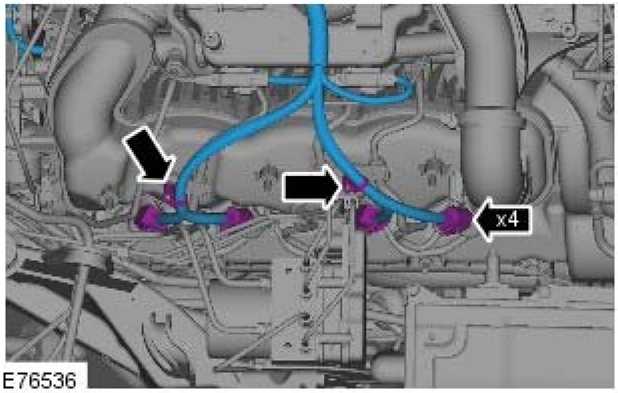
- Remove and discard the O-ring seal.



10. NOTE: RH illustration shown, LH is similar

Remove the LH fuel line shield.

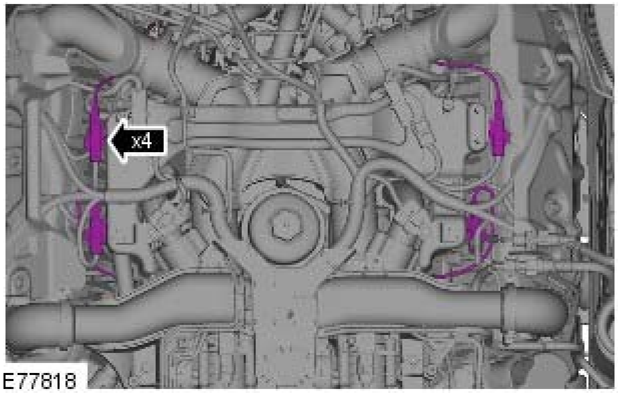
- Remove the 7 nuts.



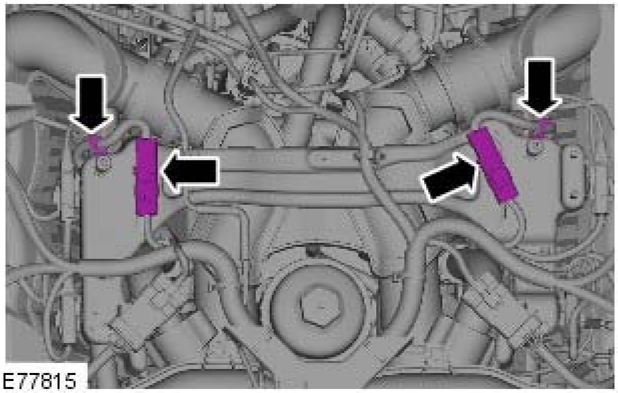
11. NOTE: RH illustration shown, LH is similar

Disconnect the 8 fuel injector electrical connectors.

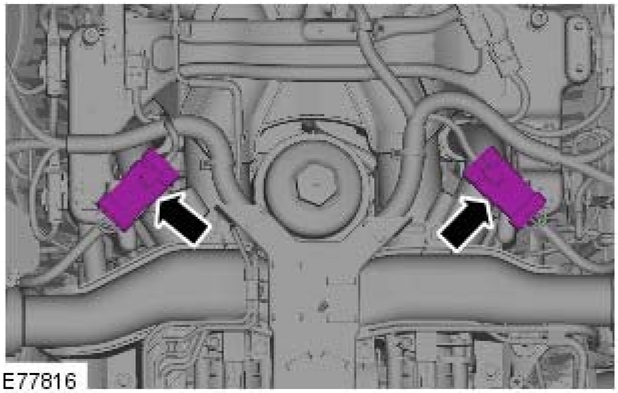
- Release the 4 wiring harness clips.



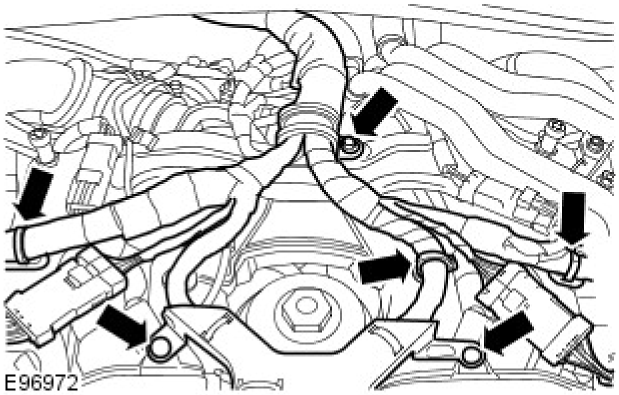
12. Disconnect the 4 knock sensor (KS) electrical connectors.



13. Disconnect both glow plug electrical connectors.



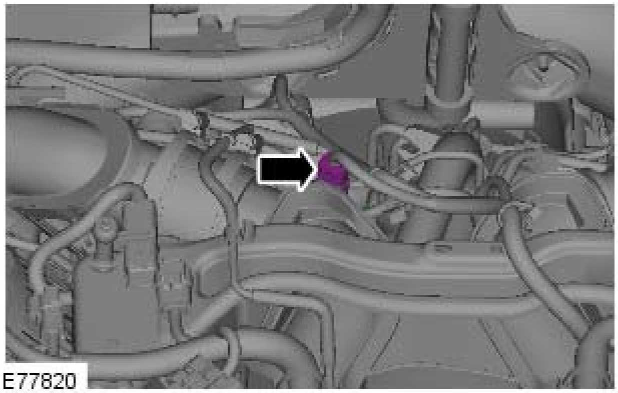
14. Disconnect both exhaust gas recirculation (EGR) valve electrical connectors.



15. Release the wiring harness.

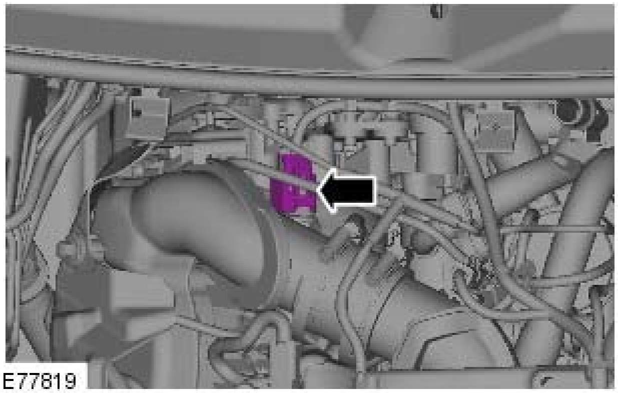
- Release the 5 clips.
- Remove the bolt.

16. Disconnect the fuel temperature sensor electrical connector.



E77820

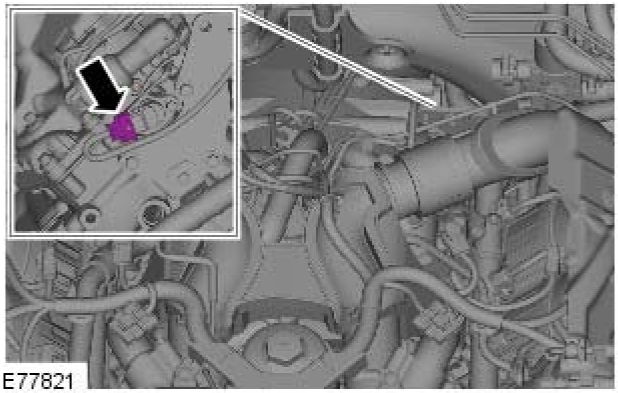
17. Disconnect the fuel rail pressure (FRP) sensor electrical connector.



E77819

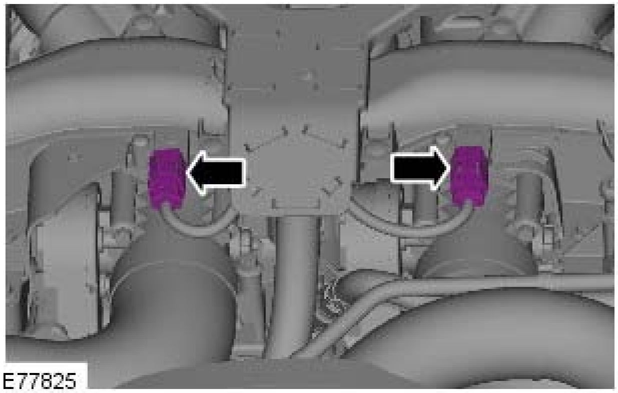
18. Disconnect the camshaft position (CMP) sensor electrical connector.

- Release the 3 wiring harness clips.



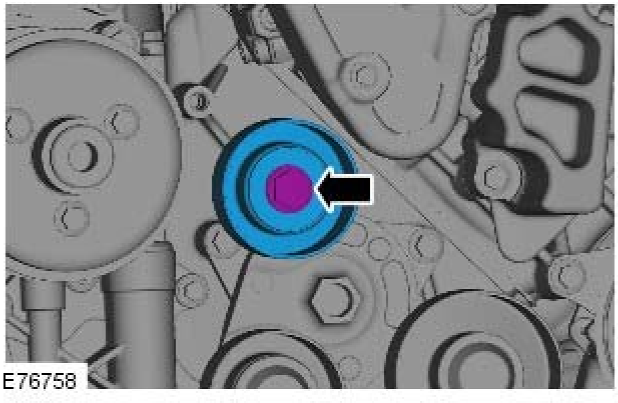
E77821

19. Disconnect both manifold absolute pressure and temperature (MAPT) sensor electrical connectors.



E77825

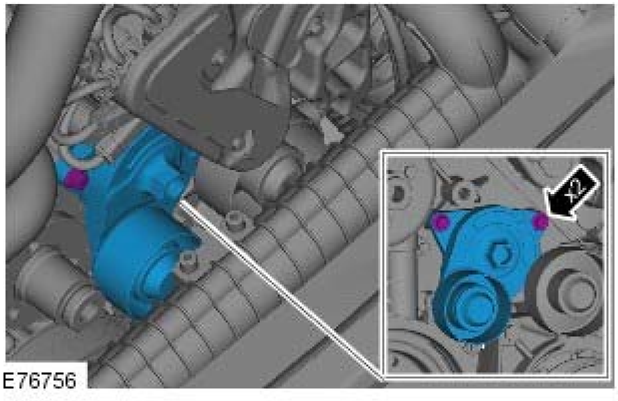
20. Remove the generator.
For additional information, refer to: Generator (414-02D Generator and Regulator - TDV8 3.6L Diesel, Removal and Installation).



21. NOTE: The bolt and spacer will remain captive to the accessory drive belt idler pulley.

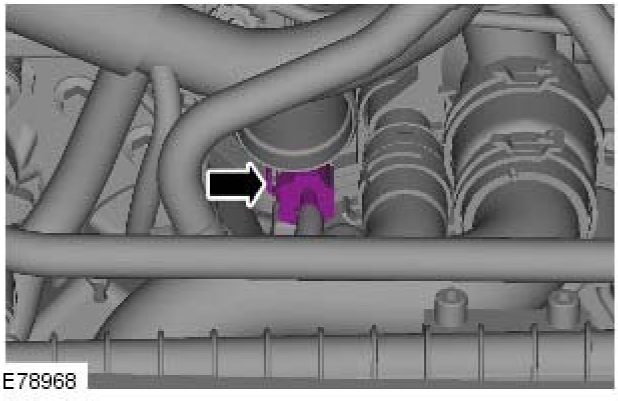
Remove the cooling fan belt idler pulley.

- Remove and discard the access cover.
- Fully loosen the bolt.



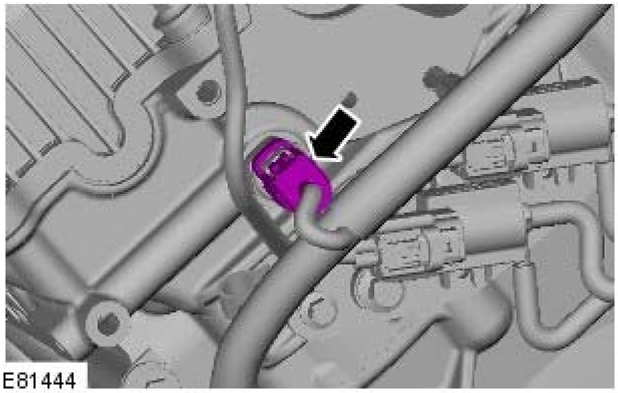
22. Remove the cooling fan belt tensioner.

- Remove the 2 bolts.

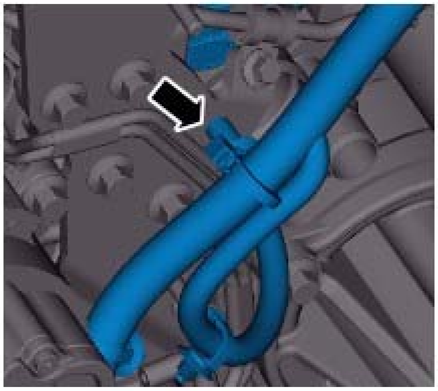


23. Disconnect the engine coolant temperature (ECT) sensor electrical connector.

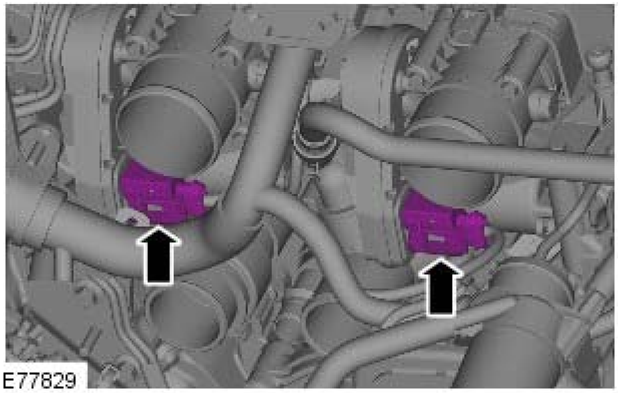
24. Disconnect the engine oil pressure (EOP) sensor electrical connector.



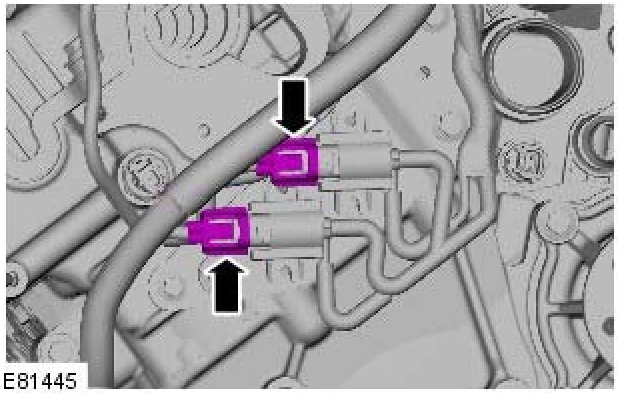
25. Release the wiring harness.



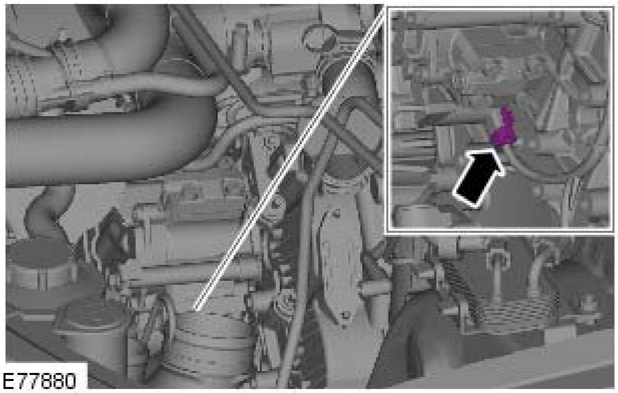
26. Disconnect both throttle body electrical connectors.



27. Disconnect both vacuum solenoid electrical connectors.

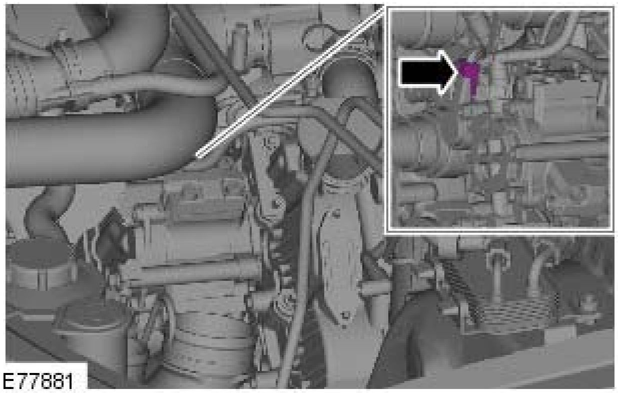


28. Disconnect the fuel metering valve electrical connector.



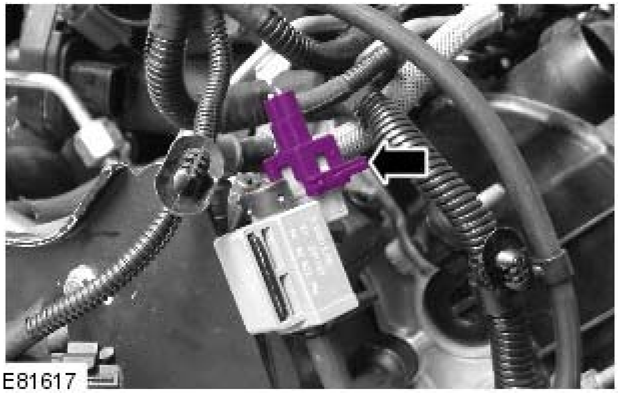
E77880

29. Disconnect the fuel injection control pressure sensor electrical connector.



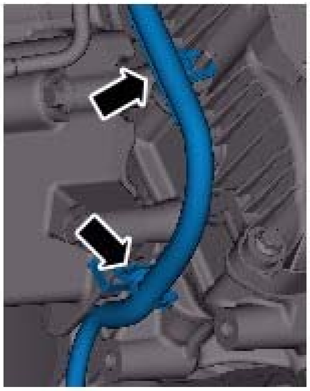
E77881

30. Disconnect the air suspension solenoid electrical connector.



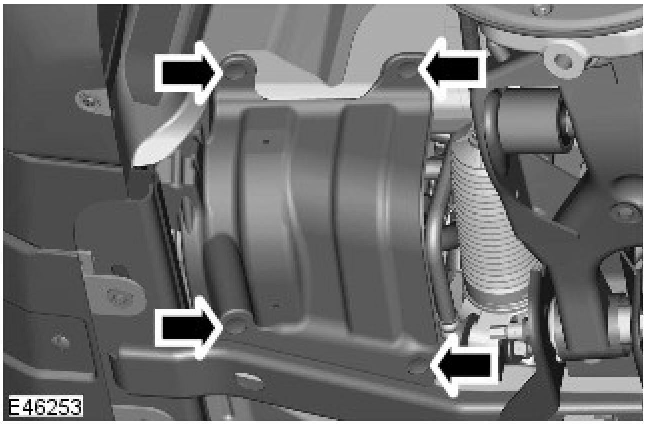
E81617

31. Release the wiring harness.



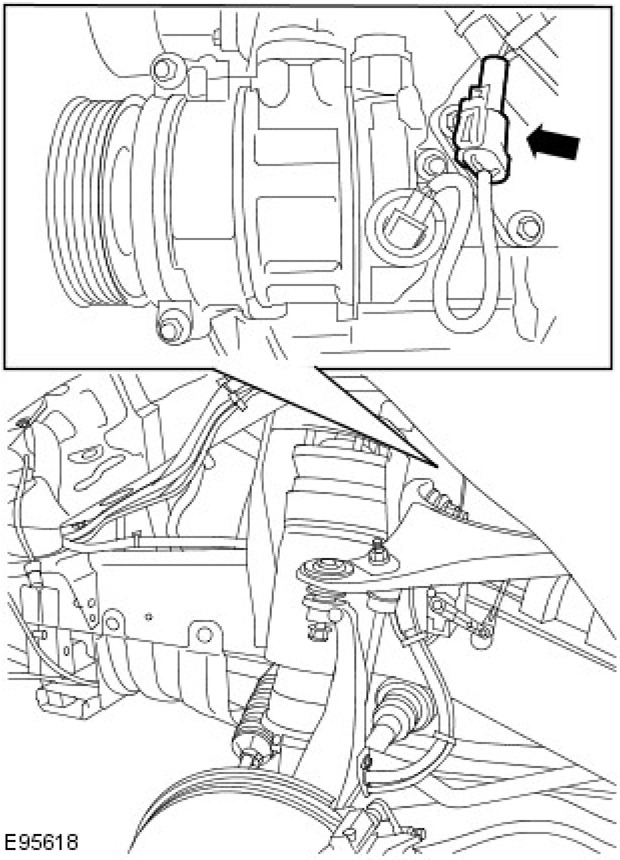
E95297

32. Remove the LH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).



33. Remove the front LH splash shield.

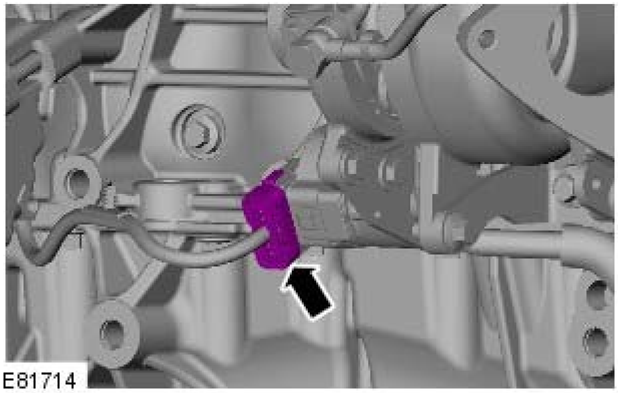
- Remove the 4 clips.



34. Disconnect the air conditioning (A/C) compressor electrical connector.

- Release the A/C compressor electrical connector from the bracket.

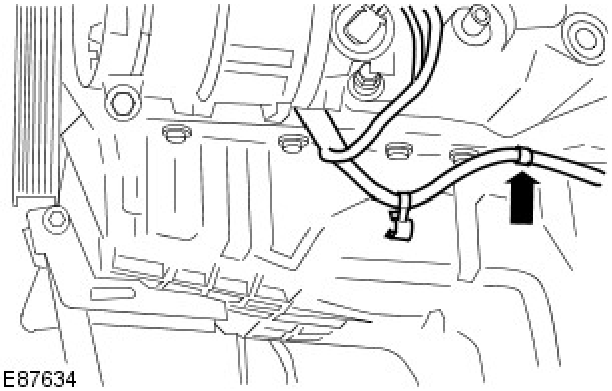
35. Disconnect the LH turbocharger electrical connector.



E81714

36. NOTE: RH illustration shown, LH is similar

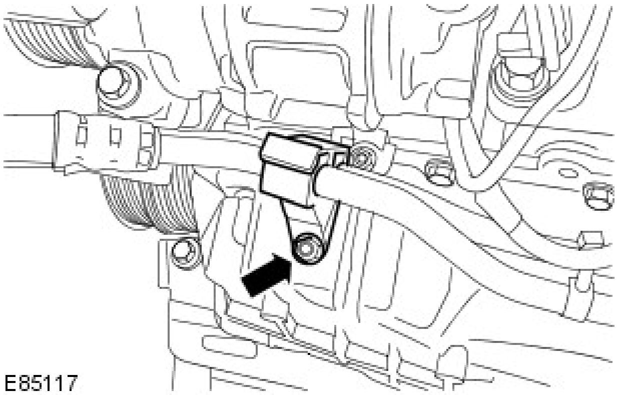
Release the wiring harness from the oil pan.



E87634

37. Release the transmission cooler line support bracket.

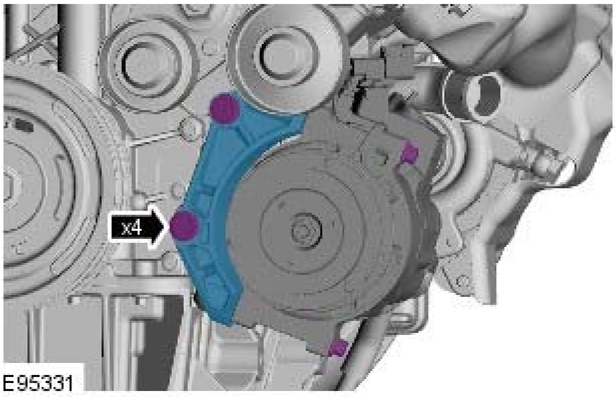
- Remove the nut.



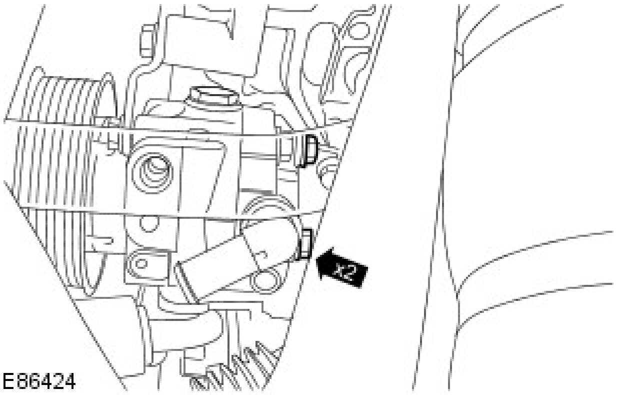
E85117

38. Remove the A/C support bracket.

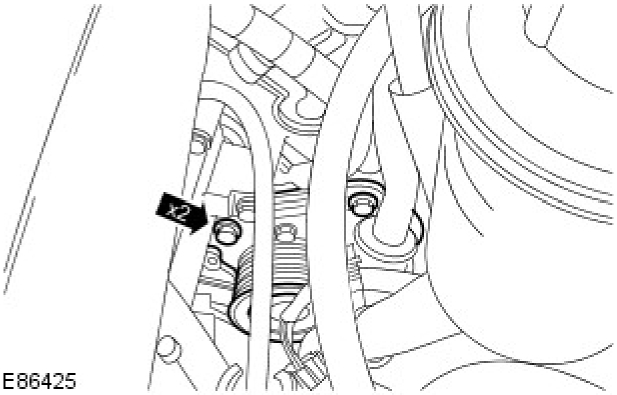
- Remove the 4 bolts.



E95331

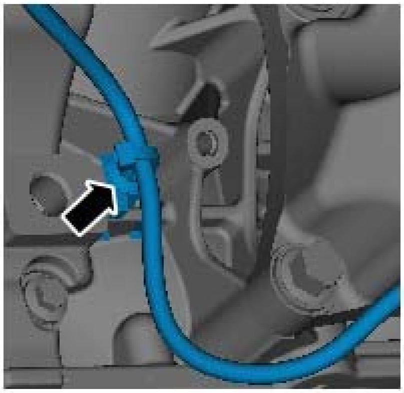


39. Remove the 2 power steering pump rear bolts.



40. Release the power steering pump.

- Remove the power steering pump 2 front bolts.



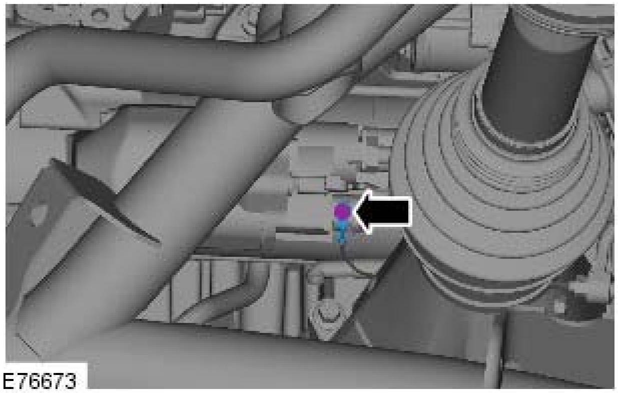
41. Release and reposition the wiring harness.

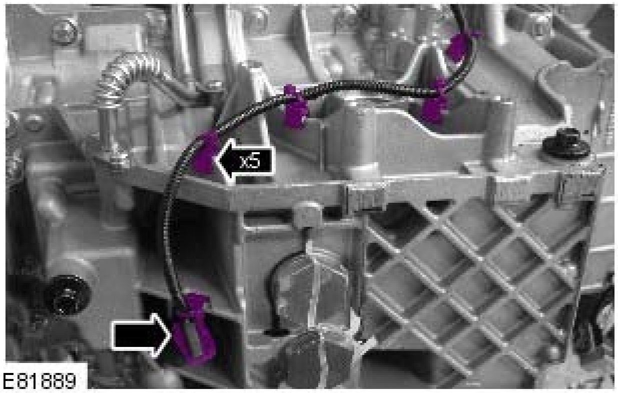
- Release the wiring harness clip.

42. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

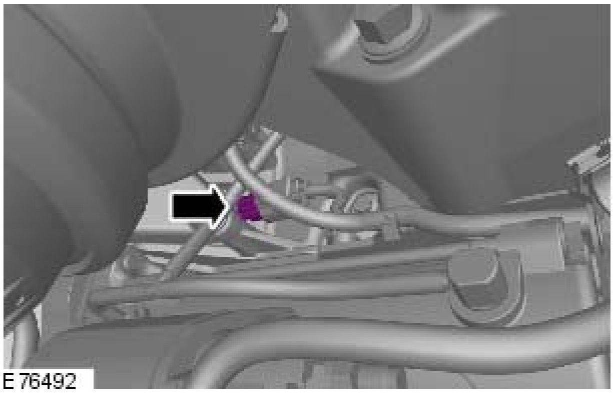
43. Disconnect the switch lead from the starter motor solenoid.

- Remove the bolt.

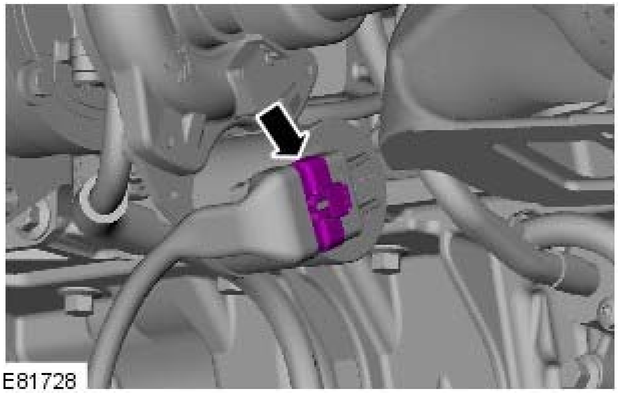




44. Disconnect the engine oil temperature sensor electrical connector.



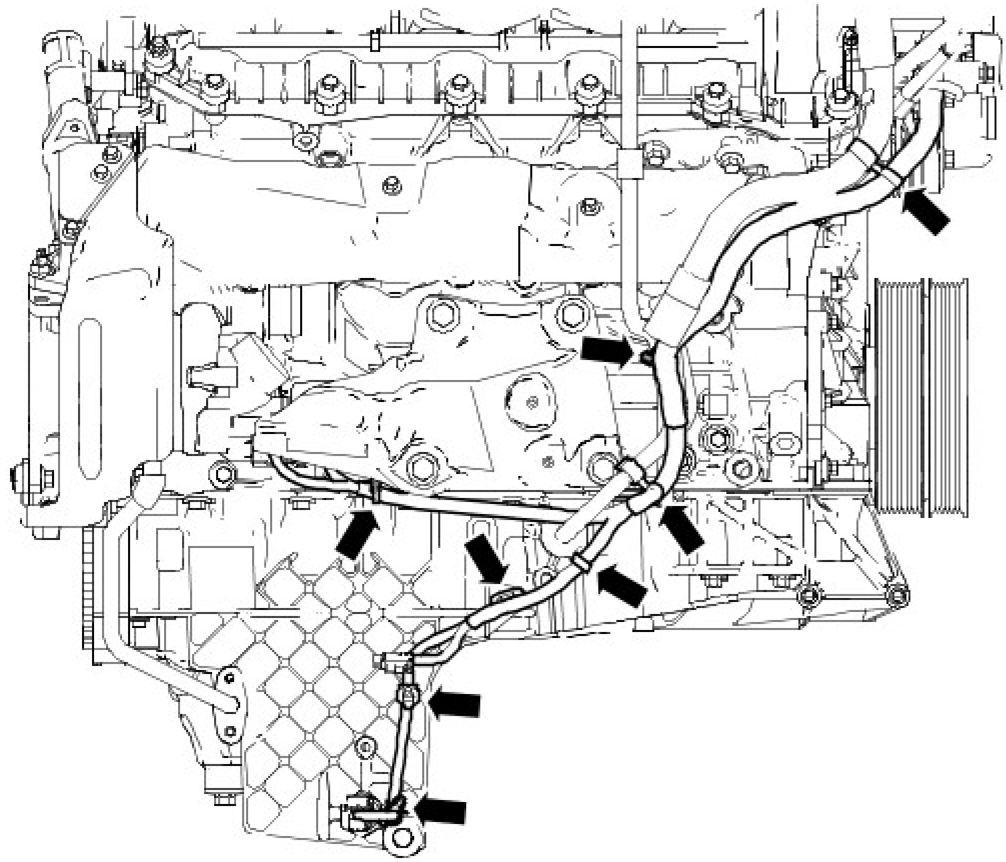
45. Disconnect the crankshaft position (CKP) sensor electrical connector.



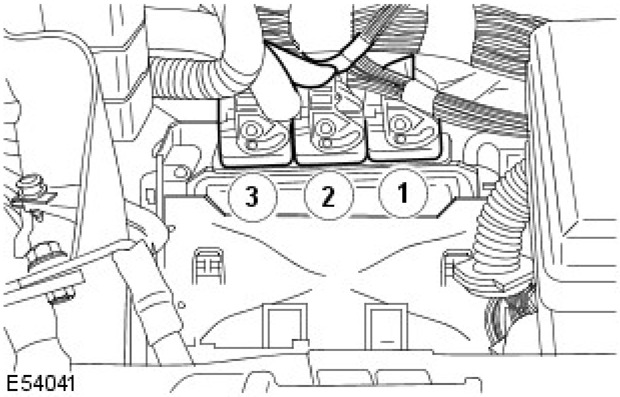
46. Disconnect the RH turbocharger electrical connector.

47. Release and reposition the wiring harness.

- Release the 8 clips.

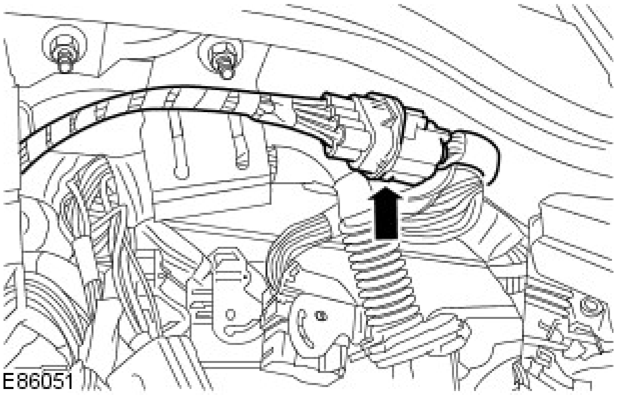


E95594



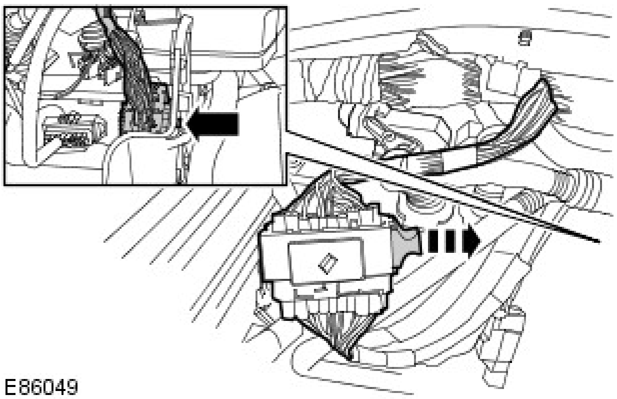
E54041

48. Disconnect the 3 electrical connectors from the engine control module (ECM).



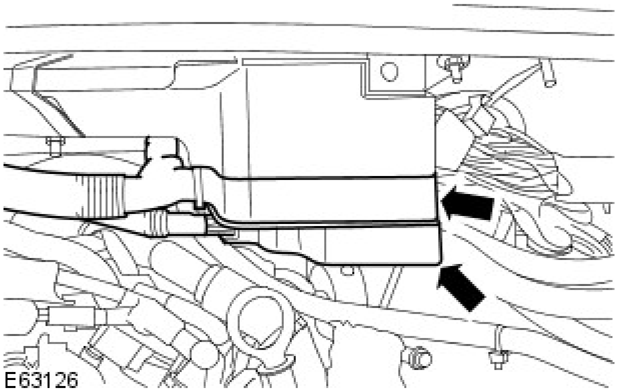
E86051

49. Disconnect the glow plug electrical connector.



E86049

50. Disconnect the engine wiring harness electrical connector.



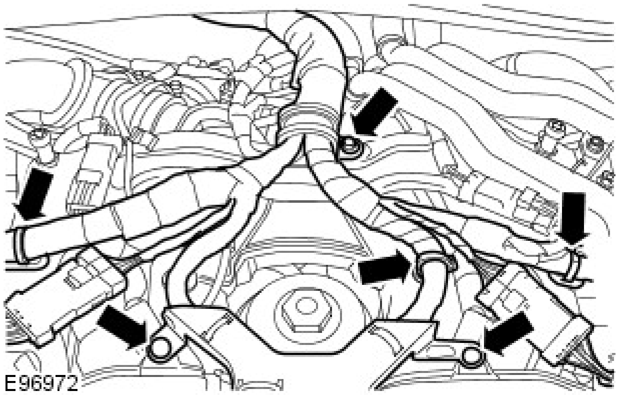
E63126

51. Release the engine wiring harness cassette and reposition the wiring harness.

- Release the 2 clips.

52. Remove the engine wiring harness.

Installation



E96972

1. Install the engine wiring harness.

- Tighten the bolt to 10 Nm (7 lb.ft).
- Secure with the clips.

2. Reposition the engine wiring harness and secure the wiring harness cassette.

- Secure the clips.

3. Connect the engine wiring harness electrical connector.

4. Connect the glow plug electrical connector.

5. Connect the ECM electrical connectors.

6. Reposition and secure the wiring harness.

- Secure the clips.

7. Connect the RH turbocharger electrical connector.

8. Connect the CKP sensor electrical connector.

9. Connect the engine oil temperature sensor electrical connector.

10. Connect the switch lead to the starter motor solenoid.

- Tighten the bolt to 4 Nm (3 lb.ft).

11. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

12. Reposition and secure the wiring harness.

- Secure the clip.

13. Secure the power steering pump.

- Tighten the bolts to 23 Nm (17 lb.ft).

14. Install the A/C compressor support bracket.

- Tighten the M10 to 45 Nm (33 lb.ft).
- Tighten the M8 to 23 Nm (17 lb.ft).

15. Secure the transmission cooler line support bracket.

- Tighten the bolt to 10 Nm (7 lb.ft).

16. Secure the wiring harness.

17. Connect the LH turbocharger electrical connector.

18. Connect the A/C compressor electrical connector.

- Secure the A/C compressor electrical connector to the bracket.

19. Install the front LH splash shield.

- Install the clips.

20. Install the front LH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

21. Secure the wiring harness.

22. Connect the air suspension solenoid electrical connector.

23. Connect the fuel injection control pressure sensor electrical connector.

24. Connect the fuel metering valve electrical connector.

25. Connect the vacuum solenoid electrical connectors.

26. Connect the throttle body electrical connectors.

27. Secure the wiring harness.

28. Connect the EOP sensor electrical connector.

29. Connect the ECT sensor electrical connector.

30. Install the cooling fan belt tensioner.

- Tighten the bolts to 25 Nm (18 lb.ft).

31. Install the cooling fan belt idler pulley.

- Tighten the bolt to 48 Nm (35 lb.ft).
- Install a new access cover.

32. Install the generator.
For additional information, refer to: Generator (414-02D Generator and Regulator - TDV8 3.6L Diesel, Removal and

Installation).

33. Connect both MAPT sensor electrical connectors.

34. Connect the CMP sensor electrical connector.

- Secure the wiring harness clips.

35. Connect the FRP sensor electrical connector.

36. Connect the fuel temperature sensor electrical connector.

37. Secure the wiring harness.

38. Connect both EGR valve electrical connectors.

39. Connect the glow plug electrical connectors.

40. Connect the KS electrical connectors.

41. Connect the fuel injector electrical connectors.

- Secure the wiring harness clips.

42. Install the LH fuel line shield.

- Tighten the nuts to 5 Nm (4 lb.ft).

43. Install the oil filler cap.

- Install a new O-ring seal.

44. Secure the coolant lines.

- Tighten the bolt to 10 Nm (7 lb.ft).
- Tighten the nuts 10 Nm (7 lb.ft).

45. Install the battery tray.
For additional information, refer to: Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).

46. Install the RH fuel line shield.

- Tighten the nuts to 5 Nm (4 lb.ft).

47. NOTE: Remove and discard the blanking caps.

Install the oil level indicator and upper oil level indicator tube.

- Clean the components mating faces.
- Install new O-ring seals.
- Tighten the bolt.

48. Install the auxiliary battery tray.
For additional information, refer to: Auxiliary Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).

49. Install the engine cover.
For additional information, refer to: Engine Cover - TDV8 3.6L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

50. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Wiring Harnesses - Wiring Harness

Description and Operation

Introduction

⚠CAUTION: Do **not** use any other heat shrink sleeve other than the approved glue lined heat shrink sleeve mentioned in the repair procedure.

The purpose of this document is to promote quick and efficient minor repair to harness connectors or cables using approved methods and the wiring harness repair kit. Repairs may only be made to cables and connectors which have been mechanically, **not electrically** damaged. It also applies where the whole extent of the damage can be clearly identified and rectified.

Care and neatness are essential requirements in making a perfect repair.

Caution:

At the time of this first issue of the Harness Repair Guide, do not approve repairs to any of the following circuits:

- Any media orientated system transport network harnesses.
- Supplement restraint system (SRS) firing circuits (Air bags).
- Link lead assembles, which are unique to safety critical circuits such as anti-lock brake system (ABS) and thermocouple circuits. An example of this is the ABS wheel speed sensors with moulded connectors.
- 4. Screened cables, leads and wiring harness(s).

If any harness(s) with defective electrical connector terminals or wires from the above circuits are a concern, new components must be installed.

Repair Kit

⚠CAUTION: Where the repair procedure indicates that a glue lined heat shrink sleeve should be applied, apply sufficient heat to the glue lined heat shrink to melt the glue in order to provide a water tight seal. Do **not** over heat the glue lined heat shrink sleeve so that the wiring harness insulation becomes damaged.

The wiring harness repair kit has been produced which comprises:

- Pre-terminated wiring harness(s) of different sizes and types
- Three sizes of butt splice connectors
- A selection of colored cable identification sleeves
- Two sizes of glue lined heat shrink sleeves
- Crimping pliers
- A wire cutter and insulation stripper
- An electrical connector terminal extraction handle and tips

A suitable heat source, for shrinking heat shrink sleeves will be required.

The pre-insulated diamond grip range of electrical connector terminals and in-line, butt splice connectors contained within the wiring harness repair kit are the **only** acceptable product for the repairs of wiring harnesses. The butt connectors not only grip the wire but also the insulation, making a very secure joint.

If an electrical connector terminal is not included in the wiring harness repair kit then approval for the repair is **NOT** given and in these circumstances a new wiring harness must be installed.

Pre-Terminated Wiring Harness(s) and Butt Splice Connectors

All pre-terminated wiring harness(s) and butt splice connectors in the wiring harness repair kit are contained in bags which can be resealed after use. Each bag is marked with the part number of the items stored within the bag. Each storage compartment in the wiring harness repair kit is identified with the corresponding part number. Make sure that pre-terminated wiring harness(s) and connectors are not mixed up it is advisable to only open one bag at a time and to reseal the bag securely before opening another bag. Also, replace the bag in its mating part number compartment within the case.

The pre-terminated wiring harness(s) are supplied with the insulation in one of three colors, red, blue or yellow. The colors do not apply to any particular circuit but to the harness wire size. See the Relationship Table in the Repair Method section.

Butt splice connectors are also supplied with red, blue or yellow coverings, which must be matched to the pre-terminated wiring harness insulation color.

The illustration shows:

- The pre-terminated wiring harness(s) which are included in the wiring harness repair kit
- The part number of the pre-terminated wiring harness
- The letter showing the extractor tip which must be used to remove this type of electrical connector terminal
- Those electrical connector terminals which are gold

Some of the pre-terminated wiring harness(s) have seals installed to the insulation for sealed connector applications. It is essential for prevention of moisture ingress that a sealed pre-terminated wiring harness must be used where a sealed terminal was removed.

⚠ CAUTION: Where the repair procedure indicates that a glue lined heat shrink sleeve should be applied, apply sufficient heat to the glue lined heat shrink to melt the glue in order to provide a water tight seal. Do **not** over heat the glue lined heat shrink sleeve so that the wiring harness insulation becomes damaged.

Two sizes of heat shrink sleeving are supplied in the wiring harness repair kit. Each heat shrink sleeve contains a sealant glue. These must be used when connecting wiring harness(s) or electrical connector terminal(s) at all times. The smaller diameter heat shrink sleeve is to be used with the red and blue butt splice connectors and the larger diameter sleeve with the yellow butt splice connectors.

For ease and speed, some of the pre-terminated wiring harness(s) may already have the insulation partly stripped at the splice end. If the repair requires insulation to be stripped from the cable, refer to the Relationship Table for the correct length of insulation to be stripped.

The Pre-Terminated Wiring Harness(s) illustration shows the electrical connector terminal type, the part number of the pre-terminated wiring harness and the letter of the extractor tip which must be used to extract the electrical connector terminal from the connector housing. Additionally, those electrical connector terminal(s) which are gold are identified, all others are therefore, tinned and not gold.

Wiring Harness Cable Identification Sleeves

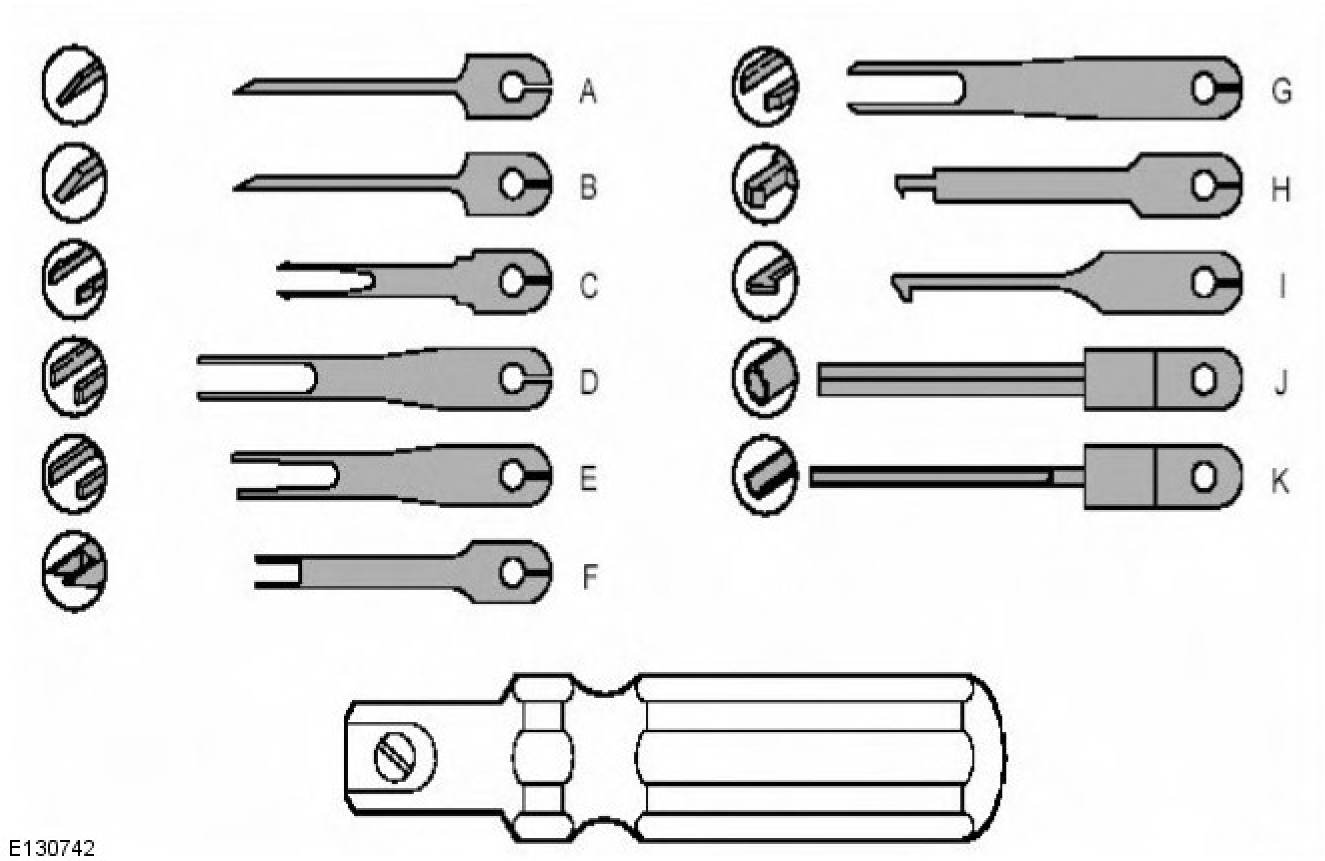
A selection of colored sleeves are contained in the wiring harness repair kit for maintaining the wiring harness cable identification on the pre-terminated wiring harness. Place the correct colored sleeve(s) over the pre-terminated wiring harness insulation as near to the electrical connector as possible with the main wiring harness cable color nearest to the electrical connector.

For example, if the original wiring harness cable color is pink with a black trace put the pink wiring harness cable identification sleeve on the pre-terminated wiring harness first followed by a black sleeve, and slide both along the wiring harness cable to the electrical connector terminal.

Extraction Handle and Tips

The extraction handle, in conjunction with the correct tip, is used to remove a terminal from an electrical connector. Each tip contained in the wiring harness repair kit is marked with an identification letter, A to K inclusive. Each tip has been specially designed to extract a particular type of electrical connector terminal. The use of any other tool is **not** recommended and is liable to cause damage to the electrical connector. The tip is fastened to the handle by a screw which holds the tip firmly yet allows it to be easily replaced.

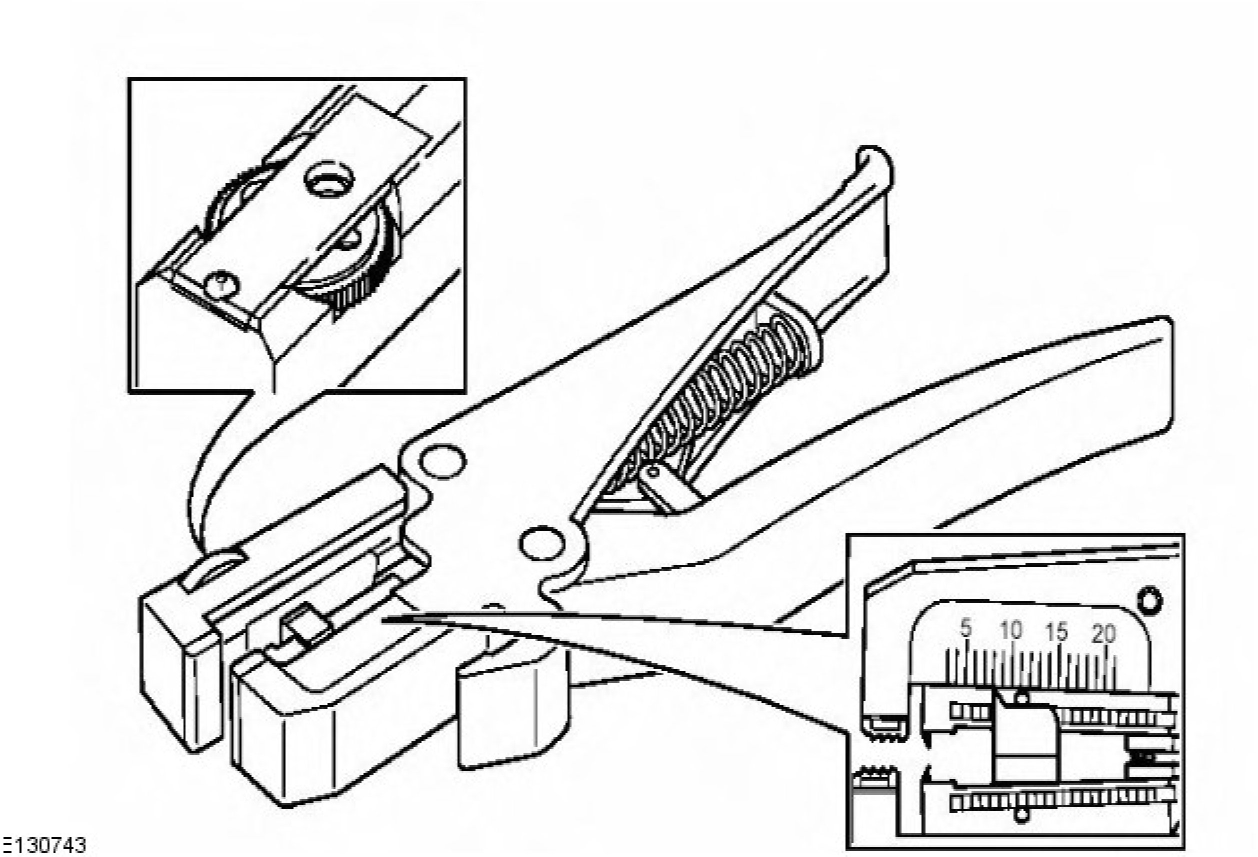
Extraction Handle and Tips



Insulation Stripper

The moving jaw has an adjuster wheel which has a series of holes in it. Turning the wheel and placing the cable in the matching size hole will automatically adjust the jaw to the correct pressure. Note that some wiring harness(s) may have a harder insulation and slight adjustment of the wheel may be needed to make a clean strip but exercise care not to damage the wire.

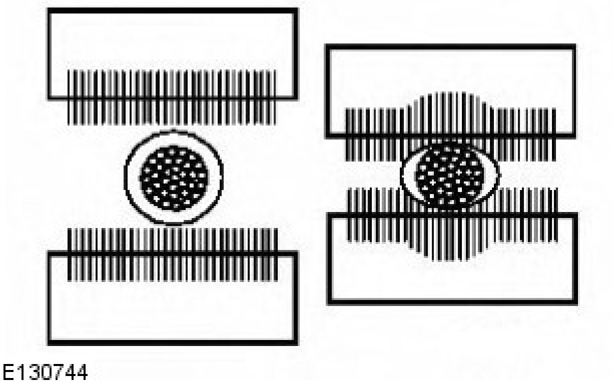
Insulation Stripper



By pressing the outer edges of the wiring harness cable length stop together the adjuster can be slid up or down the jaw. This decreases or increases the length by which the wiring harness cable insulation will be stripped from the pre-terminated wiring harness or wiring harness wire. The adjuster has a position indicator to align with a graduated scale and this sets the correct length in millimetres, of insulation to be stripped. The amount of insulation to be stripped is shown in the Relationship Table.

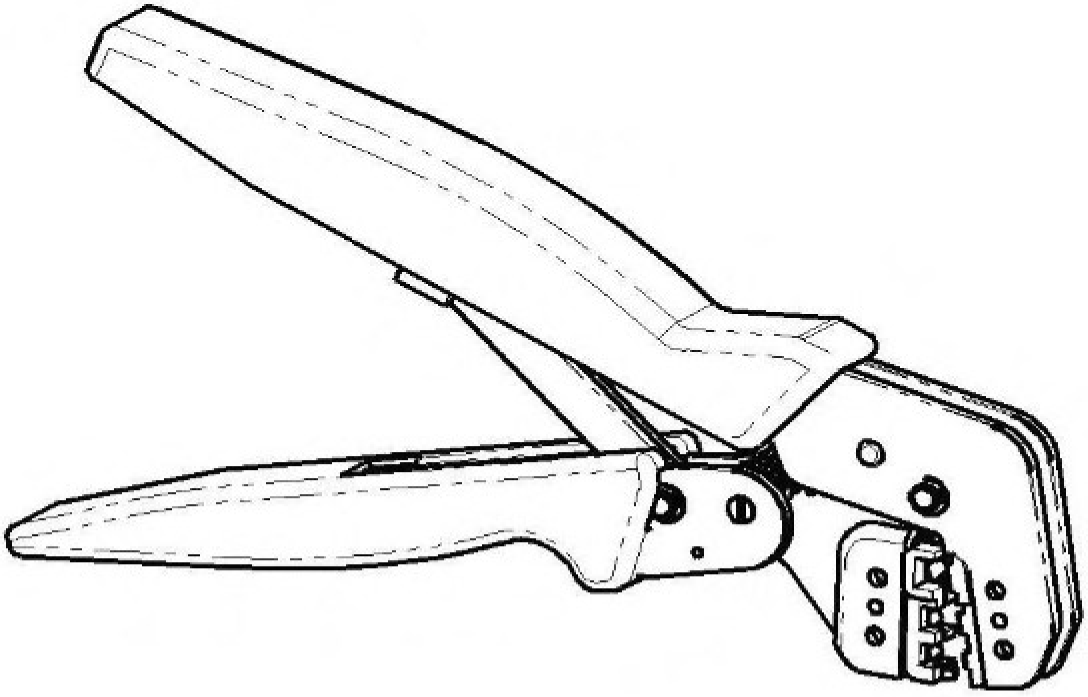
The illustration shows the insulation stripper tool and a wiring harness correctly gripped in the jaws. A wire cutter is provided on the outer side of the fixed jaw.

Cable Correctly Gripped in Stripper Blades



Crimping Pliers

Crimping Pliers



E130745

The crimping pliers have a moving jaw and a stationary jaw, with three different sized crimping enclosures. Each of the enclosures is identified by a red, blue or yellow coloured dot which corresponds to the three colours of the pre-terminated wiring harness(s) and butt splice connector colors.

List of Parts

Description	Part Number	Quantity
Wiring Harness Repair Kit	418-S065	1
Pre-Terminated Wiring Harness(s)	418-066 to 418-103 inclusive	10 each
Glue Lined Heat Shrink Pack – small diameter	418-104	25 per pack
Glue Lined Heat Shrink Pack – larger diameter	418-105	10 per pack
Case Assembly Comprising – carry case, lid, inner lid, base, insert, trays foam spacers	418-106	1
Butt Splice Connector – Red	418-107	50 per pack
Butt Splice Connector – Blue	418-108	50 per pack
Butt Splice Connector – Yellow	418-109	20 per pack
Extraction Tool Handle	418-110	1
Extraction Tip Pack consists of 2 spare screws plus	418-S111	1
Tip A	418-118	1
Tip B	418-119	1
Tip C	418-120	1
Tip D	418-121	1
Tip E	418-122	1
Tip F	418-123	1
Tip G	418-124	1
Tip H	418-125	1
Tip I	418-126	1
Tip J	418-127	1
Tip K	418-128	1
Sleeve Identification Pack – for Red insulation	418-112	500
Sleeve Identification Pack – for Blue insulation	418-113	500
Sleeve Identification Pack – for Yellow insulation	418-114	500
Instruction Manual	JTP 593	1
Crimping Pliers	YRW500010	1

Repair Methods

⚠CAUTION: **Several different types and sizes of terminal may be found in a single electrical connector housing.**

It is necessary to identify:

- The conductor (wire) size of the affected wiring harness
- The electrical connector range from which the damaged wiring harness is to be removed
- The terminal type

Use of the approved diagnostic tool will greatly assist in the quick identification of electrical connectors and faulty pin terminal(s).

Reference can also be made to the vehicle Electrical Guides, held by Dealers, to identify wiring harness(s) and electrical connector(s).

By using the Relationship Table, the wiring harness conductor (wire) size can be related to a suitable pre-terminated wiring harness by the color of the insulation. Also, the correct length of insulation to be stripped from the wiring harness lead is identified.

Relationship Table

CABLE RANGE	SPLICE	STRIP LENGTH
0.35 mm² to 1.50 mm²	RED	6.00 to 7.00 mm
1.00 mm² to 2.50 mm²	BLUE	6.00 to 7.00 mm
4.00 mm² to 6.00 mm²	YELLOW	9.00 to 9.50 mm

Electrical Connector Terminal Extraction

It must be noted that some electrical connector(s) have anti-backout devices which prevent the terminals from being removed from the electrical connector. Some examples of these are shown in following illustrations. The anti-backout device must be released before attempting to remove the terminal from the electrical connector. Some anti-backout devices require a special tip to release the device and these have been included in the kit. Most can be released by carefully using a suitable small screwdriver.

Various types of electrical connector have seals installed internally or externally to prevent moisture ingress. These normally do not have to be removed but make sure that they are installed when the electrical connectors are connected.

The illustrations show examples of each tip used on different types of electrical connector(s). There are a large number of different types of electrical connector used on vehicles therefore only one example using each tip is shown. Technicians experience and judgement will dictate which type of tip should be used for those electrical connector(s) which are not shown. Care should be exercised to avoid further damage when removing the terminals from the electrical connector.

• NOTE: **Examples of the extraction tips and anti-backout tips.**

Repair Procedure

• CAUTIONS:

⚠ Do not use crimping pliers, insulation strippers, butt splice connectors, heat shrink sleeves or pre-terminated wiring harness(s) that are not supplied with the Jaguar wiring harness repair kit. Each part has been designed to be used only with the other parts in this wiring harness repair kit.

⚠ Where the repair procedure indicates that a glue lined heat shrink sleeve should be applied, apply sufficient heat to the glue lined heat shrink to melt the glue in order to provide a water tight seal. Do **not** over heat the glue lined heat shrink sleeve so that the wiring harness insulation becomes damaged.

It is not correct to make more than five repair joints on the wiring harness to any electrical connector and if more damage is found at the same electrical connector then a new wiring harness must be installed.

- Remove the faulty terminal from the electrical connector using the extractor tool and correct tip. Make sure that any anti-backout device is released before trying to remove the terminal.
- ⚠CAUTION: : A number of electrical connector terminals are gold plated or gold flashed. When defective, they must be installed with a gold pre-terminated wiring harness(s) from the wiring harness repair kit. It is not always easy to identify the female as gold but the male pins are visually easier, therefore always check both male and female terminals to identify those which are gold. Under no circumstances are gold and tin terminals to be mixed as this will lead to early failure of the electrical contact.

  • NOTE: Never use a harness lead with a smaller diameter than the original harness lead.

  Select the correct size and type of pre-terminated wiring harness and butt splice connector from the wiring harness repair kit.
- Using the wire cutter on the stripping tool, cut the pre-terminated wiring harness and the harness cable to the required length.
- • NOTE: See illustration: **Stripping Insulation**

  From the Relationship Table, find the correct length of insulation to be stripped from the pre-terminated wiring harness and set the adjustable cable length stop to the correct length. Place the pre-terminated wiring harness in the wire stripper and remove the insulation.
- Put the cable identification sleeve(s) on to the wiring harness with the main cable colour nearest to the terminal.
- During this next step do not overtighten. Place the selected butt splice connector in the crimping tool, matching the aperture and the butt connector colours. Make sure that the window indentation in the butt connector is resting over the guide bar on the lower jaw. Partially close the grip until the butt connector is securely held in the aperture. This will give support to the butt connector while the pre-terminated wiring harness is inserted into it.
- • NOTE: See illustration: **Spice Correctly Located**

  Insert the pre-terminated wiring harness into the butt connector and make sure that the wire is against the wire stop. Close the grip firmly, crimping the lead to the butt connector. When the handles have been completely closed the butt connector will be freed from the tool as the handles are released. If the handles have not been completely closed then the jaws will hold the butt connector and it cannot be removed from the tool until the crimp is fully made by closing the handles completely.
- Make sure that the harness cable has been squarely cut and the correct length of insulation removed. If more than one splice is needed the butt connectors must be not be crimped to the wiring harness at the same distance from the connector. The splices must be staggered to prevent a bulk of splices in the same area of the wiring harness.
- It is preferable to cover the butt splice joint with heat shrink sleeve. This is desirable not essential, except where the electrical connector is a sealed electrical connector. Use the smaller diameter sleeve for red and blue pre-terminated wiring harness(s) and the large diameter sleeve for the yellow pre-terminated wiring harness(s). It is advisable to place the heat shrink over the completed joint but in some instances the sleeve will not pass over the terminal. Check, and if required, place the correct size sleeve onto the harness cable or pre-terminated wiring harness before crimping the butt splice to the wiring harness.
- Place the harness cable into the butt splice with the splice window over the guide bar. Make sure that the cable harness wire is against the stop in the butt splice, crimp the butt splice connector to the wiring harness.
- Gently pull the harness cables each side of the butt splice to make sure that a secure joint has been made.
- ⚠WARNING: Do not use a naked flame in areas where fuel or oil have been spilt. Clean the area of residual oil and fuel and wait until the fuel spill has fully evaporated.

  • CAUTIONS:

  ⚠ When using a heat source make sure that it is localised and causes no damage to surrounding materials.

Where the repair procedure indicates that a glue lined heat shrink sleeve should be applied, apply sufficient heat to the glue lined heat shrink to melt the glue in order to provide a water tight seal. Do **not** over heat the glue lined heat shrink sleeve so that the wiring harness insulation becomes damaged.

Using a suitable heat source, shrink the sleeve over the butt splice.

- If further pre-terminated wiring harness(s) are to be installed to the same electrical connector, make sure that the lead is cut at a different length to the previous joint. This makes sure that the splices will, where possible, be staggered on the wiring harness and prevent a bulk of splices in one area.
- When all of the splices have been made, fit the terminal(s) to the electrical connector, taking care that the terminals are correctly orientated.
- Install the wiring harness cover and secure with adhesive electrical tape. Do not cover the wiring harness right to the electrical connector as the terminals must have a little movement and not be firmly bound to the electrical connector or wiring harness. Make sure that the cable identification sleeve(s) are showing at the wiring harness electrical connector.

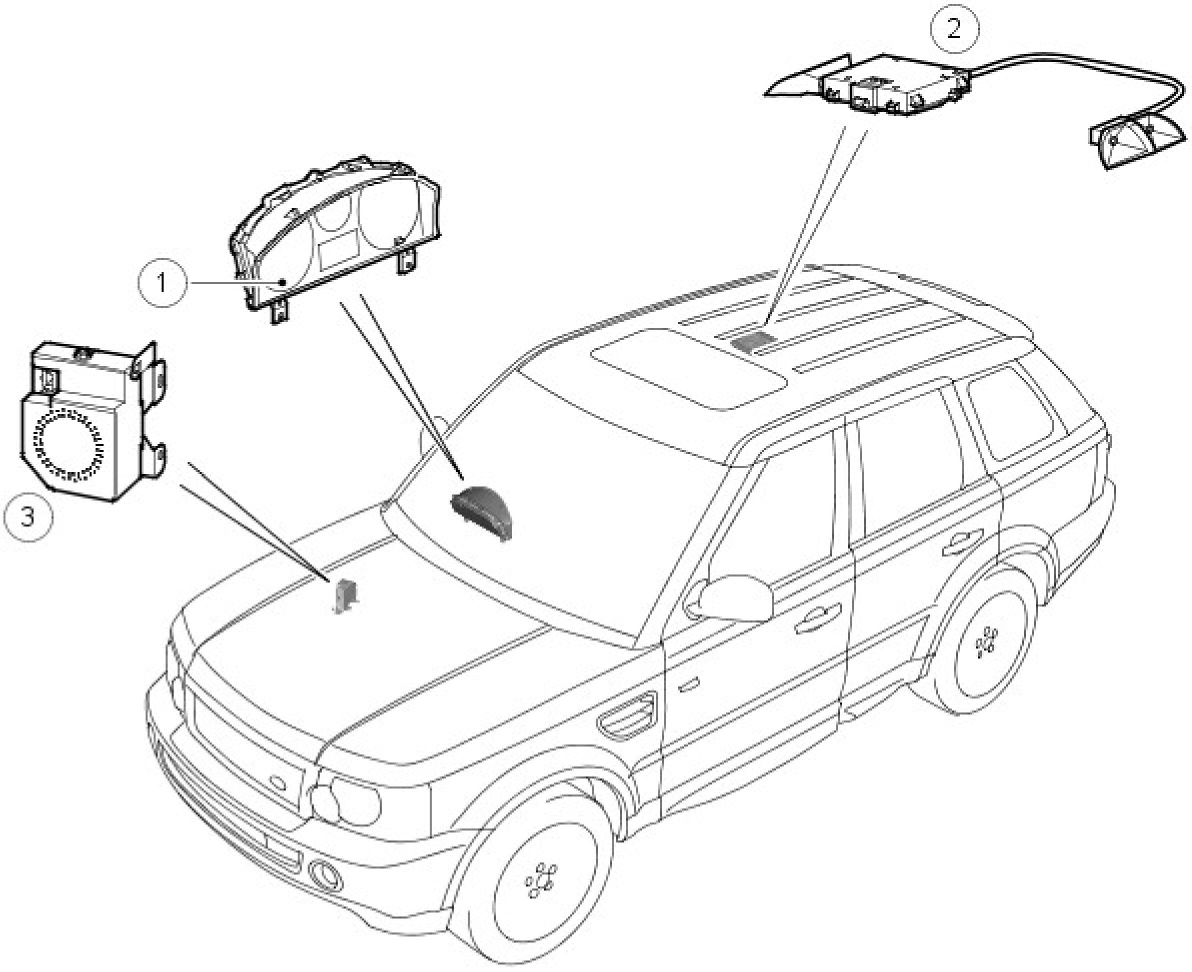
COMPONENT LOCATIONS

- NOTE: right-hand drive (RHD) model shown, left-hand drive (LHD) model similar



E55865

Item	Part Number	Description
1	-	Alarm indicator
2	-	Volumetric sensor
3	-	BBUS (battery backed-up sounder)

GENERAL

The active anti-theft system monitors the hinged panels for unauthorized opening. On some vehicles, the active anti-theft system also incorporates interior monitoring and vehicle tilt sensing functions.

Operation of the active anti-theft system is controlled by the central junction box (CJB). When an alarm is triggered, the CJB sounds the vehicle horns or the BBUS and illuminates the hazard flashers.

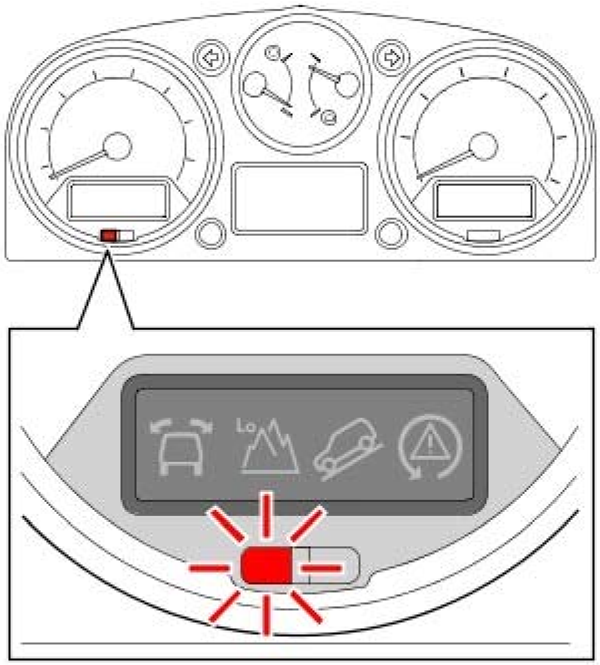
The active anti-theft system consists of:

- An alarm indicator.
- A BBUS (market dependant).
- A volumetric sensor (market dependant).

The active anti-theft system also uses:

- The CJB.
- The hood, door and tailgate ajar switches.
  For additional information, refer to: Handles, Locks, Latches and Entry Systems (501-14 Handles, Locks, Latches and Entry Systems, Description and Operation).
- The vehicle horns.
  For additional information, refer to: Horn (413-06 Horn, Description and Operation).

ALARM INDICATOR



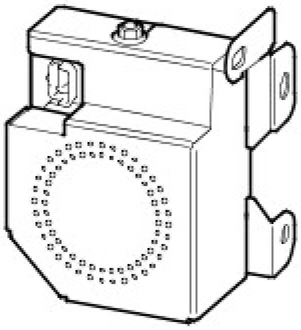
E44259

The alarm indicator is a red light emitting diode (LED) installed in the instrument cluster to provide a visual indication of the active anti-theft system status. Operation of the alarm indicator is controlled by the CJB, which varies the flash rate to indicate the active anti-theft system status.

Active Anti-theft System Status Indications

Status	Description	Alarm Indicator
0 - Disarmed	When system disarmed. Also first 10 seconds after being armed with a panel open.	Off.
1 - Armed	Entered 10 seconds after arming.	10 milliseconds flash every 2 seconds.
2 - Perimeter Arming	All panels closed. Indication delayed for 2.5 seconds to allow time to process double locking commands.	Two 10 milliseconds flashes every 2 seconds, for 10 seconds.
3 - Volumetric Arming	All panels closed and volumetric sensor armed. Indication delayed for 2.5 seconds to allow time to process double locking commands.	Three 10 milliseconds flashes every 2 seconds, for 10 seconds.

BBUS (WHERE FITTED)



E44260

The BBUS is attached to the plenum in the engine compartment, next to the brake booster. The BBUS uses an integral sounder to produce the audio warning after an alarm has been triggered. In some markets, a tilt sensor is incorporated into the BBUS. Externally, the two types of BBUS look the same.

Operation of the BBUS is controlled by the CJB. The CJB and the BBUS exchange signals over a LIN (local interconnect network) bus communications link. The BBUS is normally powered by a permanent battery power supply from the CJB. An integral rechargeable battery powers the sounder if the power feed is disrupted.

When it arms the active anti-theft system, in the perimeter mode or the volumetric mode, the CJB sends an arming signal to the sounder in the BBUS. When it arms the active anti-theft system in the volumetric mode, if a tilt sensor is fitted, the CJB also sends an arming signal to the tilt sensor. On receipt of the arming signals, the sounder and the tilt sensor respond with a status signal. If there is no response to the arming signals within 12 seconds, the CJB assumes there is a fault and sends a disarm signal to the sounder or the tilt sensor, as appropriate. The CJB also stores a related fault code.

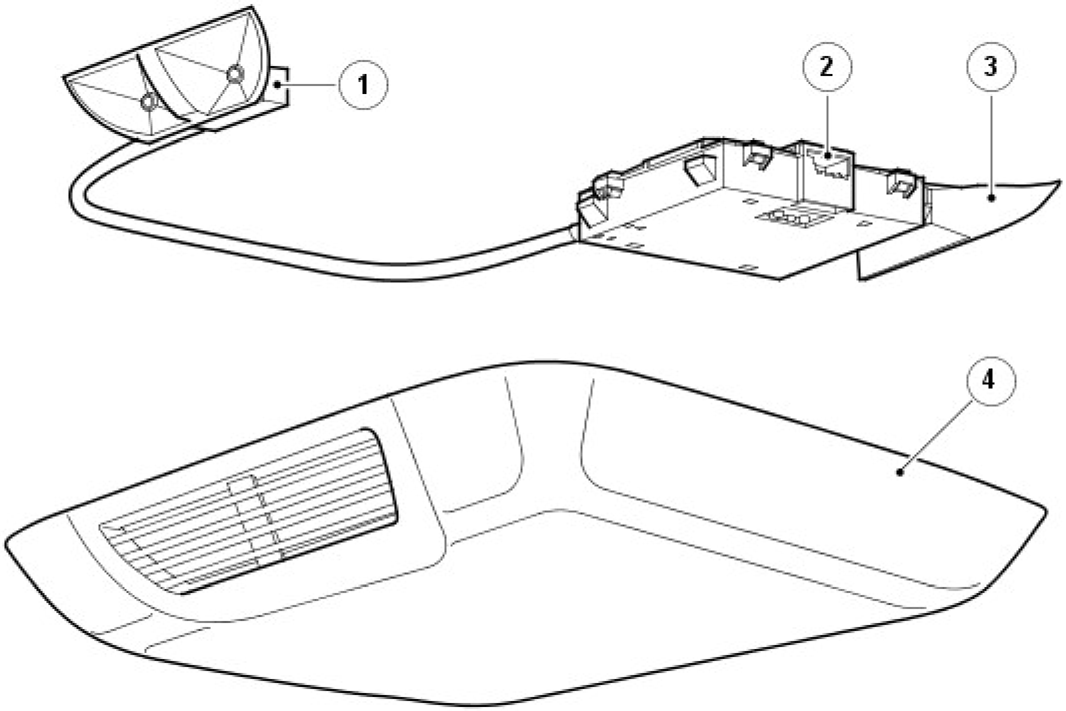
When the sounder is disarmed, while the active anti-theft system is armed, if the alarm is subsequently triggered the CJB uses the horns to sound the audio warning instead of the sounder.

While the sounder is armed, the CJB sends a periodic signal (heartbeat) to the BBUS, and the BBUS monitors the battery power supply and the communications link with the CJB. The BBUS operates the sounder if:

- It receives an alarm signal from the CJB or the tilt sensor.
- The power supply or the communications link from the CJB is disrupted.

The tilt sensor measures the longitudinal and lateral angle of the vehicle over a range of ±16° from the horizontal. When the active anti-theft system is armed in the volumetric mode, the BBUS stores the current angles in memory and monitors the tilt sensor readings. If the vehicle attitude changes in either direction by more than the alarm limit, the BBUS activates the sounder.

VOLUMETRIC SENSOR (WHERE FITTED)



E55866

Item	Part Number	Description
1	-	Rear transmitter/receiver pair
2	-	Electrical connector
3	-	Front transmitter/receiver pair
4	-	Cover

The volumetric sensor is installed in a cover attached to the center of the headliner, and monitors for intrusion into the passenger compartment when the active anti-theft system is armed.

The volumetric sensor consists of a microcontroller, two acoustic transmitters and two acoustic receivers. One transmitter and receiver pair faces forwards and one transmitter and receiver pair faces rearwards, to ensure complete coverage of the passenger compartment. The front transmitter and receiver pair are in a rubber mounting attached to the microcontroller housing. The rear transmitter and receiver pair are in a remote rubber mounting and connected to the microcontroller housing by a four wire lead.

The volumetric sensor is powered by a feed from the CJB. The CJB activates and de-activates the volumetric sensor when it arms and disarms the active anti-theft system in the volumetric mode. When the volumetric sensor is active it outputs ultrasonic pulses from the transmitters and checks the echoes picked up by the receivers for changes to the passenger compartment profile. If it detects a change of profile, indicating movement in the passenger compartment, the volumetric sensor reports the alarm to the CJB.

Each time the volumetric sensor is armed, it performs a self test. If there are no faults the volumetric sensor sends an acknowledgment signal to the CJB. If the CJB does not receive the acknowledgment signal it de-activates the volumetric sensor.

SYSTEM OPERATION

The CJB automatically arms and disarms the active anti-theft system when it operates the central locking system.
For additional information, refer to: Handles, Locks, Latches and Entry Systems (501-14 Handles, Locks, Latches and Entry Systems, Description and Operation).

Arming

On vehicles without the volumetric sensor and the tilt sensor, the active anti-theft system is armed in the perimeter mode when the vehicle is either locked or superlocked.

On vehicles with the volumetric sensor, the active anti-theft system is armed in one of two modes:

- Perimeter mode, where only the hinged panels are monitored, is employed when the vehicle is locked with the remote handset.

- Volumetric mode, where the hinged panels, the vehicle interior and, if the tilt sensor is incorporated, the vehicle attitude, are monitored. Volumetric mode is employed when the vehicle is superlocked with the remote handset.

The CJB arms the active anti-theft system when it locks or superlocks the vehicle, provided the following conditions coexist:

- The driver door is shut.
- A valid key is not in the ignition switch.
- The active anti-theft system is not in panic alarm mode.
- The active anti-theft system is enabled.
- The CJB is not in the transportation mode.

Mislock

If the driver door is open when a lock or superlock request is received, the active anti-theft system remains disarmed and the CJB generates a mislock sound with a 100 milliseconds 'chirp' on the horns.

When the CJB arms the active anti-theft system, it enters the perimeter mode by beginning to monitor the status of the hinged panels and, where applicable, sending an arming signal to the BBUS. On a vehicle with a volumetric sensor installed, the CJB then transitions into the volumetric mode by sending arming signals to the volumetric sensor and the tilt sensor. The CJB ignores alarm signals from the volumetric sensor for 30 seconds after sending the arming signal, to allow time for the vehicle interior to settle.

If any of the hinged panels, except the driver door, is open, the CJB arms in the perimeter mode, but ignores the open hinged panel as an alarm trigger and generates a mislock sound. On a superlocked vehicle with a volumetric sensor installed, if the open hinged panel is a door or the tailgate, the CJB remains in the perimeter mode instead of transitioning into the volumetric mode. If the open hinged panel is subsequently closed, and remains closed for 1 second, the CJB then includes it as a valid alarm trigger and, where appropriate, transitions into the volumetric mode.

Disarming

The CJB disarms the active anti-theft system when it receives an unlock request from the remote handset.

When the vehicle is unlocked using the left front door lock, the CJB disarms the active anti- theft system if a valid key is installed in the ignition switch or an unlock request is received from the remote handset. The CJB detects the installation of a valid key from the transponder coil around the ignition switch. The active anti-theft system cannot be disarmed by the left front door lock.

The CJB can selectively disarm parts of the active anti-theft system, to prevent nuisance alarms being triggered, as follows:

- When the active anti-theft system is armed in the volumetric mode, if the vehicle battery voltage decreases to less than 9 volts the CJB will transition into perimeter mode by disarming the volumetric sensor and the tilt sensor. This prevents false alarms caused by the sensors not operating below 9 volts.
- Where a BBUS is installed, if the vehicle battery voltage decreases from 9.5 to 9 volts in more than 30 minutes, the CJB will disarm the BBUS and, if necessary, use the horns as the audible warning. This prevents false alarms caused by the CJB not supplying the heartbeat signal to the BBUS below 9 volts, which the BBUS would interpret as a tamper condition. If the voltage rises above 9.5 volts the CJB re-arms the BBUS.

If the vehicle is unlocked using the remote handset and, within 1 minute, a hinged panel is not opened or a valid key is not put in the ignition switch, the CJB automatically relocks the vehicle and re-arms the active anti-theft system. This prevents the vehicle being left unlocked and disarmed by accidentally pressing the remote handset unlock button.

Alarm

When the alarm is triggered, audible and visible warnings are produced by the CJB. Audible warnings are produced using the horns or the BBUS. Visible warnings are produced using the hazard flashers.

If the BBUS is used for the audible warnings, the BBUS cycles the sounder on for 30 seconds and off for 5 seconds. If the alarm trigger is still present after the 5 seconds off period, the cycle of 30 seconds on, 5 seconds off, is repeated. The BBUS operates for a maximum of 10 cycles for each alarm trigger source, or until it receives a disarm signal.

If the horns are used for the audible warning, the CJB cycles the horns on for 30 seconds and off for 5 seconds. If the alarm trigger is still present after the 5 seconds off period, the cycle of 30 seconds on, 5 seconds off, is repeated. The CJB operates the horns for a maximum of 10 cycles for each arming cycle, or until it receives a disarm signal. The 10 cycle limit prevents damage to the horns from excessive use.

During the on period, the BBUS sounder or the horns are pulsed at 380 milliseconds on, 380 milliseconds off. The hazard flashers are also pulsed at 380 milliseconds on, 380 milliseconds off, in sequence with the audible warning.

The active anti-theft system transitions from an armed mode to the alarm mode if:

- The hood, a door or the tailgate is opened.
- The volumetric sensor signals an alarm condition.
- The tilt sensor signals an alarm condition.
- A non valid key is detected in the ignition switch. There is a 0.4 second delay between recognition of a key being installed

in the ignition switch and identification of the transponder, to allow sufficient time to interrogate the key.

- The left front door is unlocked, using the door lock, then opened, and the CJB does not detect a valid key in the ignition switch, or receive an unlock request from the remote handset.
- If the personal button on the remote handset is configured to panic alarm, when the button is pressed the CJB triggers the alarm as detailed above. The panic alarm operates with the active anti-theft system either armed or disarmed. The CJB cancels the panic alarm when it receives a lock or unlock request from the remote handset, or detects a valid key in the ignition switch. On NAS (north American specification) vehicles, after 160 seconds the panic alarm times out and the active anti-theft system returns to the previous operating state.

The alarm stops immediately and the active anti-theft system is disarmed on receipt of an unlock command from the remote handset.

The alarm stops immediately and the active anti-theft system returns to the armed mode on receipt of a lock command from the remote handset. The CJB ignores the current alarm trigger(s) and only considers the remainder of the alarm trigger sources as valid inputs for a further alarm. The ignored alarm trigger(s) are reinstated as valid alarm trigger sources after they remain in an untriggered state for a minimum of 1 second. For example, the active anti-theft system is armed in the volumetric mode when a door is opened and triggers the alarm. Pressing the lock button on the remote handset returns the active anti-theft system to the alarm mode and causes the CJB to ignore the inputs from the ajar switch of the open door and the volumetric sensor. One second after the door closes, the CJB considers the ajar switch input as valid again. After a further 30 seconds settling time, the CJB also considers the volumetric sensor input as valid again.

The CJB stores the last ten alarm triggers in a trigger log, which can be accessed over the medium speed controller area network (CAN) bus using T4. The trigger log can only be cleared when the system is disarmed. Each trigger entry contains a number that corresponds to the trigger source.

Alarm Trigger Sources

Trigger No.	Description
0	No trigger stored
1	Driver door ajar switch
2	Front passenger door ajar switch
3	Rear left-hand (LH) door ajar switch
4	Rear right-hand (RH) door ajar switch
5	Tailgate or rear window ajar switch
6	Hood ajar switch
7	Ignition switch
8	External key lock turned to unlock
9	Tilt sensor
10	Volumetric sensor

If an alarm is triggered during an armed cycle, when the active anti-theft system is subsequently disarmed the CJB pulses the hazard flashers at 200 milliseconds on, 200 milliseconds off, for 3 seconds.

Transportation Mode

When the vehicle is in the transportation mode, the active anti-theft system is disabled.

Diagnostics

The CJB monitors the communication links with the BBUS, the tilt sensor and the volumetric sensor. If any of the communications links fail, the CJB stores a related fault code, which can be accessed with T4.

Diagnostic Fault Codes

Fault	Description
BBUS Communication Failure	If a response is not received on the BBUS LIN bus within 12 seconds of a status request from the CJB, the BBUS Communication Failure fault code is set. The CJB continues trying to communicate with the BBUS even if a communication failure has occurred.
BBUS Internal Fault	If the CJB sends a command (Arm / Disarm / Alarm / Sleep) to the BBUS, and the status from the BBUS does not show the BBUS has responded to the command within 12 seconds, the 'BBUS Internal Fault' fault code is set.
BBUS Trigger Source	The BBUS Trigger Source stores the reason for the last BBUS sound cycle. The values which can be stored are: 0 = Not triggered 1 = Due to power interruption 2 = Due to LIN communication interruption 3 = Due to an external command from the CJB
Tilt Sensor Internal Fault	If the CJB sends a command (Arm / Disarm / Sleep) to the tilt sensor in the BBUS, and the status from the BBUS does not show the BBUS has responded to the command within 12 seconds, the 'Tilt Sensor Internal Fault' fault code is set.

Fault	Description
Volumetric Communication Failure	If a 100 milliseconds pulse response is not received on the Volumetric Trigger line, within 350 milliseconds of an arm command from the CJB, the Volumetric Communication Failure fault code is set.

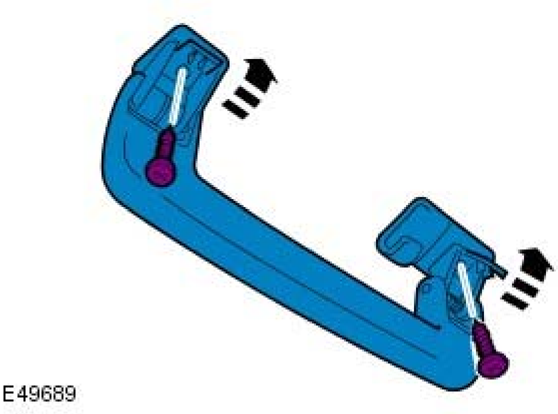
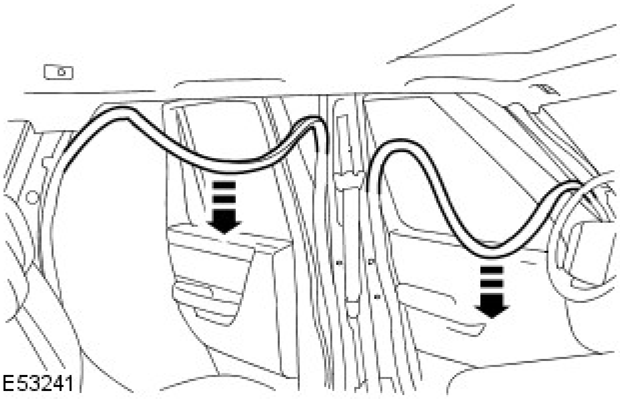
Removal and Installation

Removal

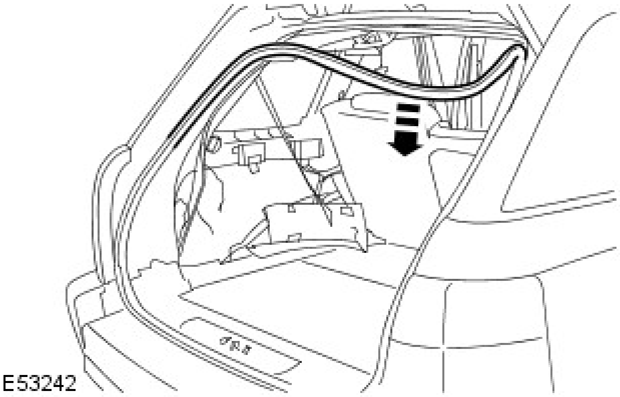
1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the RH B-pillar upper trim panel.
   For additional information, refer to: B-Pillar Upper Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Remove the RH C-pillar upper trim panel.
   For additional information, refer to: C-Pillar Upper Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).
4. Remove the RH D-Pillar upper trim panel.
   For additional information, refer to: D-Pillar Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).



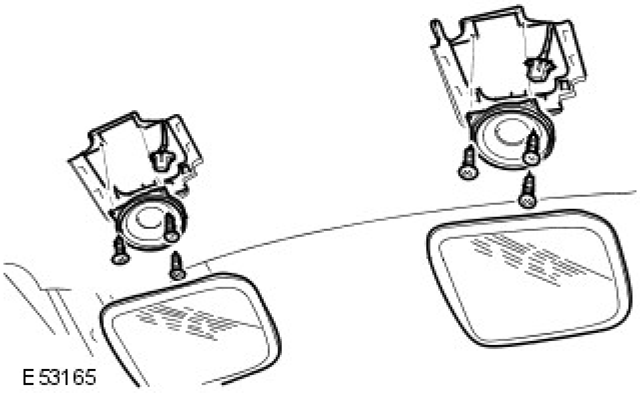
5. Remove the passenger assist handle.
   - Release the 2 screw covers.
   - Remove the 2 screws.
   - Repeat the above procedure for the other handle.



6. Release the front and rear door weatherstrips for access.

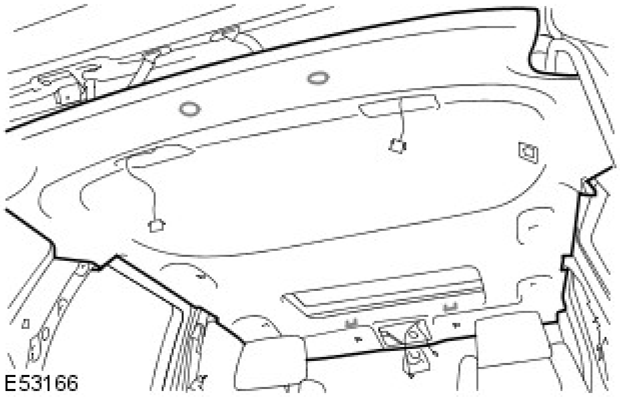


7. Release the liftgate weatherstrip



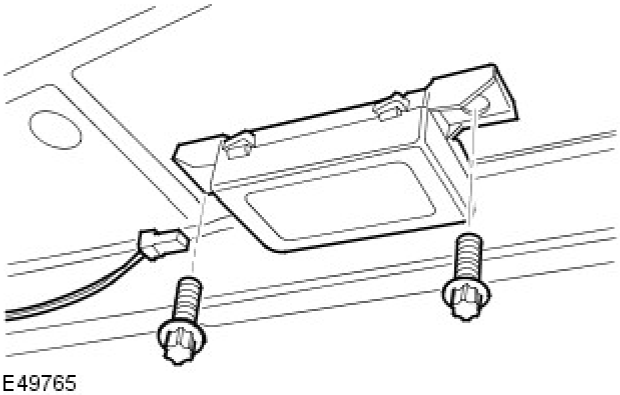
8. Remove the rear speakers.

- Remove the speaker grilles.
- Remove the 6 screws.
- Disconnect the 2 electrical connectors.



9. Release the headliner for access.

- Release the 2 clips.



10. Remove the alarm antenna.

- Release and disconnect the electrical connector.
- Remove the 2 bolts.

Installation

1. Install the alarm antenna.
    - Tighten the bolts to 6 Nm (4 lb.ft).
    - Connect and secure the electrical connector.
2. Install the headliner.
    - Secure in the clips.
3. Attach the door weatherstrips.
4. Install the passenger assist handles.
    - Install the screws.
    - Secure the screw covers.
5. Install the rear speakers.
    - Connect and secure the electrical connectors.
    - Install the screws.
    - Install the speaker grilles.
6. Install the D-pillar upper trim panel.
   For additional information, refer to: D-Pillar Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).
7. Install the C-pillar upper trim panel.
   For additional information, refer to: C-Pillar Upper Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).
8. Install the B-pillar upper trim panel.
   For additional information, refer to: B-Pillar Upper Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).
9. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

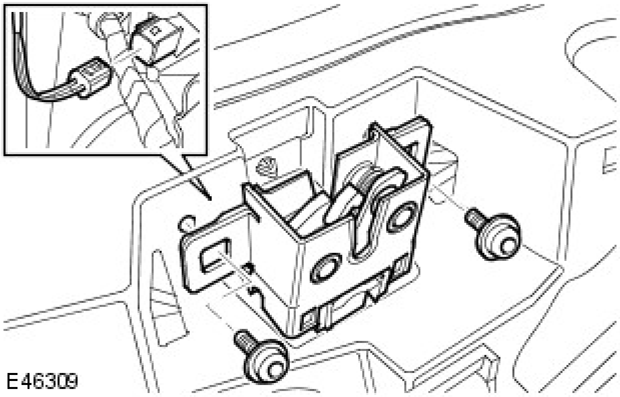
Anti-Theft - Active - Hood Switch

Removal and Installation

Removal

• NOTE: **Before installing a new hood switch, diagnose the hood switch by using a digital multimeter. Make sure that continuity through hood switch is present when the switch is pressed (hood closed condition). Repeat the test to make sure continuity IS NOT present when the switch IS NOT pressed. If the hood switch continuity is NOT present, continue with this procedure. If the continuity is present, install the original hood switch to the vehicle.**

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).



2. Release the RH hood latch.

- Remove the 2 Torx bolts.
- Disconnect the electrical connector.

3. Remove the hood switch.

Installation

1. Install the hood switch.

2. Install the RH hood latch.

- Connect the electrical connector.
- Tighten the Torx bolts to 10 Nm (7 lb.ft).

3. Open and close the hood to check the hood latch operation.

4. Adjust the hood latch.

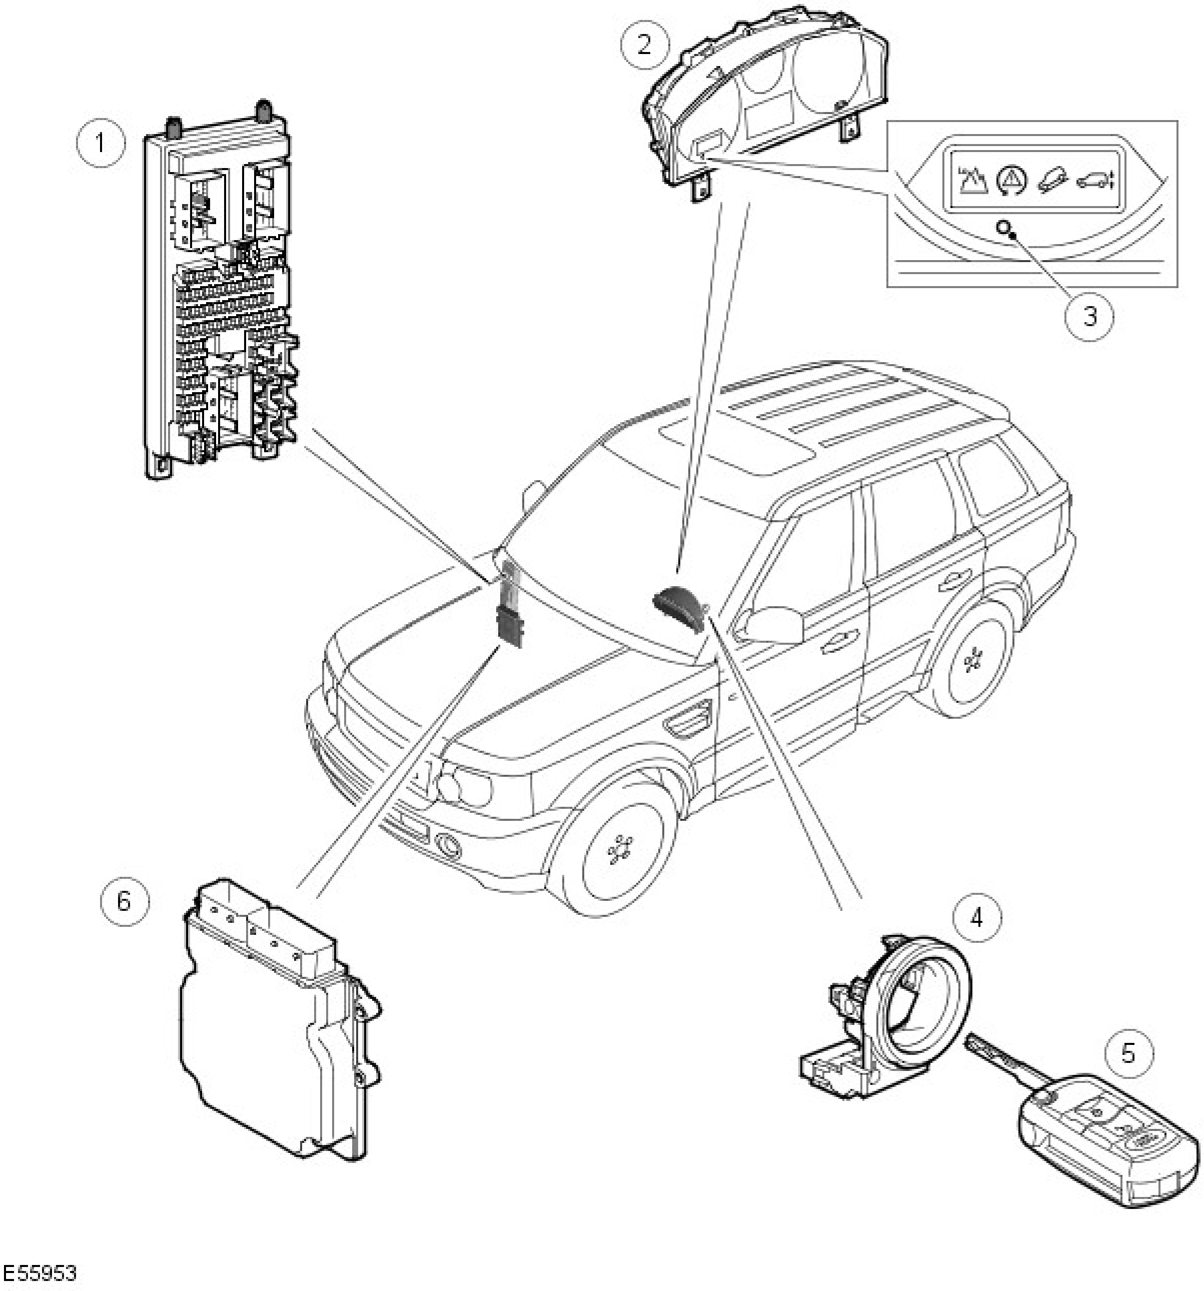
- Loosen the 2 hood latch Torx bolts.
- Lower the hood and check for alignment.
- Open the hood and tighten the Torx bolts to 10 Nm (7 lb.ft).
- Check for the correct operation of the hood safety catch.
- If necessary, repeat the above adjustment procedure.

Anti-Theft - Passive - Anti-Theft - Passive

Description and Operation

COMPONENT LOCATIONS

- NOTE: left-hand drive (LHD) installation shown, right-hand drive (RHD) installation similar



Item	Part Number	Description
1	-	central junction box (CJB)
2	-	Instrument cluster
3	-	Alarm indicator
4	-	Transponder coil
5	-	Ignition key with transponder
6	-	engine control module (ECM)

GENERAL

The passive anti-theft system provides a secure interface, between the ignition key and the ECM, to prevent unauthorized starting of the engine and immobilize the vehicle. The same system is installed for all engine variants. Each passive anti-theft system consists of the following:

- A transponder in the head of each ignition key.
- A transponder coil around the ignition switch.
- A passive anti-theft system in the CJB.

The passive anti-theft system also uses:

- The alarm indicator, to show the passive anti-theft status.
- The instrument cluster, as a gateway for communications with the ECM.

Operation of the passive anti-theft system is automatic and requires no input from the driver. The engine management system will only crank and run the engine when a valid key is in the ignition switch.

When it senses a key in the ignition switch the CJB energizes the transponder coil, which activates the transponder. The transponder transmits identification and rolling code data to the CJB. The CJB checks the data from the transponder against stored data to validate the key. When the ignition switch is turned to position II (ignition), the ECM sends a start authorization request to the CJB. If the key is valid the CJB grants the request and the ECM will subsequently crank and run the engine. If the key is invalid, the CJB refuses the request and the ECM will not crank the engine.

TRANSPONDER

The transponder is an integral part of the PCB (printed circuit board) located within the head of the ignition key.
For additional information, refer to: Handles, Locks, Latches and Entry Systems (501-14 Handles, Locks, Latches and Entry Systems, Description and Operation).

The transponder is powered by a rechargeable battery and is contained within the processor on the PCB, which also controls the remote operation of the CLS (central locking system). A separate coil on the PCB is used by the transponder to receive the signals from the transponder coil on the ignition switch. The coil is also used to generate the current required to recharge the battery.

The transponder has a 256 byte electrically erasable programmable read only memory (EEPROM), which is programmed with vehicle identification data and a unique identification code. This information is stored in one of 30 key 'slots' within the CJB. When energized, the transponder emits the coded information which is received by the CJB. The CJB checks that the key is valid by confirming the received data before granting permission to start the engine. The information programmed into the transponder cannot be overwritten. If a key is lost or is no longer required, T4 can be used to disable the key to prevent it being used on the vehicle.

TRANSPONDER COIL

The transponder coil is located in a plastic housing which surrounds the ignition switch barrel. The transponder coil is connected via two wires to the CJB. The CJB emits electrical energy to the transponder coil which transmits data at a frequency of 125 kHz. This electrical energy excites the transponder in the ignition key when it is within 20 mm (0.78 in) of the transponder coil.

CJB

The CJB is the main component in the passive anti-theft system. The CJB contains a processor and software which controls the passive anti-theft system. The CJB is connected to the medium speed controller area network (CAN) bus, which it uses to communicate with the ECM via the instrument cluster and the high speed CAN bus.

When the ignition key is placed in the ignition switch key barrel, the passive anti-theft system wakes up. The transponder coil is activated causing the transponder to transmit its coded data. The CJB validates the data and transmits another request for the data. When this is received for a second time, the CJB confirms the key as valid.

Replacement CJBs are not stock items and can only be installed on the vehicle for which they were ordered. After replacement of a CJB:

- Car configuration information from the instrument cluster is automatically transferred to the new CJB.
- T4 must be used to ensure that only those ignition keys currently in use with the vehicle are enabled in the CJB.

ALARM INDICATOR

The alarm indicator is located in the instrument cluster, below the tachometer. The alarm indicator provides information about the status of the active and passive anti-theft systems. Operation of the alarm indicator is controlled by the CJB using a hardwired connection with the instrument cluster.

For passive anti-theft system status, when the active anti-theft system is disarmed and the vehicle is immobilized (key out of ignition switch), the alarm indicator flashes once every 2 seconds. When the active anti-theft system is disarmed and the vehicle is mobilized, the alarm indicator performs a 1 second confirmation flash (when the ECM confirms to the CJB that it is in the mobilized state) and then remains off.

Navigation System - Navigation System

Description and Operation

INTRODUCTION TO THE GLOBAL POSITIONING SYSTEM (GPS)

The system used to calculate the current position of the vehicle is called the global positioning system (GPS). The system utilizes satellites which are owned by the United States Department of Defense (DoD). A total of 24 satellites orbit the earth every 12 hours at a height of 20,000 km (12500 miles), and between 5 and 11 of these satellites can be seen from a single point at any given time. The orbits are tilted to the earth's equator by 55 degrees to ensure coverage of polar regions. Each satellite transmits radio signals to provide information about the satellite position i.e. latitude, longitude, altitude, almanac data and an accurate time signal generated by an on-board atomic clock. Each satellite contains four atomic clocks.

The vehicle needs to receive data from at least four different satellites to give a three dimensional fix on its current position.

As the vehicle moves, this information is continually being updated. The computer determines which satellites are 'visible' to the system and their current position and relationship to each other. Using this information the computer can account for positional deviations of the satellites and compensate to enhance the accuracy of the navigation system.

The GPS signal is also known as the Precision Positioning Signal (PPS).

PPS predictable accuracy is:

- 22 meters horizontal accuracy
- 27.7 meters vertical accuracy
- 200 nanoseconds time accuracy.

Each navigation system provides computer generated audible and visual route guidance information to enable the driver to reach a desired destination. The system allows the driver to choose the desired route using minor or major roads or highways and the quickest or shortest route. Directions to hospitals, museums, monuments and hotels are also available. The computer uses map information stored on a compact disc (CD)-ROM to determine the best route for the journey and provide the driver with details of directions and approaching junctions.

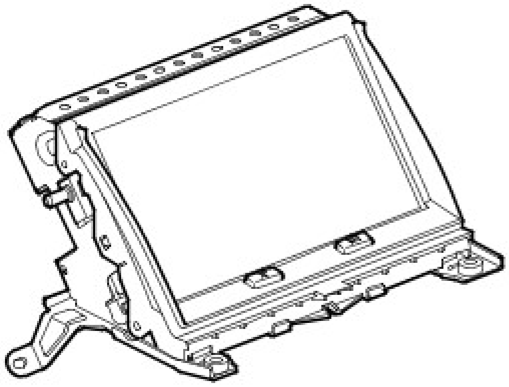
The navigation system comprises the following components:

- Touch Screen Display (TSD)
- Navigation computer
- GPS antenna

In addition to the standard navigation system it is possible in certain markets to add:

- Traffic Message Channel (TMC) system
- Vehicle Information and Communication System (VICS, Japan only)

Touch Screen Display



E48202

The Touch Screen Display (TSD) is located in the center of the instrument panel. The TSD is a touch sensitive 7 inch liquid crystal display (LCD) VGA screen containing 800 x 480 pixels in a 15:9 format. The TSD is connected to the infotainment system on the Media Oriented Systems Transport (MOST) ring. The MOST ring is a fibre optic communications data bus that allows high speed transfer of control instructions and audio around the system.

The TSD processes its own video for system operation but receives the navigation graphics from the navigation computer on a dedicated serial link called GVIF (Gigabit Video Interface).For additional information, refer to:

Communications Network (418-00 Module Communications Network, Description and Operation),
Audio System (415-01 Audio Unit, Description and Operation),
Video System (415-07 Video System, Description and Operation).

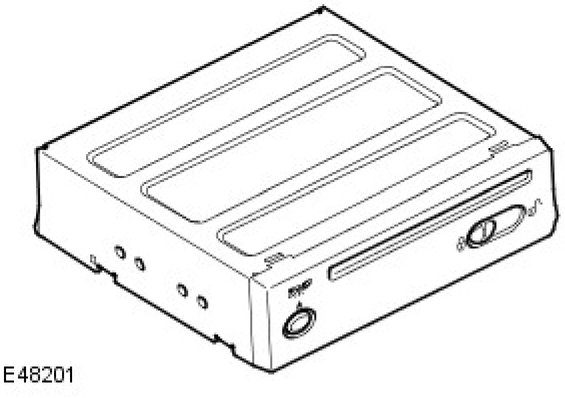
Navigation Computer



E48201

The navigation computer is located under the front LH seat.

The navigation computer is a digital versatile disc (DVD) based system to allow for a greater capacity of data to be stored. This means that map discs can now carry far more information than the previous CD based discs. For example there is now one map disc for Europe where previous CD based systems have required different discs for each country. The navigation computer also carries the GPS receiver and the voice recognition software.

The navigation computer is connected to the TSD by a private CAN bus and a dedicated GVIF (Gigabit Video Interface). The GVIF carries all the video information to the TSD, while the CAN bus is used for data and control instructions to and from the TSD.

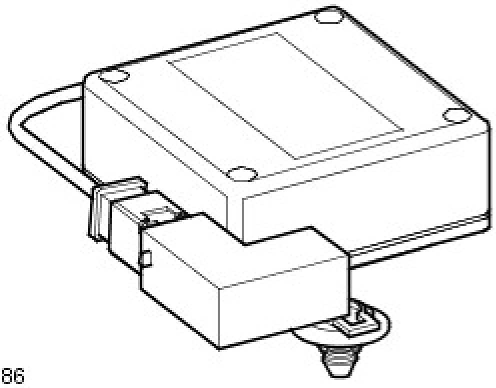
GPS Antenna



E48086

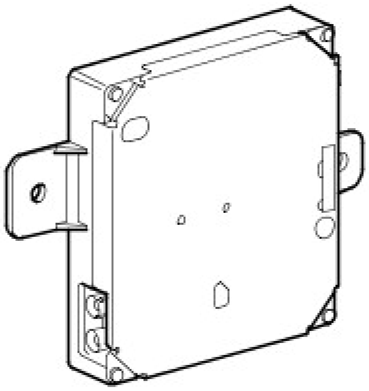
The GPS antenna is located in a pod which is located in the center of the vehicle roof at the rear. The GPS antenna is connected to the GPS computer by a single co-axial cable and passes signals from the GPS satellites to the navigation computers built in receiver for processing.

It is possible for the GPS antenna to lose the signal from the GPS satellites:

- In hilly or tree lined areas
- Built up areas with tall buildings
- In multi storey car parks
- In garages
- In tunnels
- In bridges
- During heavy rain or thunderstorms.

When the signal is lost the navigation computer will continue to give guidance using memory mapped data from the DVD map until the signal is restored.

Traffic Message Channel (TMC) Receiver



E48203

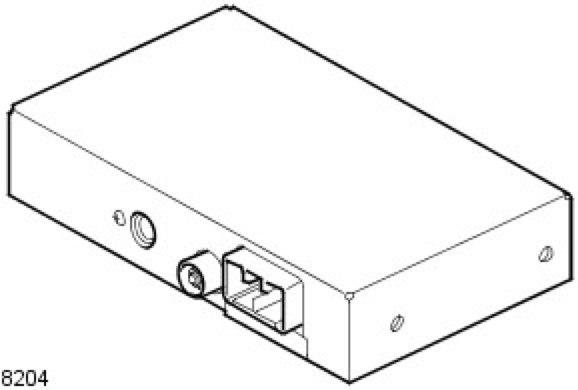
The Traffic Message Channel (TMC) receiver is located in the rear right-hand (RH) side of the luggage compartment. The TMC receiver is connected to the MOST ring and transmits TMC data to the navigation computer (via the TSD). The navigation computer then displays this information on the TSD and also re-routes the navigation guidance around any traffic hold ups. The TMC data is received via the frequency modulation (FM) antenna located in the rear screen via an antenna amplifier located above the rear tailgate spoiler.
For additional information, refer to: Antenna (415-02 Antenna, Description and Operation).

TMC is available in many European markets.

Vehicle Information and Communication System (VICS Japan only) Receiver

The VICS system comprises the following components:

- VICS receiver
- VICS beacon antenna
- VICS RF antenna

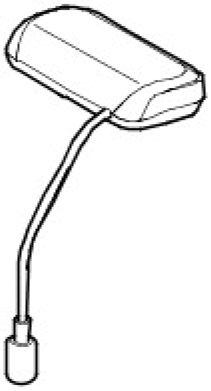


E48204

The VICS receiver is located behind the instrument panel between the heater assembly and the in-vehicle crossbeam. The VICS receiver is connected to the navigation computer via a dedicated link.

The VICS receiver, receives information from the beacon antenna in the center of the instrument panel and the VICS antenna located in the rear screen element.
For additional information, refer to: Antenna (415-02 Antenna, Description and Operation).

VICS Beacon Antenna



E48090

The VICS beacon antenna is located on top of the instrument panel. The antenna receives infra red and RF signals from road side transmitters.

NAVIGATION SYSTEM OPERATION

The navigation system receives GPS information via the GPS antenna. The GPS signals are used by the navigation computer to calculate the vehicles position. Once the driver has input a desired destination the navigation computer can calculate a route, based on the drivers pre-determined preferences or the default settings in the navigation computer.

The navigation system is accessed by pressing the navigation button at the bottom left hand side of the TSD. The driver will then have the option of on road navigation or off road navigation.

On Road Navigation

On road navigation is initiated by the driver inputting a destination. This can be achieved by:

- Entering in an address using the TSD.
- Entering a post code.
- Choosing a pre-entered address from the address book.
- Choosing a point of interest from the map disc database.

The driver is then guided to the destination by a scrolling map display and voice guidance. The display can be varied by scale and display type.

Off Road Navigation

The off road navigation route comprises a series of way points which are followed sequentially. Direct point to point guidance is given to the first way point in the route. When the vehicle arrives at the first way point guidance is given to the second way point in the route. This process continues for subsequent way points until the final way point (destination) is reached.

The routes are stored in the non-volatile memory of the navigation computer.

The routes can be entered on the TSD and comprise way points, longitude and latitude destination and previously stored routes.

The different route guidance screens give the user the information required for direct point to point direction to the selected destination (guidance mode). The same guidance screens are also available even when guidance is not being given (compass mode). Not all the destination and guidance information is shown on the guidance screens when in compass mode. I this instance the route title is ’COMPASS MODE’.

4x4 I

4x4i gives the driver additional information regarding the following vehicle systems:

- Suspension travel
- Gear selected
- Range selected
- Terrain response
- Vehicle heading
- Compass heading
- Steering wheel angle.

The 4x4i System uses inputs from other vehicle systems to display information about suspension and transmission operation along with navigational information.

TRAFFIC MESSAGE CHANNEL (TMC) SYSTEM

The Traffic Message Channel (TMC) is a function of the FM Radio Data System (RDS). The system broadcasts real-time traffic and weather information. Data messages are received and decoded by the TMC receiver and passed onto the navigation system, which then delivers them via the navigation system interface. TMC messages are filtered by the navigation computer so that only those relevant to the current journey are displayed, allowing the navigation system to offer dynamic route guidance - alerting the driver of a problem on the planned route and calculating an alternative route to avoid the incident.

TMC traffic information systems conform to a global standard that has been adopted by traffic data gatherers, information service providers, broadcasters and vehicle/receiver manufacturers. TMC information is received via the normal FM radio antenna.

All TMC receivers use the same list of event codes, while the location database (on the map disc) contains both a country-specific set of location codes for the strategic European road network

TMC traffic data is currently broadcast in many European countries.

VEHICLE INFORMATION and COMMUNICATION SYSTEM (VICS, Japan only)

The VICS system supplies the navigation computer with information to enable the navigation computer to re-route the navigation guidance or to inform the vehicle driver of traffic conditions in the vehicles vicinity. Information is provided to the system through three routes:

- RF transmission
- Infra-red transmission
- FM multiplex transmissions.

The information is passed to the navigation computer via the VICS receiver and the IHU

RF Transmission

RF transmission is generally transmitted from road side beacons mainly on expressways. The information transmitted is:

- Traffic congestion
- Travel time to next intersection
- Traffic conditions in surrounding areas and expressway turn offs
- Traffic accidents
- Speed limits
- Lane regulations
- Tire change
- Parking availability at expressway service areas and parking areas.

The RF transmissions are received by the beacon antenna mounted on the top of the instrument panel.

Infra-Red Transmission

Infra-Red transmissions are transmitted from road side beacons on major trunk roads. The information transmitted is:

- Traffic congestion and travel time

- Traffic accidents
- Breakdowns
- Road works restrictions
- Parking availability.

FM transmissions

FM transmissions are broadcast as part of the normal RDS FM transmission. Information transmitted is:

- Traffic congestion and travel time for wide areas
- Traffic accidents, road works, speed limits and lane restrictions for a wide area
- Parking availability information.

DIAGNOSTICS

The TSD and the navigation computer both have built in self tests that allow the technician to diagnose fault conditions. Fault codes and diagnostics can also be achieved via T4.

TSD Diagnostics

The TSD has in built diagnostics to aid the diagnosis of system faults. The diagnostics allow the technician to interrogate the following:

- Hard key function
- Touch screen function
- Video input
- RGB video
- Vehicle signals
- Self test
- Configurations
- Vehicle configurations
- MOST ring function.

The built in diagnostics are accessed as follows:

- Once the system is powered up enter the 'Home' menu page.
- Press and hold the TSD in the center at the top of the screen for approximately 5 seconds and then press the navigation hard key.
- A 'Diag PIN Entry' box will appear' Type in the access code 753.
- Once this code has been accepted the Diagnostic Menu screen will be displayed.

Hard Key Test Screen

The hard key test is used to determine the function of the two switches integrated into the TSD. Pressing either of the buttons will turn the corresponding icon on the screen green if it is functioning correctly.

Touch Screen Test Screen

Entering the Touch screen test screen allows the technician to test the physical side of the touch screen. The technician can choose between checking the screen integrity and re-calibrating the screen. Using the Touch Switch Check button will display a blank screen. Touching the screen in any place will give a series of co-ordinates. If a faulty area of the screen is touched the co-ordinates will not display.

Re-calibrating the screen allows the technician to align the touch screen co-ordinates to the pressing of the screen. This is achieved by pressing a series of on screen targets as they are displayed.

Vehicle Signals

The vehicle signals screen displays inputs from other vehicle systems to the TSD. These signals include:

- Battery voltage
- Lights (on or off)
- Graphic illumination dimming duty
- Output audio allocation
- PCB temp
- Speed inhibit (on or off)
- MOST Fibre Optic Transceiver (FOT) temperature
- Parking brake position (electric park brake on or off)
- Backlight pulse width modulation (PWM) duty
- Beep volume
- Beep tone.

Video Input Test

This screen will allow the testing of video inputs that are connected to the TSD. This includes TV/DVD Rear Seat Entertainment (RSE) and television.

RGB Color Test

This function allows the technician to test the colors generated by the TSD. A second screen displays six solid colors, selecting the color will fill the screen with the chosen color and pressing the TSD again will revert back to the color test screen.

Self Test

The self test function displays any fault codes that are present for the TSD. The screen also displays the current state of the ignition switch and the battery voltage.

Two additional buttons in the screen allow the technician to clear the fault codes and to test the TSD.

Configurations

The configurations screen displays information about the TSD and the navigation computer. Switching between the two components is achieved via the soft key at the top LH corner of the screen.

The information contained in the screens is as follow:

- Vehicle type
- Component serial number
- Component part number
- Component part level
- CPU/bootloader lever
- Main CPU application version
- Sub CPU software version
- Private CAN database version.

Vehicle Configurations

Selecting the vehicle configurations option allows the technician to inspect the components fitted to the vehicle entertainment system. There are four screens which can be navigated through via the next and previous buttons.

MOST Test

The MOST test screen displays information about the MOST signals being sent around the MOST ring. Using any part of the audio system will bring up the MOST message on the screen. This can be used to help diagnose MOST related faults.

Navigation Computer Diagnostics

The navigation computer has in built diagnostics to aid the diagnosis of system faults. The diagnostics allow the technician to interrogate the following:

- Navigation info
- Parts info
- Manual check
- Self check.

Each area has sub level of menus to access further information.

The built in diagnostics are accessed as follows:

- Once the system is powered up enter the navigation system via the navigation hard key.
- Agree to the disclaimer screen.
- Enter the navigation home menu.
- Press and hold the TSD in the center at the top of the screen.
- A 'Diag PIN Entry' box will appear, type in the access code 753.

Once this code has been accepted the on screen diagnostics menu will be displayed. The menu has the following options:

- Navigation info
- Manual check
- Parts info
- Self check.

Navigation Info

The navigation info menu has three sub menus:

- Vehicle signals
- GPS information
- Reset position.

Parts Info

Parts info displays information on the system component and software versions.

Manual Check

The manual check menu enables the technician to complete the following self tests:

- Navi RGB screen test
- Microphone input level test
- Voice output test.

Self Check

Self check runs an internal check on the navigation computer and displays any fault codes on the TSD.

Navigation System diagnostic trouble code (DTC)

Displayed DTC	DTC Description	Fault Condition
U1A0087	Private CAN Communications fault	No Connector on navigation computer. Comms fault.
B1B0049	Navigation computer internal fault	
B1A0049	HLDF internal fault	
B1A8911	GPS antenna short circuit to GND	GPS Comms error
B1A8913	GPS antenna open circuit	GPS Comms error
B1D6287	VICS ECU communication error	
B1D6249	VICS module error	
U1A0131	GVIF fault	GVIF not connected
U300068	MOST FOT Over-Temperature	MOST transceiver overheating
B100E25	TV/RSE Video Input Failure	Input not connected
B100F25	Companion Video Input Failure	Input not connected
B101025	Rear Camera Video Failure	Input not connected

Navigation System - Navigation System

Diagnosis and Testing

Principles of Operation

The information in this section is intended to help with basic diagnosis of the navigation system.

For a detailed description of the Navigation System, refer to the relevant Description and Operation section in the Workshop Manual.

Touch Screen Display (TSD) and Navigation Diagnostics

The TSD and the navigation module both have built in self tests that allow the technician to diagnose fault conditions. Fault codes and diagnostics can also be retrieved/achieved using the manufacturer approved diagnostic system.

TSD Diagnostics

The TSD has in built diagnostics to aid the diagnosis of system faults. The diagnostics allow the technician to interrogate the following:

- Hard key function
- Touch screen function
- Video input
- RGB video
- Vehicle signals
- Self test
- Configurations
- Vehicle configurations
- MOST ring function

The built in diagnostics are accessed as follows:

- Once the system is powered up enter the 'Home' menu page
- Press and hold the TSD in the center at the top of the screen for approximately 5 seconds and then press the navigation hard key (Discovery, Bottom Left - Range Rover, Top Right)
- A 'Diag PIN Entry' box will appear' Type in the access code 753
- Once this code has been accepted the Diagnostic Menu screen will be displayed

Hard Key Test Screen

The hard key test is used to determine the function of the two switches integrated into the TSD. Pressing either of the buttons will turn the corresponding icon on the screen green if it is functioning correctly.

Touch Screen Test Screen

Entering the Touch screen test screen allows the technician to test the physical side of the touch screen. The technician can choose between checking the screen integrity and re-calibrating the screen. Using the Touch Switch Check button will display a blank screen. Touching the screen in any place will give a series of co-ordinates. If a faulty area of the screen is touched the co-ordinates will not display.

Re-calibrating the screen allows the technician to align the touch screen co-ordinates to the pressing of the screen. This is achieved by pressing a series of on screen targets as they are displayed.

Vehicle Signals

The vehicle signals screen displays inputs from other vehicle systems to the TSD. These signals include:

- Battery voltage
- Lights (on or off)
- Graphic illumination dimming duty
- Output audio allocation
- PCB temp
- Speed inhibit (on or off)
- MOST Fibre Optic Transceiver (FOT) temperature
- Parking brake position (electric park brake on or off)
- Backlight PWM duty
- Beep volume
- Beep tone

Video Input Test

This screen will allow the testing of video inputs that are connected to the TSD. This includes TV/DVD Rear Seat Entertainment (RSE) and television.

RGB Color Test

This function allows the technician to test the colors generated by the TSD. A second screen displays six solid colors, selecting the color will fill the screen with the chosen color and pressing the TSD again will revert back to the color test screen.

Self Test

The self test function displays any fault codes that are present for the TSD. The screen also displays the current state of the ignition switch and the battery voltage.

Two additional buttons in the screen allow the technician to clear the fault codes and to test the TSD.

Configurations

The configurations screen displays information about the TSD and the navigation module. Switching between the two components is achieved via the soft key at the top LH corner of the screen.

The information contained in the screens is as follow:

- Vehicle type
- Component serial number
- Component part number
- Component part level
- CPU/bootloader lever
- Main CPU application version
- Sub CPU software version
- Private CAN database version

Vehicle Configurations

Selecting the vehicle configurations option allows the technician to inspect the components installed to the vehicle entertainment system. There are four screens which can be navigated through via the next and previous buttons.

MOST Test

The MOST test screen displays information about the MOST signals being sent around the MOST ring. Using any part of the audio system will bring up the MOST message on the screen. This can be used to help diagnose MOST related faults.

Navigation Module Diagnostics

The navigation module has in built diagnostics to aid the diagnosis of system faults. The diagnostics allow the technician to interrogate the following:

- Navigation info
- Parts info
- Manual check
- Self check

Each area has a sub level of menus to access further information.

The built in diagnostics are accessed as follows:

- Once the system is powered up enter the navigation system via the navigation hard key
- Agree to the disclaimer screen
- Enter the navigation home menu
- Press and hold the TSD in the center at the top of the screen
- A 'Diag PIN Entry' box will appear, type in the access code 753

Once this code has been accepted the on screen diagnostics menu will be displayed. The menu has the following options:

- Navigation info
- Manual check
- Parts info
- Self check

Navigation Info

The navigation info menu has three sub menus:

- Vehicle signals
- GPS information
- Reset position

Parts Info

Parts info displays information on the system component and software versions.

Manual Check

The manual check menu enables the technician to complete the following self tests:

- Navigation RGB screen test
- Microphone input level test
- Voice output test

Self Check

Self check runs an internal check on the navigation module and displays any fault codes on the TSD.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious electrical faults.

Visual Inspection

Electrical
• Battery • Fuses - Central and Battery Junction Boxes - Megafuses • Wiring harness • Damaged, loose or corroded connectors • Touch Screen Display (TSD) • GPS antenna • Navigation module • Steering wheel controls • Clock spring • Integrated Head Unit (IHU) • Audio amplifier • Anti-lock Brake System (ABS) module • Wheel speed sensors • Vehicle Information and Communication System (VICS Japan only) receiver • VICS beacon antenna (Japan only) • Controller Area Network (CAN) circuits • Media Oriented System Transport (MOST) system • Gigabit Video Interface (GVIF) • Central Junction Box (CJB)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any DTCs before moving onto the DTC index.
    - ○ Make sure that all DTCs are cleared following rectification.

Symptom Chart

Symptom	Possible Cause	Action
Lost satellite reception	• Vehicle not in clear view of satellites • GPS antenna circuit: short circuit to ground, short circuit to power, high resistance • GPS antenna failure • Navigation module failure • Antenna is disconnected	• NOTE: Time taken to lock on to satellites can be several minutes after ignition status is switched to 'ON' It is possible for the GPS antenna to lose satellite reception in hilly or tree-lined areas, built-up areas, in multi-storey car parks, tunnels or during heavy rain or thunderstorms. Check for DTCs indicating an antenna or navigation module fault.

Symptom	Possible Cause	Action
Touch screen display (TSD) displays a high temperature message and shuts down	● MOST fibre optic transceiver (FOT) over-temperature ● FOT temperature greater than 85°C	Check MOST FOT temperature in TSD diagnostics, vehicle signals. Once the temperature is reduced the system will resume normal operation. If the system does not resume normal operation, check for DTCs indicating an information and entertainment system fault.
Touch screen display (TSD) displays a low temperature message and shuts down	● TSD too cold ● TSD temperature less than -25°C	Check MOST FOT temperature in TSD diagnostics, vehicle signals. Once the temperature is increased the system will resume normal operation. If the system does not resume normal operation, check for DTCs indicating an information and entertainment system fault.
Blank screen	● Temperature in passenger compartment too low ● Condensation in passenger compartment ● Electrical harness open/short circuit, dis-connected ● Component failure	GO to Pinpoint Test A.
No display on navigation screen (screen does not change)	● Electrical harness open/short circuit, dis-connected ● Component failure	GO to Pinpoint Test B.
Hard switches do not respond	● Component failure ● Switch failure	GO to Pinpoint Test C.
Radio screen will not display (Range Rover Only)	● Component failure ● Switch failure	GO to Pinpoint Test D.
CD screen will not display (Range Rover Only)	● Component failure ● Switch failure	GO to Pinpoint Test E.
TV/DVD screen will not display	● Component failure ● Switch failure	GO to Pinpoint Test F.
AUX. screen will not display (Range Rover Only)	● Component failure ● Switch failure	GO to Pinpoint Test G.
Display screen will not switch to low light	● Electrical harness open/short circuit, dis-connected ● Component failure	GO to Pinpoint Test H.
Noise interferes on each screen and the colors are abnormal	● Electrical harness open/short circuit, dis-connected ● Component failure	GO to Pinpoint Test I.
Disturbance on screen (synchronization abnormal)	● Electrical harness open/short circuit, dis-connected ● Component failure	GO to Pinpoint Test J.
Screen color is abnormal	● Electrical harness open/short circuit, dis-connected ● Component failure	GO to Pinpoint Test K.
Map disc will not insert/eject	● Electrical harness open/short circuit, dis-connected ● Component failure ● Map disc failure	GO to Pinpoint Test L.
Touch switches do not respond	● Electrical harness open/short circuit, dis-connected ● Component failure	GO to Pinpoint Test M.
Considerable deviation between displayed vehicle position and actual position	● Electrical harness open/short circuit, dis-connected ● Component failure	GO to Pinpoint Test N.

Symptom	Possible Cause	Action
GPS mark does not appear	● Electrical harness open/short circuit, dis-connected ● Component failure ● No reception from satellite	GO to Pinpoint Test O.
No sound	● Electrical harness open/short circuit, dis-connected ● Component failure ● Incorrect system settings	GO to Pinpoint Test P.
No voice recognition	● Electrical harness open/short circuit, dis-connected ● Component failure ● No map disc inserted	GO to Pinpoint Test Q.
Vehicle current position mark turns on its own	● Electrical harness open/short circuit, dis-connected ● Component failure	GO to Pinpoint Test R.
Vehicle position does not update	● Map disc contaminated/damaged ● Electrical harness open/short circuit, dis-connected ● Component failure	GO to Pinpoint Test S.
Route calculations cannot be performed	● Map disc contaminated/damaged ● Electrical harness open/short circuit, dis-connected ● Component failure	GO to Pinpoint Test T.
Map display is incomplete	● Map disc contaminated/damaged ● Electrical harness open/short circuit, dis-connected ● Component failure	GO to Pinpoint Test U.
Vehicle position mark moves in the opposite direction to the direction of travel	● Electrical harness open/short circuit, dis-connected ● Component failure	GO to Pinpoint Test V.
Cannot make or receive calls with the bluetooth telephone - cannot connect to the vehicle	● Incompatible bluetooth telephone ● Incorrect initial connection settings ● Electrical harness open/short circuit, dis-connected ● Component failure	GO to Pinpoint Test W.
'NAVIGATION NOT INSTALLED' message displayed	● No power or ground to navigation module ● Private CAN failure	Refer to the electrical circuit diagrams and check navigation module power and grounds, and private CAN circuit
'NO NAVIGATION AVAILABLE' message displayed	● GVIF fault ● Electrical harness short, open circuit	Carry out GVIF checks, refer to the electrical circuit diagrams and check electrical harness for short, open circuit

DTC index

• NOTE: If the control module is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval Program is in operation, prior to the installation of a new module.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give additional information read by the manufacturer approved diagnostic system).

• NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

DTC	Description	Possible Cause	Action
B100E25	Video Input "A"	● Input not connected (green connector) ● TV/DVD malfunction	Check the TV/DVD is connected (green connector). Check TV/DVD system for DTCs
B101025	Video Input "C"	● Input not connected ● Camera malfunction	Check that the camera is connected and operates correctly
B1A0049	Control module	● Touch screen display (TSD) internal electrical failure (can be set in more than one module) ● Amplifier internal electrical failure (can be set in more than one module)	Check the power and ground circuits to the module. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect. Check and install a new front touch screen display as required, refer to the new module/component installation note at the top of the DTC Index
B1A8911	Satellite Antenna	• NOTE: Navigation diagnostics Self Check code 80-3B ● GPS antenna circuit - short to ground ● GPS antenna failure ● Navigation module failure	Check for correct installation of GPS antenna. Refer to the electrical circuit diagrams and check GPS antenna circuit for short to ground. Check GPS antenna, install a new antenna as required. Check and install a new navigation module as required, refer to the new module/component installation note at the top of the DTC Index
B1A8913	Satellite Antenna	• NOTE: Navigation diagnostics Self Check code 80-3A ● Global positioning system (GPS) antenna high resistance - The co-axial connector can also set this code ● GPS antenna failure	Check for correct installation of GPS antenna. Refer to the electrical circuit diagrams and check GPS antenna circuit for open circuit. Check GPS antenna, install a new antenna as required
B1B0049	Sub-Module 'A'	• NOTE: Navigation diagnostics Self Check code 80-11, 58-02, 08-42, 08-43 ● Navigation module internal failure	Check for excessive temperature and for the correct installation of the navigation module. Install a new navigation module as required, refer to the new module/component installation note at the top of this DTC Index
B1D6249	Sub-Module 'B'	• NOTE: Navigation diagnostics Self Check code 32-4B ● Vehicle information and communication system (VICS) module internal electrical failure	Check the power and ground circuits to the module. Refer to the electrical guides. Check and install a new VICS module as required, refer to the new module/component installation note at the top of the DTC Index. Refer to the warranty policy and procedures manual if a module is suspect.
B1D6287	Sub-Module 'B'	• NOTE: Navigation diagnostics Self Check code 32-30 ● Vehicle information and communication system (VICS) module circuit - short to ground ● VICS module circuit - short to power ● VICS module circuit - high resistance ● VICS module disconnected	Refer to the electrical circuit diagrams and check VICS module circuits for short to ground, power, open circuit. Check and install a new VICS module as required, refer to the new module/component installation note at the top of the DTC Index. Configure the system using the approved diagnostic system.

DTC	Description	Possible Cause	Action
		• VICS module failure	
U1A0087	Medium Speed CAN Communication Bus	• NOTE: Navigation diagnostics Self Check code 01-50, 01-51, 30-28, 30-D2 • NOTE: 'NAVIGATION NOT INSTALLED' message is displayed • Navigation module disconnected • CAN fault between NAV module and TSD private CAN circuit • Private CAN circuit - short to ground, power, open circuit	Check the system connections at the display and the navigation module. Refer to the electrical circuit diagrams and check CAN private network for short, open circuit. Carry out CAN network integrity tests using the manufacturer approved diagnostic system. Refer to the Network Communications section of the workshop manual.
U1A0131	Communication Link	• NOTE: 'NO NAVIGATION AVAILABLE' message is displayed • Navigation module - touch screen display (TSD), gigabit video interface (GVIF) fault • GVIF disconnected • GVIF - short to ground, power, open circuit	Check for correct connection of GVIF circuit connectors. Refer to the electrical circuit diagrams and check the multi-media module GVIF circuits for short to ground, power, open circuit
U200531	Vehicle Speed	• Vehicle speed signal circuit between ABS and navigation system module - short, open circuit	Check 'SPD PULSE COUNT' in navigation diagnostics, vehicle signals screen. If count remains at zero, refer to the electrical guides and check vehicle speed signal circuit between the ABS module and navigation system module for short to ground, power or open circuit.
U300068	Control Module	• NOTE: Navigation diagnostics Self Check code 30-76 • Touch screen display (TSD) MOST fibre optic transceiver, over-temperature (greater than 85°C) • MOST transceiver over-temperature	An over-temperature message is displayed on the TSD before the information and entertainment system shuts down. Once the temperature is reduced the system will resume normal operation. If the system does not resume normal operation, check for DTCs indicating an information and entertainment fault. Refer to the electrical guides and check the power and ground circuits to the component. Check the MOST circuit. Carry out the general MOST test. Refer to the Network Communications section of the workshop manual and in the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.

Pinpoint Tests

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval Program is in operation, prior to the installation of a new module/component.

PINPOINT TEST A : BLANK SCREEN TESTS	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
A1: BLANK SCREEN TESTS	
	1 Check screen switch is not OFF.
	Is the screen turned OFF? **Yes** Turn screen switch 'ON'. Re-test vehicle. **No** GO to A2.
A2: PASSENGER COMPARTMENT TEMPERATURE CHECK	
	1 Check the passenger compartment temperature is not below -20°C.

	Is the passenger compartment below -20°C? **Yes** Raise the temperature in the passenger compartment. Re-test vehicle. **No** GO to A3.
A3: PASSENGER COMPARTMENT CONDENSATION CHECK	
	1 Check for condensation occurring inside the passenger compartment.
	Is condensation occurring inside the passenger compartment? **Yes** Dry out the passenger compartment, re-test the vehicle. **No** GO to A4.
A4: AUDIO POWER BUTTON CHECK (RANGE ROVER ONLY)	
	1 Check the status of the audio power button LED.
	Is the audio power button flashing? **Yes** Carry out MOST Ring diagnostics to locate fault. **No** GO to A5.
A5: NAVIGATION SCREEN CHECK	
	1 Check to see if only the navigation screen is blank.
	Is only the navigation screen blank? **Yes** GO to Pinpoint Test B. **No** GO to A6.
A6: AUDIO SCREEN CHECK (RANGE ROVER ONLY)	
	1 Check to see if only the audio screen is blank.
	Is only the audio screen blank? **Yes** GO to Pinpoint Test E. **No** GO to A7.
A7: TV/DVD CHECK	
	1 Check to see if only the TV/DVD is blank.
	Is only the TV/DVD screen blank? **Yes** GO to Pinpoint Test F. **No** GO to A8.
A8: HARNESS/CONNECTOR CHECKS	
	1 Check the display and power supply harness, power, auxiliary and ground circuits, for short, open circuits and are correctly connected.
	Was a fault identified with the display and power supply harness, power auxiliary and ground connections? **Yes** Rectify the fault and re-test the vehicle. **No** Install a new display screen. **module**

PINPOINT TEST B : NO DISPLAY ON NAVIGATION SCREEN (SCREEN DOES NOT CHANGE) TESTS

• NOTE: When re-confirming the symptoms after inspecting the wiring harness/connector, turn the ignition status to OFF, wait for the Audio power button LED on the display to turn OFF, then turn the ignition status to ON and run the diagnosis again from the beginning.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: SOFT KEY TEST	
	1 Check the navigation system soft key operation.
	Is operation normal when operating the soft key test? **Yes** GO to B2. **No** GO to Pinpoint Test M.
B2: HARD KEY TEST	
	1 Check the navigation system hard key operation.

	Is operation normal when pressing the navigation hard key? **Yes** GO to B3. **No** GO to Pinpoint Test C.
B3: DISPLAYED MESSAGE CHECK	
	1 Check for displayed messages.
	Are the 'No picture signal input', 'Navigation not installed' or 'No navigation available' messages being displayed? **Yes** GO to B4. **No** GO to Pinpoint Test A.
B4: NAVIGATION MODULE POWER AND GROUND CHECKS	
	1 Refer to electrical circuit diagrams and check integrity of power and ground wiring harness and connectors to navigation module.
	Was a fault identified with the navigation module power and ground harness or connections? **Yes** Rectify the fault and re-test the vehicle. **No** GO to B5.
B5: HARNESS/CONNECTOR CHECKS	
	1 Refer to the electrical circuit diagrams and check integrity of navigation module to display screen private CAN and GVIF harness and connections.
	Was a fault identified with the navigation module to display screen harness or connections? **Yes** Rectify the fault and re-test the vehicle. **No** Install a new navigation module. **module**

PINPOINT TEST C : HARD SWITCHES DO NOT RESPOND

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
C1: CHECK FOR FOREIGN OBJECTS	
	1 Check for foreign objects near to the button.
	Are there any foreign objects close to the button causing it to be pressed? **Yes** Remove foreign objects and re-test vehicle. **No** GO to C2.
C2: DISPLAY DIAGNOSTICS CHECK	
	1 Check to see if the display diagnostics can be displayed.
	Can the display diagnostics be displayed? **Yes** GO to C3. **No** GO to Pinpoint Test A. and GO to Pinpoint Test M.
C3: HARD KEY TEST	
	1 Carry out the display diagnostics hard key test.
	Is the operation normal when carrying out the display diagnostics hard key test? **Yes** System operation is normal. **No** Install a new display screen. **module**

PINPOINT TEST D : RADIO SCREEN WILL NOT DISPLAY (RANGE ROVER ONLY)

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
D1: AUDIO HARD SWITCH TEST	
	1 Check operation of audio hard switch.
	Does the audio screen display when the audio hard switch is pressed? **Yes** GO to D2. **No** Carry out hard switch tests. GO to Pinpoint Test C.
D2: AUDIO VIDEO SOFT KEY TEST	

	1 Check operation of the audio video soft key.
	Does the audio screen display when the audio video soft key on the 'Home Menu' screen is activated? **Yes** GO to D3. **No** Carry out touch switch tests. GO to Pinpoint Test M.
D3: RADIO SOFT KEY TEST	
	1 Check operation of the radio soft key.
	Does the radio soft key respond when touched? **Yes** Check the Integrated Head Unit (IHU). **No** Switch ignition status to OFF and wait thirty seconds for the display power LED to extinguish, then set ignition status to auxiliary. If fault still evident after re-test, check the Integrated Head Unit (IHU).

PINPOINT TEST E : CD SCREEN WILL NOT DISPLAY (RANGE ROVER ONLY)

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
E1: CD CHANGER CHECK	
	1 Check to see if a CD changer is installed.
	Is a CD changer installed? **Yes** GO to E2. **No** Normal operation, CD screen will not be displayed when there is no CD changer installed.
E2: AUDIO OPERATION SWITCH CHECK	
	1 Check the operation of the audio operation switch.
	Does the audio screen display when the audio operation switch is pressed? **Yes** GO to E3. **No** Carry out hard switch tests. GO to Pinpoint Test C.
E3: AUDIO VIDEO SOFT KEY TEST	
	1 Check operation of the audio video soft key.
	Does the audio screen display when the audio video soft key on the 'Home Menu' screen is activated? **Yes** GO to E4. **No** Carry out touch switch tests. GO to Pinpoint Test M.
E4: CD SOFT KEY TEST	
	1 Check operation of the CD soft key.
	Does the CD soft key respond when touched? **Yes** Check the Integrated Head Unit (IHU). **No** Switch ignition status to OFF and wait thirty seconds for the display power LED to extinguish, then set ignition status to auxiliary. If fault still evident after re-test, check the Integrated Head Unit (IHU).

PINPOINT TEST F : TV/DVD SCREEN WILL NOT DISPLAY

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
F1: TV/DVD CHECK	
	1 Check to see if TV/DVD is installed.
	Is TV/DVD installed? **Yes** GO to F2. **No** Normal operation, TV/DVD screen will not be displayed when there is no TV/DVD installed.
F2: AUDIO OPERATION HARD KEY TEST (RANGE ROVER ONLY)	
	1 Check the operation of the audio hard key.
	Does the audio screen display when the audio hard key is pressed? **Yes** GO to F3. **No** Carry out hard switch tests. GO to Pinpoint Test C.

F3: AUDIO VIDEO SOFT KEY TEST (RANGE ROVER ONLY)	
	1 Check operation of the audio video soft key.
	Does the audio screen display when the audio video soft key on the 'Home Menu' screen is activated? **Yes** GO to F4. **No** Carry out touch switch tests. GO to Pinpoint Test M.
F4: TV/DVD SOFT KEY TEST	
	1 Check operation of the TV/DVD soft key.
	Does the TV/DVD soft key respond when touched? **Yes** Check the Integrated Head Unit (IHU). **No** Switch ignition status to OFF and wait thirty seconds for the display power LED to extinguish, then set ignition status to auxiliary. If fault still evident after re-test, check the Integrated Head Unit (IHU).

PINPOINT TEST G : AUX. SCREEN WILL NOT DISPLAY

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
G1: AUDIO OPERATION SWITCH CHECK	
	1 Check the operation of the audio operation switch.
	Does the audio screen display when the audio operation switch is pressed? **Yes** GO to F3. **No** Carry out hard switch tests. GO to Pinpoint Test C.
G2: AUDIO VIDEO SOFT KEY TEST	
	1 Check operation of the audio video soft key.
	Does the audio screen display when the audio video soft key on the 'Home Menu' screen is activated? **Yes** GO to F4. **No** Carry out touch switch tests. GO to Pinpoint Test M.
G3: TV/DVD SOFT KEY TEST	
	1 Check operation of the TV/DVD soft key.
	Does the TV/DVD soft key respond when touched? **Yes** Check the Integrated Head Unit (IHU). **No** Switch ignition status to OFF and wait thirty seconds for the display power LED to extinguish, then set ignition status to auxiliary. If fault still evident after re-test, check the Integrated Head Unit (IHU).

PINPOINT TEST H : DISPLAY SCREEN WILL NOT SWITCH TO LOW LIGHT

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
H1: CHECK FOR FOREIGN OBJECTS	
	1 Check for foreign objects adhered to the display light sensor. ● Range Rover - Top right of display ● Discovery/Range Rover Sport - Instrument panel
	Are there any foreign objects adhered to the display light sensor? **Yes** Remove foreign objects and re-test vehicle. **No** GO to H2.
H2: VEHICLE LIGHT SWITCH TESTS	
	1 Check to see if display screen switches to low light when the vehicle light switch is pressed.
	Does the display screen switch to low light when the vehicle light switch is pressed? **Yes** Operation is normal. **No** GO to H3.
H3: DISPLAY LIGHT SENSOR CHECK	
	1 Check to see if display screen switches to low light when sensor is covered.

	Does the display screen switch to low light when the sensor is covered? **Yes** Operation is normal. **No** Range Rover Only - Install a new display screen. **module** Discovery/Range Rover Sport - Check CAN network between instrument cluster and display screen. If no fault evident, install a new instrument cluster. **module**

PINPOINT TEST I : NOISE INTERFERES ON EACH SCREEN AND THE COLORS ARE ABNORMAL	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
I1: DISPLAY POWER AND GROUND CHECKS	
	1 Refer to electrical circuit diagrams and check battery power and power ON relay voltage, and ground resistance.
	Is the battery power and power ON relay voltage between 10.5 and 16 volts, and continuity to ground? **Yes** GO to I2. **No** Check and rectify the vehicle wiring harness and connectors.
I2: CONTRAST CHECK	
	1 Check to see if the screen color is normal when the screen setting (contrast) is re-ret to the default values.
	Is the screen color normal with the default values? **Yes** Normal operation. **No** GO to I3.
I3: CABIN INTERNAL TEMPERATURE CHECK	
	1 Check the cabin internal temperature.
	Is the cabin internal temperature -20°C or lower? **Yes** Raise the cabin internal temperature and re-test. **No** GO to I4.
I4: ADDITIONAL SCREEN CHECKS	
	1 Check all other screens.
	Are all other screens beside the navigation display screen normal? **Yes** Go to screen color is abnormal. GO to Pinpoint Test K. **No** GO to I5.
I5: RGB COLOR TEST	
	1 Carry out the display diagnostics RGB color test.
	Are the results of the display diagnostics RGB test normal? **Yes** Normal operation. **No** GO to Pinpoint Test K.

PINPOINT TEST J : DISTURBANCE ON SCREEN (SYNCHRONIZATION ABNORMAL)	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
J1: AUDIO SCREEN SYNCHRONIZATION CHECK (RANGE ROVER ONLY)	
	1 Check the audio screen synchronization.
	Is the audio screen synchronization normal? **Yes** GO to J2. **No** Check the integrated head unit and connections.
J2: NAVIGATION SCREEN SYNCHRONIZATION CHECK	
	1 Check the navigation screen (map screen) synchronization.
	Is the navigation screen (map screen) synchronization normal? **Yes** GO to J4. **No** Check the GVIF circuits between the navigation module and display screen.

J3: WIRING HARNESS AND CONNECTOR CHECKS	
	1 Check the integrity of the display screen wiring harness and connections.
	Was a fault identified with the display screen wiring harness or connections? **Yes** Rectify the fault and re-test. **No** GO to J4.
J4: TV/DVD SCREEN SYNCHRONIZATION CHECK	
	1 Check the TV screen synchronization.
	Is the TV screen synchronization normal? **Yes** GO to J6. **No** GO to J5.
J5: CHECK TV/DVD SETTINGS	
	1 Check TV settings are to the correct TV standards for the country.
	Are the TV settings to the correct TV standards for the country? **Yes** Check TV tuner module and/or DVD module. **No** Re-set TV settings and re-test vehicle.
J6: REAR VIEW CAMERA SCREEN SYNCHRONIZATION CHECK	
	1 Check the rear view camera screen synchronization.
	Is the rear view camera screen synchronization normal? **Yes** Normal operation, re-test vehicle. **No** Check the integrity of the rear view camera.

PINPOINT TEST K : SCREEN COLOR IS ABNORMAL

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
K1: NAVIGATION SYSTEM DISPLAY MODULE RGB COLOR TEST	
	1 Carry out the display diagnostics RGB color test.
	Are the results of the display diagnostics RGB test normal? **Yes** GO to Pinpoint Test I. **No** GO to K2.
K2: CONTRAST SETTING CHECKS	
	1 Re-set the contrast settings to the default values.
	Is the color normal after re-setting contrast to default values? **Yes** Normal operation, re-test vehicle. **No** Install a new display screen. **module**
K3: NAVIGATION MODULE RGB COLOR TEST	
	1 Carry out the navigation module diagnostics RGB color bar test.
	Is the color normal during the diagnostic color bar test? **Yes** Normal operation. **No** GO to K4.
K4: NAVIGATION MODULE POWER AND GROUND CHECKS	
	1 Refer to the electrical circuit diagrams and check the navigation module power and ground circuits.
	Has a fault been identified with the navigation module power or grounds? **Yes** Rectify the fault and re-test vehicle. **No** GO to K5.
K5: HARNESS/CONNECTOR CHECKS	
	1 Refer to the electrical circuit diagrams and check integrity of navigation module to display screen harness and connections.

	Was a fault identified with the navigation module to display screen harness or connections? **Yes** Rectify the fault and re-test the vehicle. **No** Install a new navigation module. **module**

PINPOINT TEST L : MAP DISC WILL NOT INSERT/EJECT	
• NOTE: Ensure the parking brake is applied, and ignition status is set to Auxiliary or ON.	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
L1: MAP DISC CHECK	
	1 Check to see if there is a map disc inserted into the navigation module.
	2 Check map disc for contamination, deformation, cracks, scratches or non-genuine disc.
	Has a fault been identified with the map disc? **Yes** Replace the map disc. **No** GO to L2.
L2: HARNESS/CONNECTOR CHECKS	
	1 Refer to the electrical circuit diagrams and check integrity of navigation module power and ground supply harness and connections.
	Has a fault been identified with the navigation module power and ground supply harness or connections? **Yes** Rectify the fault and re-test the vehicle. **No** Install a new navigation module. **module**

PINPOINT TEST M : TOUCH SWITCHES DO NOT RESPOND	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
M1: START CALIBRATION ROUTINE	
	1 Carry out the start calibration routine from the display diagnostics touch switch test.
	Is normal operation resumed after correction? **Yes** Normal operation. **No** GO to M2.
M2: TOUCH SWITCH TEST	
	1 Carry out the touch switch test in the display diagnostics.
	Are the touch switches not responding on the navigation screen only? **Yes** GO to M3. **No** Install a new display screen. **module**
M3: HARNESS/CONNECTOR CHECKS	
	1 Refer to the electrical circuit diagrams and check integrity of navigation module to display screen harness and connections.
	Has a fault been identified with the navigation module to display screen harness or connections? **Yes** Rectify the fault and re-test the vehicle. **No** Install a new navigation module. **module**

PINPOINT TEST N : CONSIDERABLE DEVIATION BETWEEN DISPLAYED VEHICLE POSITION AND ACTUAL POSITION	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
N1: GPS MARK DISPLAY CHECK	
	1 Check to see if GPS mark is displayed.
	Is the GPS mark displayed on the display screen? **Yes** GO to N2. **No** Refer to GPS mark does not appear diagnosis. GO to Pinpoint Test O.
N2: LOCATION CHECK	

	1 Check for symptom occurring in particular locations - parallel roads, elevated roads, loop roads, parking centers (buildings) etc.
	Does the symptom occur in a particular location? **Yes** In places where the vehicle position is hard to specify, the vehicle position may be matched incorrectly and result in position discrepancies. Additionally, a new road layout will mean the Gyro does not match the map position. **No** GO to N3.
N3: DISTANCE CORRECTION CHECK	
	1 Check to see if distance correction is being performed.
	Is distance correction being performed? **Yes** Monitor the condition until distance correction is complete (drive for over 10km/6.2 miles) **No** GO to N4.
N4: DIAGNOSTIC CODE CHECK	
	1 Check navigation diagnostic codes.
	Is logical address '80' being displayed? **Yes** Check the GPS antenna circuit for short, open circuit. Check and install GPS antenna and navigation module as required, refer to the new module/component installation note at the top of the Pinpoint Test section. **No** GO to N5.
N5: VEHICLE SIGNAL INSPECTION	
	1 Check the vehicle speed signal (SPD) during the vehicle signal inspection test.
	Is the SPD signal normal? **Yes** GO to N6. **No** Refer to the electrical circuit diagrams and check the integrity of the wiring harness and connectors to the navigation module.
N6: REVERSE SIGNAL CHECKS	
	1 Check navigation diagnostics, vehicle signals screen, to see if REV: ON is indicated when the gear shift lever is in the REV position.
	Is REV: ON indicated? **Yes** GO to N7. **No** Refer to the electrical circuit diagrams and check the integrity of the wiring harness and connectors, and CAN circuit, to the navigation module.
N7: TIRE CHECK	
	1 Check to see if new tires have recently been installed.
	Have new tires been recently installed? **Yes** Perform automatic correction by pressing 'various settings' on the menu screen, then 'navigation correction' and 'distance correction'. Drive vehicle at 10-20km/h to confirm. **No** Correct the current location, and drive for a while with GPS mark displayed to monitor conditions. If fault still apparent, GO to Pinpoint Test O.

PINPOINT TEST O : GPS MARK DOES NOT APPEAR

- NOTE: Move the vehicle to an open area, radio waves from satellites may not be received inside buildings.
- NOTE: Correct the vehicle cursor to the current location.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
O1: RETRO-INSTALL INSTALLATIONS CHECK	
	1 Check to see if there are any retro-install installations (anti-theft, radar, etc.)
	Are there any retro-install installations? **Yes** GO to O2. **No** GO to O3.
O2: RETRO-INSTALL INSTALLATIONS RF CHECK	
	1 Turn power supply (including back-up power) to OFF status.

	Is the GPS mark displayed? **Yes** GPS reception may deteriorate when devices receiving radio waves are retro-installed. Alter the position of the retro-install device, and re-test vehicle. **No** GO to O3.
O3: SATELLITE RECEPTION CHECKS	
	1 Check to see if a 'P' or 'T' is displayed in the 'ST' column of the navigation diagnostics GPS information screen after 10 minutes have passed.
	Is a 'P' or a 'T' displayed? **Yes** Wait for reception of another satellite so that position calculation can be performed. **No** GO to O4.
O4: NAVIGATION DIAGNOSTICS SELF CHECK CODES	
• NOTE: Confirm the GPS antenna is connected to the navigation module.	
	1 Perform the navigation diagnostics 'Self Check'.
	Are either of the codes 80-3A or 80-3B displayed? **Yes** GO to O5. **No** If the code 80-11 is displayed or no 80-XX code is logged, install a new navigation module. **module**
O5: GPS ANTENNA REPLACEMENT	
	1 Install a new GPS antenna.
	Is reception possible after the GPS antenna has been replaced? **Yes** Fault has been rectified. **No** Refer to the electrical circuit wiring diagrams and check the integrity of the wiring harness and connectors to the GPS antenna.

PINPOINT TEST P : NO SOUND

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
P1: SOUND OUTPUT CHECK	
	1 Check sound output across all systems.
	Is there no sound output across all systems? **Yes** GO to P2. **No** GO to P3.
P2: VOLUME LEVEL CHECK	
	1 Check the volume level is not set too low.
	Is the volume level set too low? **Yes** Increase the volume level and re-test vehicle. **No** Refer to the electrical circuit diagrams and check integrity of amplifier and speaker wiring harness and connections. Check the Integrated Head Unit (IHU).
P3: ONLY VOICE GUIDANCE DOES NOT OUTPUT	
	1 Check that only voice guidance does not output.
	Is there no output only from the voice guidance? **Yes** GO to P4. **No** GO to P7.
P4: NAVIGATION VOLUME SETTING	
	1 Check to see if the navigation system volume setting is too low.
	Is the navigation volume setting too low? **Yes** Increase the navigation volume level and re-test the vehicle. **No** GO to P5.
P5: VOICE GUIDANCE	
	1 Check to see if the voice guidance is set to 'OFF' in the navigation settings.

	Is the voice guidance set to 'OFF' in the navigation settings? **Yes** Set to 'ON' and re-test the vehicle. **No** GO to P6.
P6: ADDITIONAL ITEMS	
	1 Check to see if the following items apply. ● There is no destination set ● There is no movement along the route
	Do the two items apply? **Yes** Normal operation, confirm customer symptom and re-test vehicle. **No** Check MOST connection at the Touch Screen Display and check the Integrated Head Unit (IHU).
P7: ONLY VOICE RECOGNITION DOES NOT OUTPUT	
	1 Check to see if only voice recognition does not output.
	Is there no output only from the voice recognition? **Yes** Carry out the 'No voice recognition' diagnostics. GO to Pinpoint Test Q. **No** GO to P8.
P8: ONLY CD DOES NOT OUTPUT	
	1 Check to see if only the CD does not output.
	Does only the CD not output? **Yes** If the playtime is advancing, check the Integrated Head Unit (IHU). If the playtime is not advancing, press Start/Play. **No** GO to P9.
P9: ONLY THE RADIO DOES NOT OUTPUT	
	1 Check to see if only the radio does not output.
	Does only the radio not output? **Yes** Check the Integrated Head Unit (IHU). **No** GO to P10.
P10: ONLY TV SOUND DOES NOT OUTPUT	
	1 Check to see if only the TV sound does not output.
	Does only the TV sound not output? **Yes** Check the Integrated Head Unit (IHU). **No** GO to P11.
P11: ONLY TELEPHONE SOUND DOES NOT OUTPUT	
	1 Check to see if only the telephone sound does not output.
	Does only the telephone sound not output? **Yes** Check the Integrated Head Unit (IHU). For additional information. GO to Pinpoint Test W. **No** Check the Integrated Head Unit (IHU).

PINPOINT TEST Q : NO VOICE RECOGNITION

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
Q1: MAP DISC CHECK	
	1 Check to see if the map disc is inserted.
	Is the map disc inserted? **Yes** GO to Q2. **No** Insert the map disc.
Q2: AUDIO SOUND IS MUTED WHEN PTT SWITCH IS DEPRESSED	
	1 Check to see if the audio sound is muted when the PTT switch is depressed.

	Is the audio sound muted? **Yes** GO to Q4. **No** GO to Q3.
Q3: PTT SWITCH STATUS	
	1 Check to see if the PTT switch status is ok in the navigation diagnostics, manual check, microphone test.
	Is the PTT switch status, in navigation diagnostics, ok? **Yes** Check the Integrated Head Unit (IHU). **No** Install a new Integrated Head Unit (IHU), or Ignition Gateway Module.
Q4: TALK BACK	
	1 Check to see if there is talk back when other voice recognition demands are executed.
	Is there talk back? **Yes** System operation is normal, (advise change in manner of speech, as incorrect recognition is occurring). **No** GO to Q5.
Q5: MICROPHONE TEST	
	1 Check to see if the microphone level changes when speaking into the microphone during test in navigation diagnostics, manual checks, microphone test.
	Does the microphone level change when talking after pressing the PTT switch? **Yes** System operation is normal, (advise change in manner of speech, as incorrect recognition is occurring). **No** Refer to the electrical circuit diagrams and check integrity of microphone circuit GO to Q6. . If no fault is evident, suspect the microphone, check and install a new microphone as required.
Q6: HARNESS/CONNECTOR CHECKS	
	1 Refer to the electrical circuit diagrams and check integrity of navigation module to display screen harness and connections.
	Has a fault been identified with the navigation module to display screen harness or connections? **Yes** Rectify the fault and re-test the vehicle. **No** Install a new navigation module. **module**

PINPOINT TEST R : VEHICLE CURRENT POSITION MARK TURNS ON ITS OWN

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
R1: VEHICLES CURRENT POSITION MARK TURNS ON ITS OWN	
	1 Determine if the ignition status was turned to Auxiliary or On, while the vehicle was on a turntable in a parking building etc.
	Was ignition status set to Auxiliary or On? **Yes** The angular speed of the vehicle at the time of the ignition status change will be logged as the standard value. To re-set the standard value, turn ignition status to 'OFF' then to 'Auxiliary' or 'On' with the vehicle stationary. Re-test the vehicle. **No** GO to R2.
R2: VEHICLES CURRENT POSITION MARK TURNS ON ITS OWN	
	1 Check for logged fault codes in navigation diagnostics.
	Is the fault code 58-02 (Gyro system) logged? **Yes** Install a new navigation module. **module** **No** GO to R3.
R3: VEHICLES CURRENT POSITION MARK TURNS ON ITS OWN	
	1 Check for logged fault codes in navigation diagnostics.
	Is the fault code 58-03 (vehicle speed system) logged? **Yes** Take measures in accordance with navigation DTC index. **No** Install a new navigation module. **module**

PINPOINT TEST S : VEHICLE POSITION DOES NOT UPDATE	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
S1: VEHICLE POSITION DOES NOT UPDATE	
	1 Check the GPS mark display.
	Does the GPS mark display? **Yes** GO to S2. **No** Carry out the GPS mark display diagnostics. GO to Pinpoint Test O.
S2: VEHICLE POSITION DOES NOT UPDATE	
	1 Check the map screen scroll function.
	Can the map screen be touched scrolled? **Yes** GO to S3. **No** Check the condition of the map disc (scratches, contamination, deformation, cracks, non-genuine disc etc.).
S3: VEHICLE POSITION DOES NOT UPDATE	
	1 Go to vehicle signal check screen in display diagnostics.
	Is the vehicle speed input correctly? Note: MOST and navigation system module speeds are approximately the same. **Yes** Suspect the navigation module. Refer to the new module/component installation note at the top of this section. **No** GO to S4.
S4: HARNESS/CONNECTOR CHECKS	
	1 Refer to the electrical circuit diagrams and check integrity of navigation module harness and connections.
	Has a fault been identified with the navigation module harness or connections? **Yes** Rectify the fault and re-test the vehicle. **No** Install a new navigation module. **module**

PINPOINT TEST T : ROUTE CALCULATIONS CANNOT BE PERFORMED	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
T1: ROUTE CALCULATIONS CANNOT BE PERFORMED	
	1 Check to see if route calculations are possible when the current location is correct and a different destination is set.
	Are route calculations possible? **Yes** GO to T2. **No** Check the condition of the map disc (scratches, contamination, deformation, cracks, non-genuine disc etc.).
T2: ROUTE CALCULATIONS CANNOT BE PERFORMED	
	1 Check to see if a point of interest search can be performed.
	Can a point of interest search can be performed? **Yes** GO to T3. **No** Check the condition of the map disc (scratches, contamination, deformation, cracks, non-genuine disc etc.).
T3: ROUTE CALCULATIONS CANNOT BE PERFORMED	
	1 Check to see if the map screen can be touch scrolled.
	Can the map screen be touched scrolled? **Yes** Check the condition of the map disc (scratches, contamination, deformation, cracks etc.). If no fault is evident, suspect the navigation module. Refer to the new module/component installation note at the top of this section. **No** Check the condition of the map disc (scratches, contamination, deformation, cracks, non-genuine disc

	etc.).

PINPOINT TEST U : MAP DISPLAY IS INCOMPLETE	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
U1: MAP DISPLAY IS INCOMPLETE	
	1 Check to see if the map screen displays correctly when it is touch scrolled.
	Does the map screen display correctly when it is touch scrolled? **Yes** Check the condition of the map disc (scratches, contamination, deformation, cracks, non-genuine disc etc.). **No** GO to U2.
U2: MAP DISPLAY IS INCOMPLETE	
	1 Check to see if the map screen scale can be reduced.
	Can the map screen scale be reduced? **Yes** GO to U3. **No** Check the condition of the map disc (scratches, contamination, deformation, cracks, non-genuine disc etc.).
U3: MAP DISPLAY IS INCOMPLETE	
	1 Check to see if a point of interest search can be performed.
	Can a point of interest search be performed? **Yes** GO to U4. **No** Check the condition of the map disc (scratches, contamination, deformation, cracks, non-genuine disc etc.).
U4: MAP DISPLAY IS INCOMPLETE	
	1 Replace the map disc and re-test vehicle.
	Is the fault still apparent? **Yes** Suspect the navigation module. Refer to the new module/component installation note at the top of this section. **No** Normal operation.

PINPOINT TEST V : VEHICLE POSITION MARK MOVES IN THE OPPOSITE DIRECTION TO THE DIRECTION OF TRAVEL	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
V1: REAR VIEW CAMERA DISPLAY CHECK	
	1 Check to see if the rear view camera is operational when reverse gear is selected.
	Is the rear view camera operational when reverse gear is selected? **Yes** GO to V2. **No** Refer to the electrical circuit diagrams and check integrity of back monitor display wiring harness and connectors. Check the Integrated Head Unit (IHU).
V2: REV 'ON' SIGNAL CHECK	
	1 Carry out the vehicle signal check in navigation diagnostics.
	Is the REV 'ON' signal displayed correctly when the gear shift selector is in reverse? **Yes** GO to V3. **No** Refer to electrical circuit diagrams and check integrity of navigation system wiring harness and connectors. If fault still evident, suspect the navigation module. Refer to the new module/component installation note at the top of this section.
V3: HARNESS/CONNECTOR CHECKS	
	1 Refer to the electrical circuit diagrams and check integrity of navigation module harness and connections.
	Has a fault been identified with the navigation module harness or connections? **Yes** Rectify the fault and re-test the vehicle. **No**

	Check the Integrated Head Unit (IHU).

PINPOINT TEST W : CANNOT MAKE OR RECEIVE CALLS WITH THE BLUETOOTH TELEPHONE - CANNOT CONNECT TO THE VEHICLE

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
W1: DISPLAY CHECK (RANGE ROVER ONLY)	
	1 Press the telephone button.
	Is 'Telephone not connected' displayed on the screen? **Yes** GO to W2. **No** GO to W7.
W2: BLUETOOTH COMPATIBILITY CHECK	
	1 Check to see if the telephone handset is Bluetooth compatible.
	Is the telephone handset Bluetooth compatible? **Yes** GO to W3. **No** Use a Bluetooth compatible telephone handset.
W3: HANDSET POWER CHECK	
	1 Check to see if the handset is switched 'ON'.
	Is the telephone handset switched 'ON'? **Yes** GO to W4. **No** Switch handset 'ON' and re-test.
W4: INITIAL CONNECTION SETTINGS	
	1 Check to see if the initial connection settings to the in-vehicle system have been performed.
	Have the initial connection settings to the in-vehicle system been performed? **Yes** GO to W5. **No** Perform the initial connection settings.
W5: HANDSET COMMUNICATION CHECK	
	1 Check to see if the telephone handset recognizes the in-vehicle system.
	Does the telephone handset recognize the in-vehicle system? **Yes** GO to W6. **No** Re-test using a different Bluetooth compatible telephone handset. If the fault is still evident, suspect the telephone module. Refer to the new module/component installation note at the top of this procedure.
W6: HANDSET COMMUNICATION CHECK	
	1 Switch the Bluetooth telephone handset 'OFF' then back 'ON' again.
	Does the telephone handset recognize the in-vehicle system? **Yes** Check the Integrated Head Unit (IHU). **No** Suspect the telephone module. Refer to the new module/component installation note at the top of this procedure.
W7: HANDSET COMMUNICATION CHECK	
	1 Check to see if the telephone is within communications range.
	Is the telephone within a 10 meter range of the bluetooth telephone module? **Yes** GO to W8. **No** Move the telephone handset to within a 10 meter range of the bluetooth telephone module.
W8: HANDSET COMMUNICATION CHECK	
	1 Check to see if when transmitting, the telephone handset is also receiving.
	When transmitting, is the telephone handset also receiving? **Yes** Check the Integrated Head Unit (IHU). **No** Replace the telephone handset.

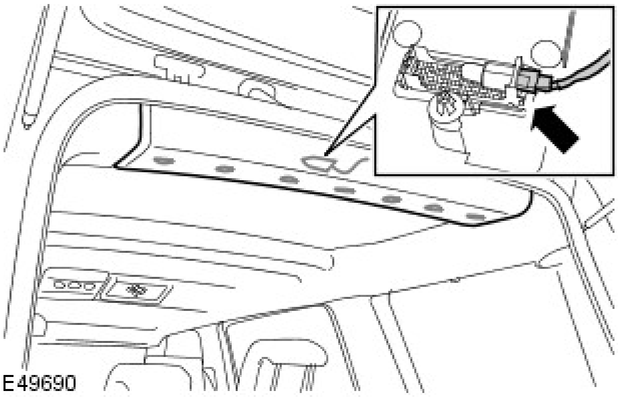
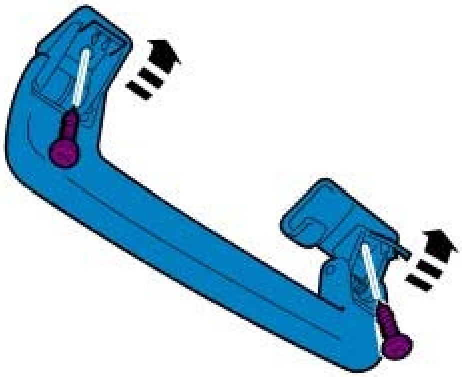
Navigation System - Navigation System Antenna

Removal and Installation

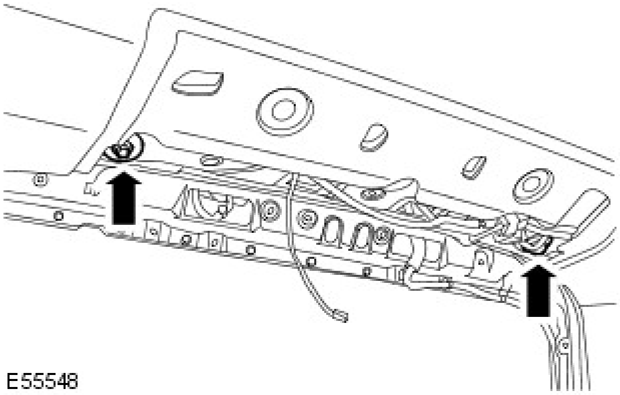
Removal



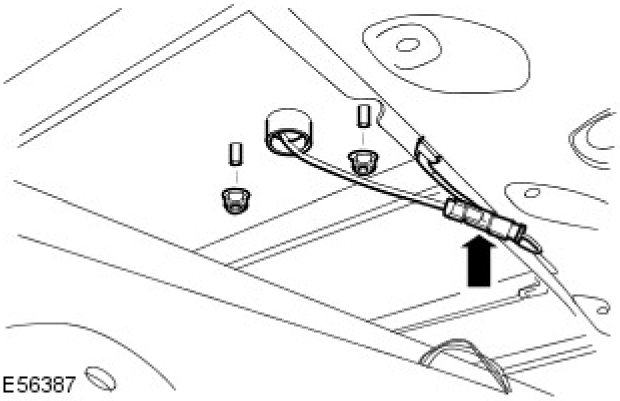
1. Remove the rear headliner trim panel.
    - Release the 7 clips.
    - Disconnect the interior light electrical connector.



2. If installed remove the LH third row seat passenger assist handle.
    - Carefully release the screw covers.
    - Remove the 2 screws.
3. If installed, remove the RH third row seat passenger assist handle.
    - Carefully release the screw covers.
    - Remove the 2 screws.



4. Release the rear of the headliner.
    - Release the 2 clips.



5. Remove the navigation system antenna.

- Disconnect the electrical connector.
- Remove the 2 nuts.

Installation

1. Install the navigation system antenna.

- Tighten the nuts to 10 Nm (7 lb.ft).
- Connect the electrical connector.

2. Attach the rear of the headliner.

- Secure with the clips.

3. Install the RH third row seat passenger assist handle, if installed.

- Tighten the screws.
- Attach the covers.

4. Install the LH third row seat passenger assist handle, if installed.

- Tighten the screws.
- Attach the covers.

5. Install the rear headliner trim panel.

- Secure in the clips.
- Connect the electrical connector.

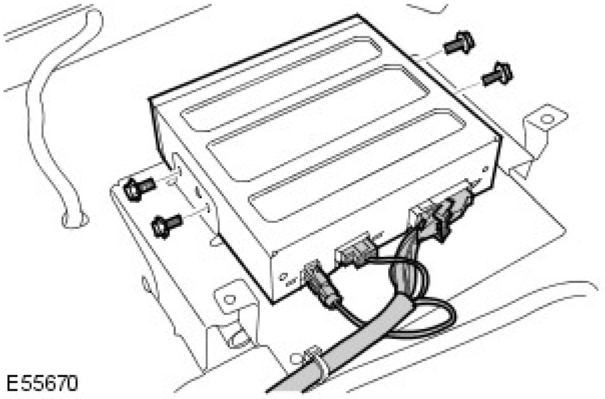
Navigation System - Navigation System Compact Disc (CD) Unit

Removal and Installation

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Make the SRS system safe.
   For additional information, refer to: Standard Workshop Practices (100-00 General Information, Description and Operation).
3. Remove the LH front seat.
   For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).
4. Remove the CD unit.



- Remove the 4 bolts.
- Disconnect the antenna cable.
- Disconnect the 2 electrical connectors.

Installation

1. Install the CD unit.
   - Tighten the bolts to 6 Nm (4 lb.ft).
   - Connect the electrical connectors.
   - Connect the antenna cable.
2. Install the LH front seat.
   For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).
3. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Published: 11-May-2011

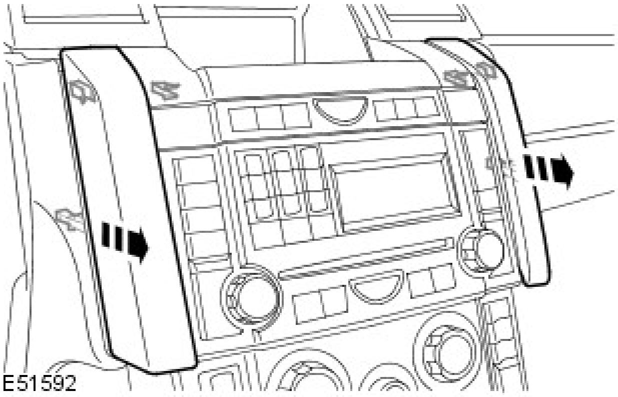
Navigation System - Navigation System Display Module

Removal and Installation

Removal

1. ⚠ CAUTION: After switching of the ignition, wait for 2 minutes before disconnecting the battery. Failure to wait for 2 minutes will damage the navigation computer.

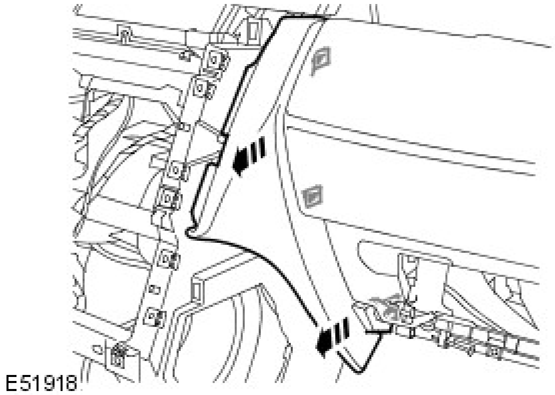
Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).



E51592

2. Remove the audio unit side trim panels.

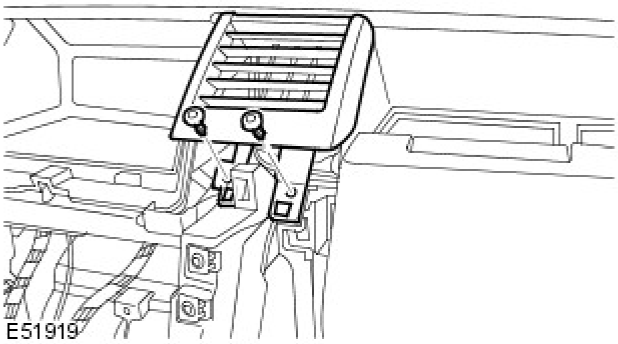
- Release the 6 clips.



E51918

3. Remove the instrument panel center reinforcement trim panel.

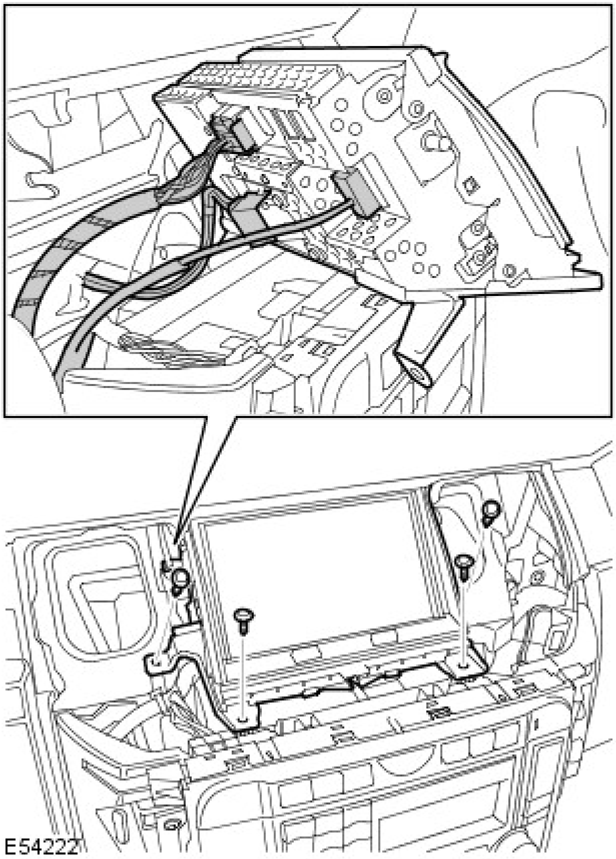
- Release the 3 clips.
- Repeat the above procedure for the other side.



E51919

4. Remove the center face level vent.

- Remove the 2 Torx screws.
- Repeat the above procedure for the other side.



5. ⚠ CAUTION: Cover fibre optic cable connectors to minimise dust ingress and avoid bending the cables in a radius of less than 30 mm.

Remove the navigation system display module.

- Remove the 4 screws.
- Disconnect the fibre optic connector.
- Disconnect the 2 electrical connectors.

Installation

1. Install the navigation system display module.

- Connect the electrical connectors.
- Connect the fibre optic connector.
- Tighten the screws.

2. Install the center face level vents.

- Tighten the Torx screws.

3. Install the instrument panel center reinforcement trim panels.

- Secure the clips.

4. Install the audio unit side trim panels.

- Secure the clips.

5. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

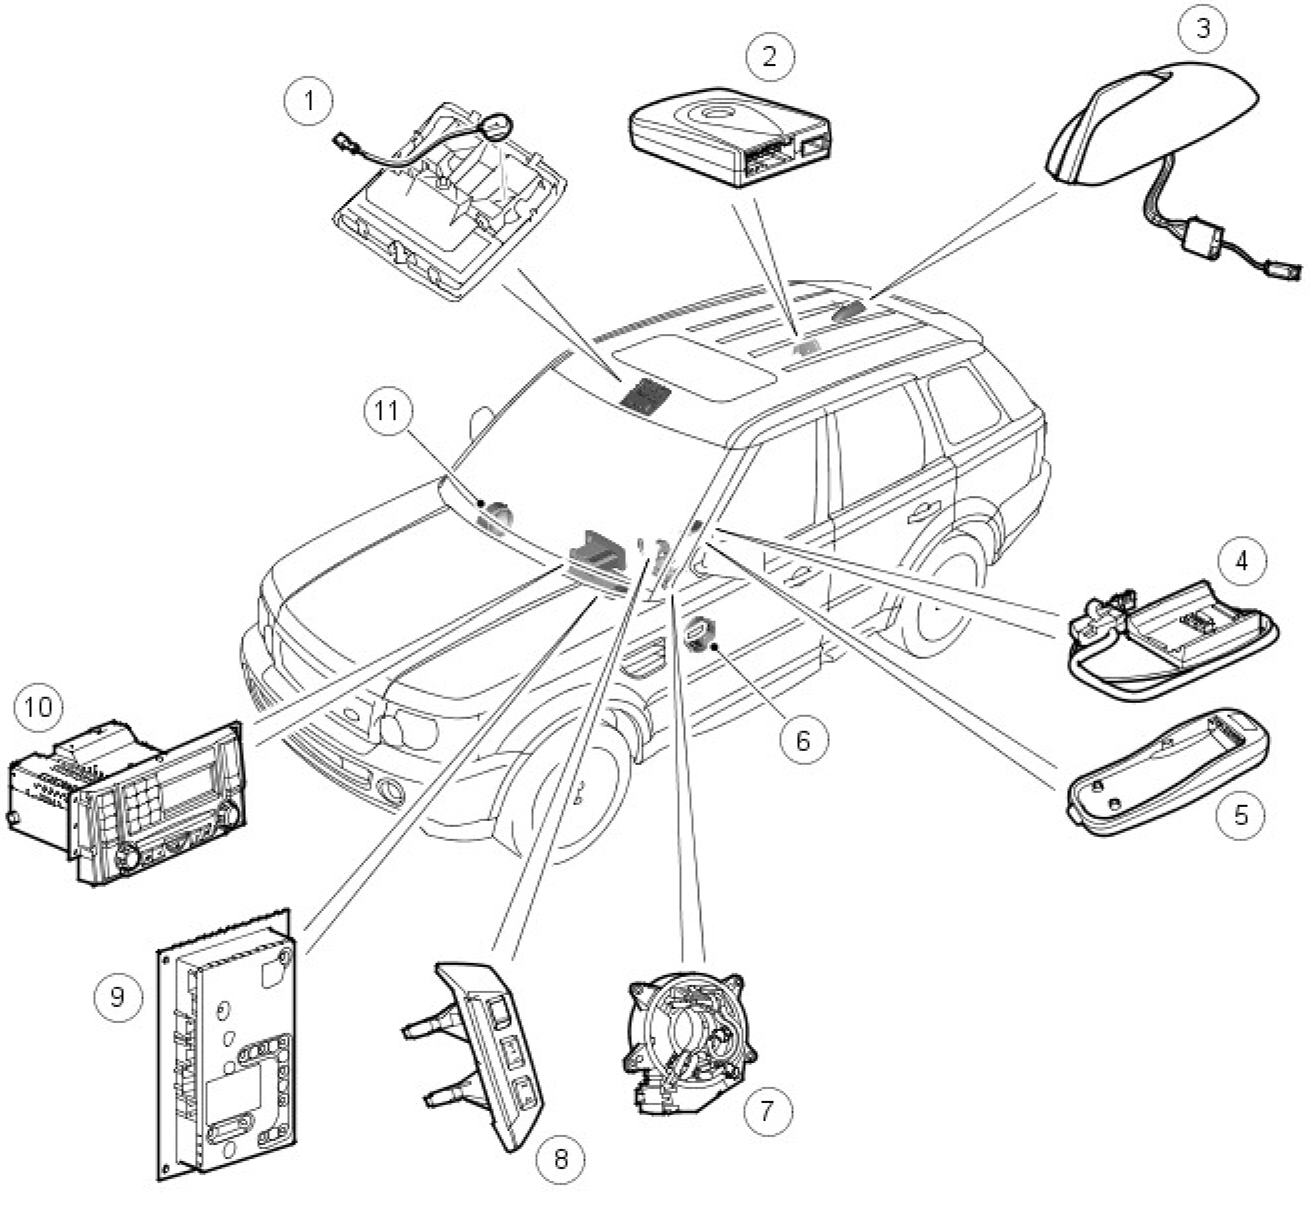
Cellular Phone - Cellular Phone

Description and Operation

CELLULAR PHONE SYSTEM (up to 2009 MY)

Cellular Phone Component Location (up to 2009 MY)



E57110

Item	Part Number	Description
1	-	Microphone
2	-	Transceiver Module (TM)
3	-	Cellular Phone Antenna
4	-	Base plate adaptor
5	-	Adaptor cradle
6	-	Speaker
7	-	Clock spring
8	-	Steering wheel switches

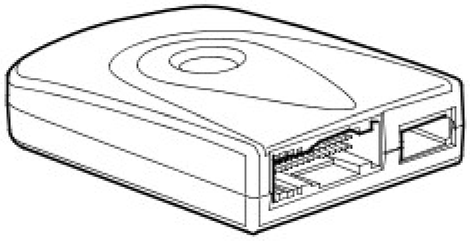
9	-	Amplifier
10	-	Integrated Head Unit (IHU)
11	-	Speakers

The cellular phone system comprises:

- Transceiver Module (TM)
- Base plate adaptor
- Telephone cradle
- Microphone
- Cellular Phone Antenna.

The telephone system fitted to the vehicle allows the driver to dock their own handset to the vehicle hands free telephone system. This is achieved using an adaptor cradle which is telephone specific. This cradle is mated to a standard baseplate which in turn is connected to the TM. The TM is connected to the MOST ring for communication with the rest of the system.
For additional information, refer to: Communications Network (418-00 Module Communications Network, Description and Operation).

Transceiver Module



E48172

The Transceiver Module (TM) is located in the rear right-hand (RH) quarter of the luggage compartment. The TM is the interface between the telephone and the Integrated Head Unit (IHU). The TM also contains the telephone voice recognition hardware and software.

Transceiver Module Connector Pin Out C2777

Pin No	Description	Input/Output
1 to 15	Not Used	-
16	Ignition	Input
17	Battery voltage	Input
18	Battery voltage	Input
19 to 32	Not Used	-
33	ground (GND)	-

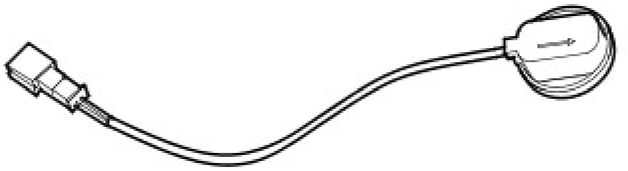
37	Cellular phone ear piece +	Output
38	Cellular phone ear piece -	-
39	Cellular phone Mic piece +	Input
40	Cellular phone Mic. piece -	-
41	Wake up signal (non Nokia phone in cradle)	Input
42	Wake up signal (Nokia phone in cradle)	Input
43	Not Used	-
44	Not Used	-
45	Transmit/receive to phone	Input/Output
46	Shield ground	-
47	Serial transmission + (Nokia F bus)	Output
48	Serial transmission - (Nokia F bus)	-
49	Serial receive + (Nokia F bus)	Input
50	Serial receive - (Nokia F bus)	-
51	Cradle ID signal	Input
52	Cradle voltage supply	Input

Pin No	Description	Input/Output
53	Phone charge ground	-
54	Battery charging voltage	Output

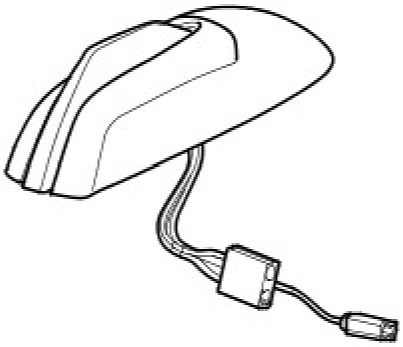
Microphone



E48173

A single microphone is used for hands-free telephone operation and for the voice recognition system. The microphone has an integrated noise suppression system for hands-free telephone use. The microphone is a standard directional type and is located in the front roof console.

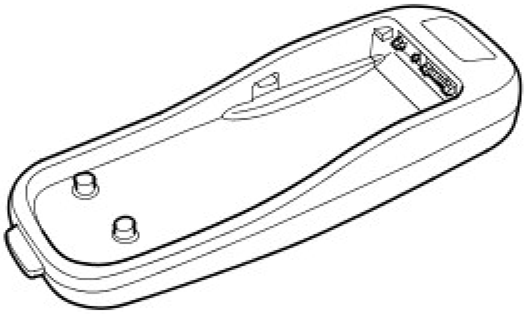
Cellular Phone Antenna



E48085

The Cellular Phone Antenna is located in the roof mounted pod and is connected via a single coaxial cable to the TM.
For additional information, refer to: Antenna (415-02 Antenna, Description and Operation).

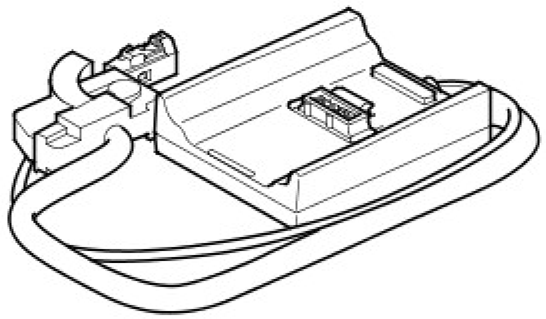
Telephone Adaptor Cradle



E48170

The telephone system allows for the use of different types/manufacturers handsets. This is achieved using a handset specific cradle which is mated to a standard base plate. The design of the adaptor cradle will vary to accommodate different types of phones.

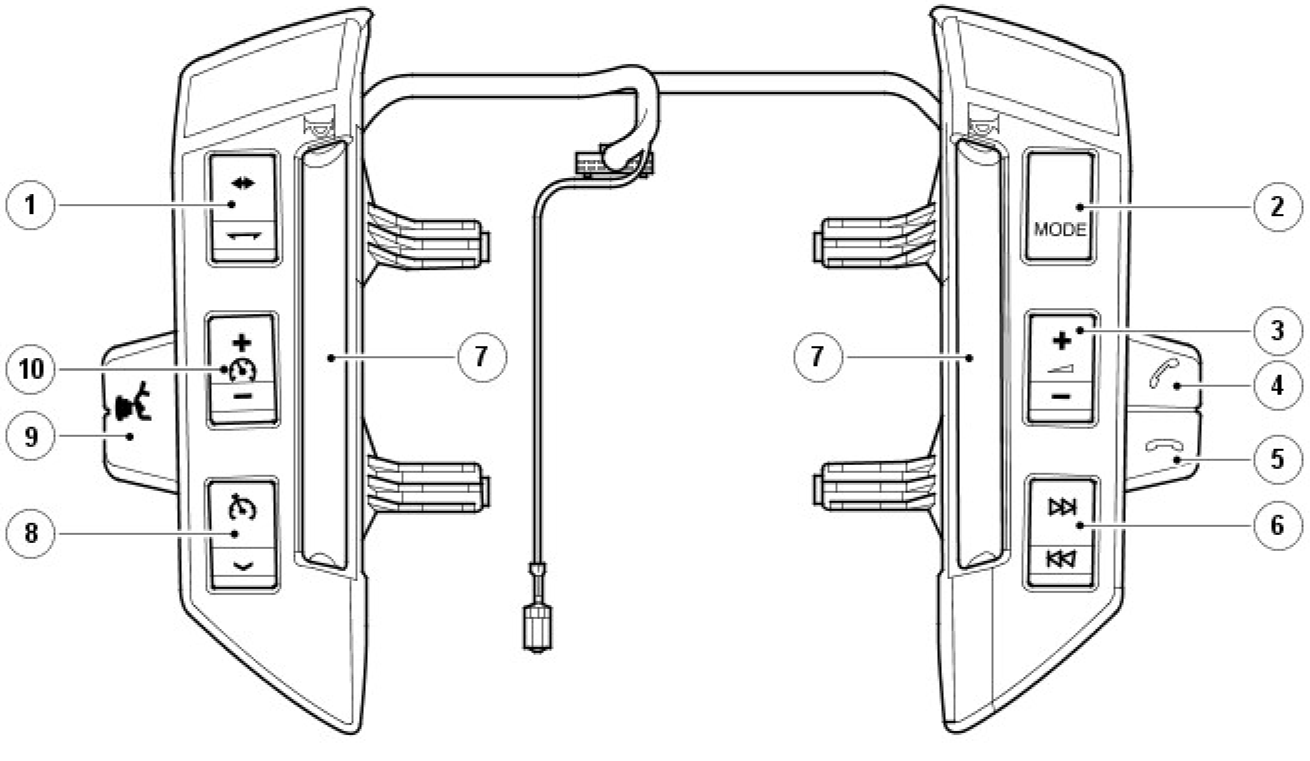
Telephone Adaptor Base Plate



E48171

The base plate is located in the center arm rest between the front seats. The base plate is connected to the TM via a dedicated serial link.

Steering Wheel Control Switches



E58417

Item	Part Number	Description
1	-	Adaptive speed control gap adjustment switches
2	-	Audio mode change switch
3	-	Audio volume control
4	-	Send key
5	-	End key
6	-	Audio system up/down
7	-	Horn
8	-	Speed control ON/OFF/ set speed
9	-	Push to talk voice recognition switch
10	-	Speed control set speed adjust

The Steering wheel control switches allow the driver to:

- Receive a phone call.

- End a phone call.
- Activate the voice recognition system.

The switches operate on a resistive ladder principle. A voltage is supplied to the switches and dependant upon which button is pressed a reduced voltage is returned to the head unit or the applicable vehicle system.

TELEPHONE SYSTEM OPERATION (up to 2009 MY)

Telephone System

The telephone system can be operated from the IHU or via voice commands. The telephone system has the following functions:

- Receive a call
- Make a call
- Phone book
- Telephone phone book download.

The telephone system is accessed via the IHU. Once the phone is docked in the cradle it is possible to read/ download the phones own phone book to find a contact or phone number. A phone number can also be dialled into the key pad on the IHU.

Calls can be received or made by pressing the push to talk button on the steering wheel mounted controls.

VOICE RECOGNITION (up to 2009 MY)

The Voice recognition system controls the following systems where fitted:

- Telephone
- Radio (inc satellite radio)
- compact disc (CD)/ MP3 Changer
- Touch Screen Display (TSD)
- Note Pad
- Navigation.

Voice control enables the driver to activate important functions of the car telephone and navigation systems without needing to operate any controls manually. This allows the driver to concentrate fully on driving the vehicle. Whenever the driver issues one of the defined voice commands with the system active, the voice control system converts the command into a control signal for the telephone or navigation system. The system recognises which system the command is directed at and routes the direction accordingly. The driver is guided through the dialogues by announcements or questions.

Voice control will not control the television or climate control systems.

Voice tags already stored in the cellular phone handset are not accessible via the vehicles voice recognition system.

Voice recognition is activated by pressing the push to talk button on the steering wheel controls.

On vehicles without navigation system fitted the voice recognition software is held in the Transceiver Module (TM) and the microphone is hardwired directly into the TM. On vehicles with navigation the voice recognition software is held in the navigation computer and the microphone is hard wired to the navigation computer as well as the TM. Vehicles with no navigation system will have a slightly reduced functionality compared with vehicles that have navigation fitted as well as the phone.

The TM only houses voice recognition software for the telephone system.

Telephone

The telephone system allows the following to be accessed and controlled by the voice recognition function.

Dial Number

This allows the user to dial a number (up to 20 digits) by digit entry with the facility to correct the number. The number that is being input is displayed on the instrument pack message center. The maximum number of recognised digits that can be entered in one go is 16.

Phonebook

The phonebook function allows the user to store phone numbers against a nametag. Nametags are user repeatable association names given to identify the numeric destination of the phone call.

This facility allows approximately 50 nametags with corresponding telephone numbers to be stored within the voice recognition phonebook. This phonebook should not be confused with the phonebook held within the SIM card or mobile phone. This facility allows editing of the nametags and phonebook and also provides audible feedback of the recorded nametag. Where nametags are part of the audible feedback the corresponding phone number will be displayed in text form on the instrument cluster message center.

It is also possible to use the add name feature to enter a telephone number onto the IHU and then by voice recognition append a nametag and store this within the voice recognition phonebook.

Radio

The radio system allows the following to be accessed and controlled by the voice recognition function.

Radio On

This allows the user to switch on the radio function. "Radio On" switches the audio system to radio with the last station played.

Radio Tune

This allows the user to tune the radio into the desired frequency and band.

Radio Presets

This allows the user to allocate frequency against a given band preset. The user must be tuned into the desired frequency and band prior to preset allocation. If a preset already has a stored frequency and band against that preset then the new frequency and band is allotted.

The Auto store feature instructs the radio to select the six strongest signals and allocate them against the auto store presets.

There are nine preset memory locations within each of the following band settings, FM, FMA, AM, AMA, MW, MWA and LW (there are only nine presets available for LW band therefore no auto store available).

Voice commands will be available to allow the user to tune the radio to a given preset within the band that is currently tuned.

Radio Directory

This function allows the user to nametag the current frequency and band including Satellite Digital Audio Radio Service(SDARS). Nametags are user repeatable association names given to identify the frequency and band information thus allowing the radio to tune into the desired signal. This facility allows 20 nametags to be stored within the voice recognition. It is also possible for the system to replay the whole of the directory with the ability to play or delete the stations announced. Individual nametags can also be deleted

Where nametags are part of the audible feedback the corresponding frequency and band is displayed in text form on the instrument cluster message center.

CD Changer

The CD changer system allows the following to be accessed and controlled by the voice recognition function.

The voice commands are standard control features with exception of controls that can be accessed on the steering wheel. Commands are available for up to 256 tracks on a CD. The track number is displayed with 3 digits, i.e. track 6 is displayed as "006".
For additional information, refer to: Audio System (415-01 Audio Unit, Description and Operation).

Display

This function allows the user to change the TSD display mode by voice command.

Voice Recognition Settings

Voice Feedback On / Off

Allows the user to choose between having audible feedback or not for functions, other than some necessary functions, which must have audible feedback to operate.

Replay

The replay command requests the voice recognition system to repeat it's last dialogue response within a list in both audible and a display in the instrument cluster message center.

Notepad

The notepad function allows the user to record a series of 10 notes for up to 5 min.

The user can replay or delete the notes in the order that they were recorded. It is also possible to delete the whole notepad.

TMC

The TMC system is part of the navigation system and provides real time traffic information to the navigation system. The voice commands are ON or OFF.

For additional information, refer to: Navigation System (419-07 Navigation System, Description and Operation).

TMC also offers dynamic route guidance. This is can also be a voice operated ON/OFF function.

BLUETOOTH® (up to 2009 MY)

The TM has Bluetooth® functionality. Bluetooth® allows the user to connect their own mobile phone (Bluetooth® enabled only) to the vehicle telephone system. Once connected the user can use the vehicle hands free functions system. The Bluetooth® system limits the functions available to those that are present in the Bluetooth® hands free profile.

Bluetooth® will not allow the following to be accessed via the IHU:

- No signal strength indication in the IHU
- Phonebook download to the IHU
- Missed calls
- Last number redial
- Calls list

Prior to the Bluetooth® equipped phone being used on the vehicle hands free system the phone must be paired to the TM. The pairing process can vary depending on the mobile handset that is being used. The following describes an example of the pairing process.

- Switch Bluetooth "ON" on the handset.
- The user initiates a search for other Bluetooth devices from the handset.
- The TM acknowledges the existence of the Bluetooth® phone.
- Land Rover appears in the handset available device list.
- The user selects Land Rover from the device list and the TM will attempt pairing.
- TM requests a PIN number from the phone.
- The user enters the TM PIN number 2121.
- If the PIN number is correct the phone is paired with the TM and its details are stored in the TM EEPROM.
- If the PIN number is correct the phone is paired with the TM and the TM details are stored in the handset.

Once paired the TM will periodically check for stored Bluetooth® devices (approximately every 20 seconds). As this occurs the user will see a connection request on the handset and either accepts or declines the request. This request will only happen once per session.

Once the pairing procedure has been completed the mobile handset will automatically connect to the vehicle system once they come into range (approximately 10 metres) and the vehicle ignition is in position II. The word Bluetooth® displays in the IHU to inform the driver that the phone is connected to the TM.

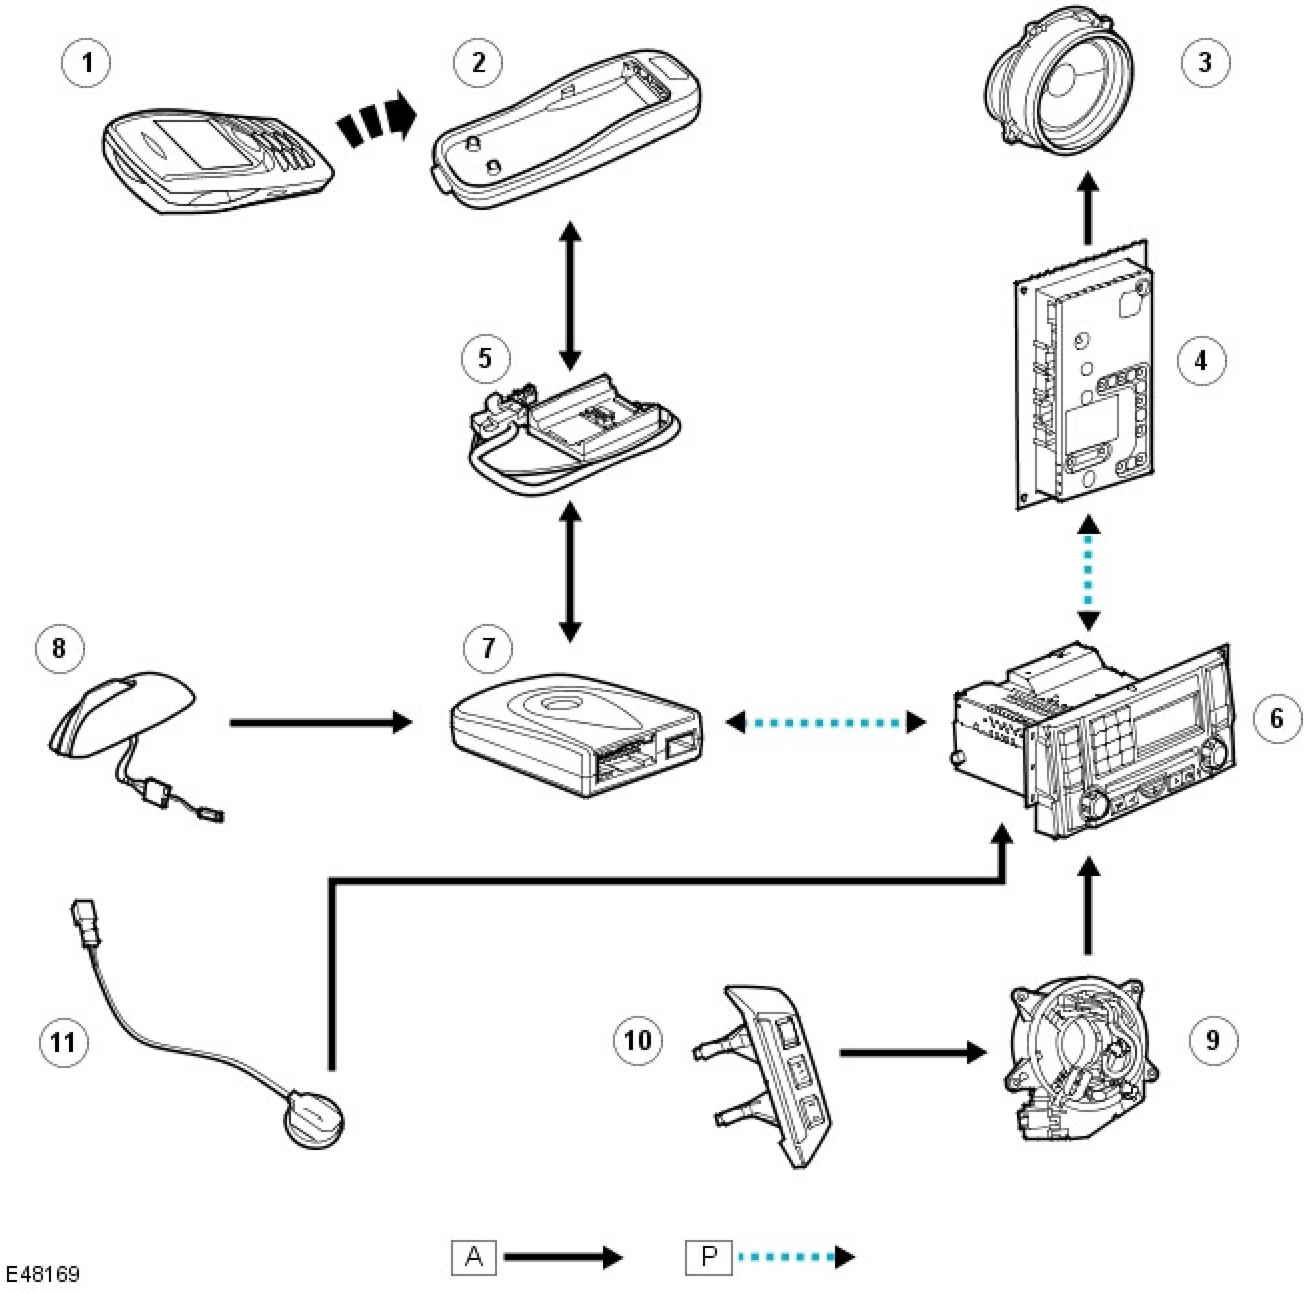
Each time a paired phone and TM come into range the TM will request connection to the phone. The user can accept or decline this request from the handset.

Up to eight Bluetooth® equipped phones can be paired with the TM. Phones can be de-registered/disconnected at any time by the user. Only one phone at a time can be used via the vehicle hands free system. If a phone is connected to the vehicle via the cradle, this phone will cancel out any Bluetooth® phone operation.

If the TM is replaced each phone that is paired with the original TM will have to be re-paired with the new TM.

Cellular Phone Control Diagram (up to 2009 MY)

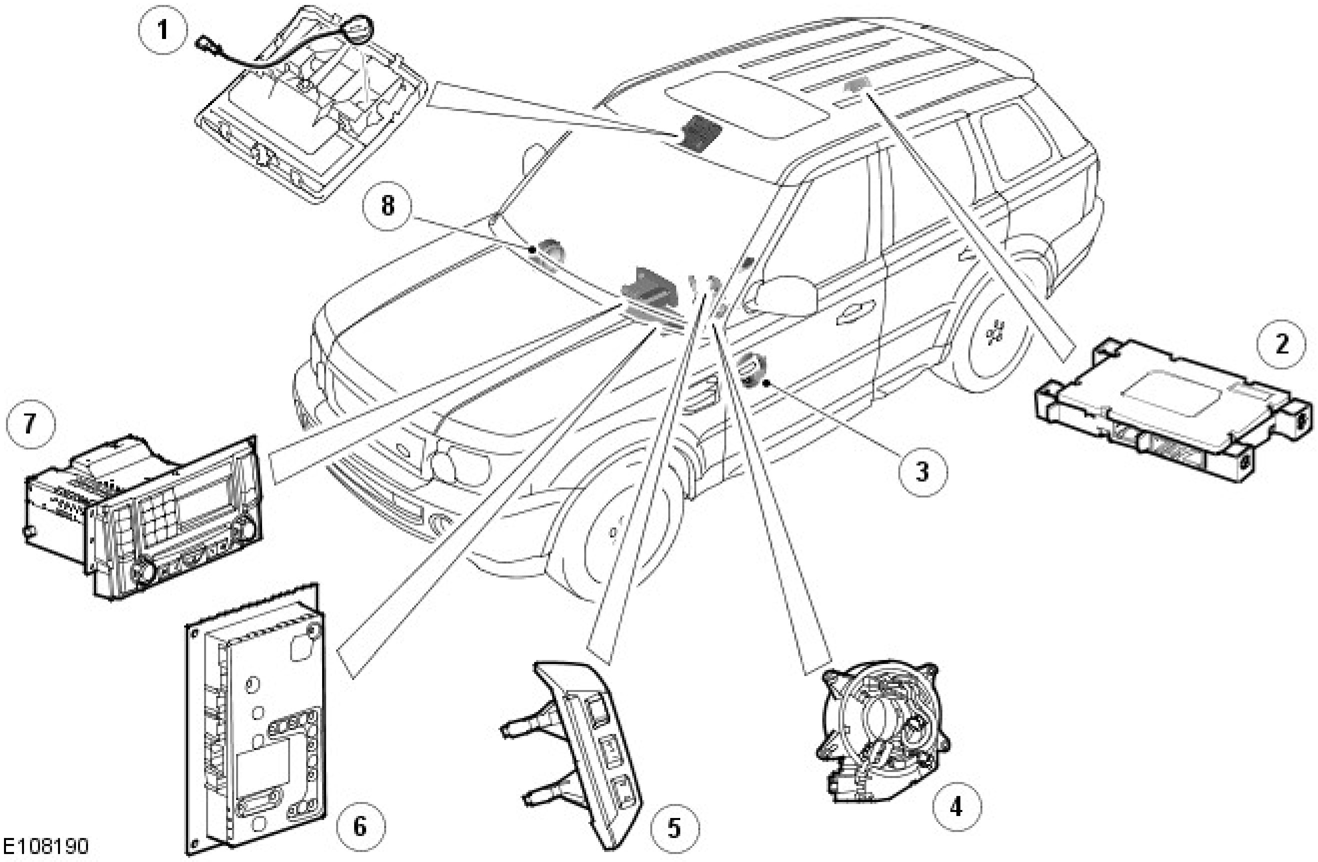
• NOTE: A= Hardwired P= MOST



Item	Part Number	Description
1	-	Mobile handset
2	-	Adaptor cradle
3	-	Speakers
4	-	Audio amplifier
5	-	Base plate adaptor
6	-	IHU
7	-	Transceiver Module (TM)
8	-	Cellular Phone Antenna
9	-	Clock spring
10	-	Steering wheel switches
11	-	Microphone

CELLULAR PHONE SYSTEM (2009 MY Onwards)

Cellular Phone Component Location (2009 MY Onwards)



Item	Part Number	Description
1	-	Microphone
2	-	Bluetooth® phone module
3	-	Speaker
4	-	Clock spring
5	-	Steering wheel switches
6	-	Amplifier
7	-	Integrated head unit
8	-	Speaker

BLUETOOTH® (2009 MY Onwards)

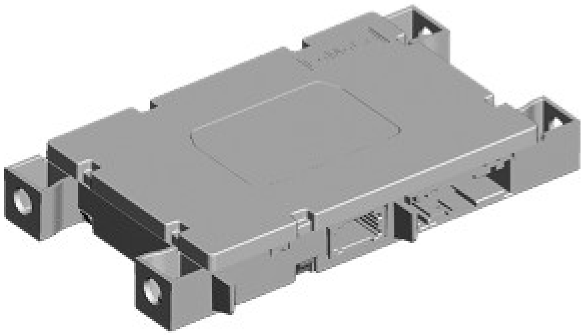
The Bluetooth® phone module allows the user to connect their own mobile phone handset (Bluetooth® enabled only) to the vehicle telephone system.

Once connected, the user can use the vehicle hands free functions although, the Bluetooth® system limits the functions to those available in the Bluetooth® hands free profile.

The available features include:

- Make/receive call
- Voice calls using the phones own voice tags (where set up)
- Signal strength indication on the Touch Screen Display (if supported by the telephone handset software)
- Phonebook download
- Missed calls
- Last number redial
- Calls list.

Bluetooth® Phone Module



E96494

The Bluetooth® phone module is connected to the MOST ring and is the interface between the telephone and the Integrated Header Unit, it processes all instructions and audio 'from and to' the phone.

TELEPHONE SYSTEM OPERATION (2009 MY Onwards)

Compatible Bluetooth® mobiles can communicate with the vehicle’s inbuilt telephone system. Connection must be made with ignition on or engine running.

Initial pairing of the phone to the vehicle

To prepare the mobile phone for pairing to the system, refer to the telephone manufacturer’s instructions, or follow the table in the vehicle handbook for generic commands.

When the handset has been successfully paired to the system, Bluetooth® will appear on the phone menu screen.

Bluetooth® selection

A maximum of 5 phones can be paired to the vehicle.

When the starter key is turned on, the vehicle searches for up to 5 previously paired phones, starting with the most recent pairing.

Before attempting a new pairing, wait for 30 seconds for this process to complete.

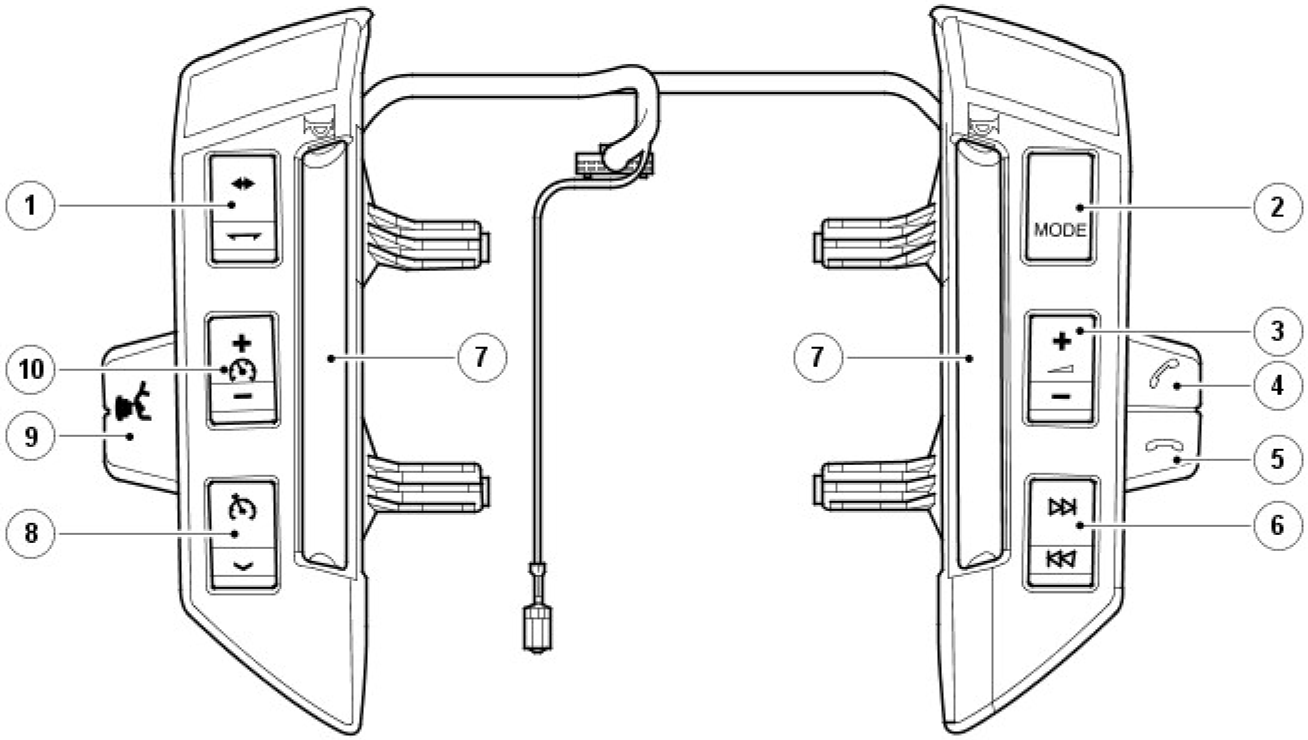
Making a call

Refer to vehicle's handbook.

Voice recognition

There is no Voice Recognition system on the Bluetooth® phone; refer to section **Voice Recognition (up to 2009 MY)**, for voice recognition information on other vehicle systems.

Steering Wheel Control Switches



E58417

Item	Part Number	Description
1	-	Adaptive speed control gap adjustment switches
2	-	Audio mode change switch
3	-	Audio volume control
4	-	Send key
5	-	End key
6	-	Audio system up/down
7	-	Horn
8	-	Speed control ON/OFF/ set speed
9	-	Push to talk voice recognition switch (Navigation System Only)
10	-	Speed control set speed adjust

The Steering wheel control switches allow the driver to:

- Receive a phone call.
- End a phone call.

The switches operate on a resistive ladder principle. A voltage is supplied to the switches and dependant upon which button is pressed a reduced voltage is returned to the head unit or the applicable vehicle system.

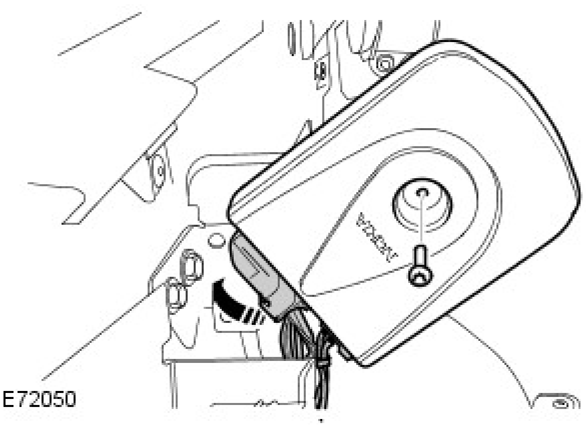
Cellular Phone - Transceiver Module

Removal and Installation

Removal



1. Remove the RH lower rear quarter trim panel.
   For additional information, refer to: Rear Quarter Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

2. ⚠ CAUTION: Cover fibre optic cable connectors to minimise dust ingress and avoid bending the cables in a radius of less than 30 mm.

   Remove the cellular phone module.

   - Remove the Torx bolt.
   - Disconnect the 2 electrical connectors.

Installation

1. Install the cellular phone module.

   - Connect the electrical connectors.
   - Tighten the Torx bolt to 10 Nm (7 lb.ft).

2. Install the RH lower rear quarter trim panel.
   For additional information, refer to: Rear Quarter Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Using WDS, configure a new module.

Diagnosis and Testing

Principle of Operation

For a detailed description of the Cellular phone system and operation, refer to the relevant Diagnosis and Testing section of the workshop manual. REFER to: Cellular Phone (419-08 Cellular Phone, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
• Check all information and entertainment system modules • Speakers • Switch(s) stuck or damaged	• Fuses • Electrical harnesses • Harness connectors • Battery condition, state of charge

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Action
Unable to pair	• GO to Pinpoint Test A.
Not Auto Connecting	• GO to Pinpoint Test B.
Poor Quality Audio	• GO to Pinpoint Test C.
No Audio to 3rd Party	• GO to Pinpoint Test D.
No Audio from 3rd Party	• GO to Pinpoint Test E.
No Audio	• GO to Pinpoint Test F.

DTC Index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible Cause	Action
B101111	ECU Supplied Power Output	• Telephone base plate adaptor power supply circuit short circuit to ground • Telephone base plate adaptor power supply circuit high resistance • Telephone base plate adaptor failure • Transceiver Module (TM) failure	Check the power supply circuits to the telephone base plate. Refer to the electrical guides. Check the base plate and transceiver module. Refer to the warranty policy and procedures manual if a module is suspect.
B101112	ECU Supplied Power Output	• Telephone base plate adaptor power supply circuit short circuit to power • Telephone base plate adaptor failure • Transceiver Module (TM) failure	Check the power supply circuits to the telephone base plate. Refer to the electrical guides. Check the base plate and transceiver module. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible Cause	Action
B1A0041	Control module	- Telephone control module flash read only memory (ROM) fault, general checksum failure	Clear the DTC and retest. If the DTC resets, renew the TEL control module Refer to the warranty policy and procedures manual if a module is suspect.
B1A0044	Control module	- Telephone control module random access memory (RAM) fault, data memory failure	Clear the DTC and retest. If the DTC resets, renew the TEL control module Refer to the warranty policy and procedures manual if a module is suspect.
B1A0045	Control module	- Telephone control module read only memory (ROM) fault, program memory failure	Clear the DTC and retest. If the DTC resets, renew the TEL control module Refer to the warranty policy and procedures manual if a module is suspect.
B1A0047	Control module	- Telephone control module internal control module failure	Clear the DTC and retest. If the DTC resets, renew the TEL control module Refer to the warranty policy and procedures manual if a module is suspect.
B1D5911	Charger System	- Charger system circuit short circuit to ground - Charger system circuit high resistance	Check the charger system circuits. Refer to the electrical guides.
B1D5912	Charger System	- Charger system circuit short circuit to power	Check the charger system circuits. Refer to the electrical guides.
B1D7984	Microphone Input	- The 'Receive Audio over MOST Test' failed and means that the audio received at the microphone detection point is too low. - Microphone fault - Harness/connector fault - Integrated head unit (IHU) fault - Base-plate module (BPM) fault	Check the operation of the microphone by substituting for a known working unit. Refer to the electrical guides and check the microphone (MIC) circuits. renew/repair as necessary. Refer to the warranty policy and procedures manual if a module is suspect.
U002968	Vehicle Communication Bus A Performance	- Event information - MOST resend count exceeded - MOST system performance	Carry out the general MOST test in this section and in the approved diagnostic system. Refer to the Network Communications section of the workshop manual.
U040068	Invalid data received	- Event information - Invalid data received - An invalid error code has been set by another MOST module	Carry out the general MOST test in this section and in the approved diagnostic system. Refer to the Network Communications section of the workshop manual.
U1A0088	Private Communication Network	- Communications failure with BT chipset in base plate module	Clear the DTC and retest. If the problem persists, renew the telephone base plate module. Refer to the warranty policy and procedures manual if a module is suspect.
U200152	Reduced System Function	- Bluetooth error - System not activated	Carry out the general MOST test in this section and in the approved diagnostic system. Refer to the Network Communications section of the workshop manual.
U200168	Reduced System Function	- Event information - temperature over 70°C established - Not a fault condition. System operation suspended while system cools.	This Event is triggered if the ECU reduces the level of functionality, to prevent over heating of the system. It is a normal function of the ECU and is not a fault. Clear/ignore this DTC.
U20019A	Reduced System Function	- Event information - base plate module (BPM) temperature over 70°C established - Not a fault condition. System operation suspended while system cools.	This Event is triggered if the BPM reduces the level of functionality, to prevent over heating of the system. It is a normal function of the ECU and is not a fault. Clear/ignore this DTC.
U201A54	Control Module Main Calibration Data	- Local configuration file is missing (not loaded) in the control module	Configure the module using the approved diagnostic system.
U30004A	Control Module	- Audio unit data memory failure	Check the power and ground circuits to the component. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible Cause	Action
U300044	Control module	- Base plate module (BPM) RAM fault (data memory failure leading to possible corrupt local configuration file)	Configure the module using the approved diagnostic system and download the local configuration file. Clear the DTC and retest. If the problem persists, renew the BPM. Refer to the warranty policy and procedures manual if a module is suspect.
U300045	Control module	- Base plate module (BPM) ROM fault (data memory failure leading to possible corrupt local configuration file)	Configure the module using the approved diagnostic system and download the local configuration file. Clear the DTC and retest. If the problem persists, renew the BPM. Refer to the warranty policy and procedures manual if a module is suspect.
U300054	Control module	- MOST not configured correctly - incorrect voice language installed	Configure the module using the approved diagnostic system.
U300056	Control module	- One or more of the received car configuration file (CCF) data parameters is deemed to be invalid	Configure the module using the approved diagnostic system.
U300316	Battery Voltage	- Battery voltage below threshold	Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical guides and check the power supply circuits to the module.
U300317	Battery Voltage	- Battery voltage above threshold	Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical guides and check the power supply circuits to the module.

Pinpoint Tests

PINPOINT TEST A : UNABLE TO PAIR

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: 'NO PHONE FITTED' DISPLAY	
• NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the bluetooth function is activated and the telephone handset is placed within the vehicle cabin area.	
	1 Carry out checks to determine if 'No Phone Fitted' is shown on vehicle display.
	Is 'No Phone Fitted' displayed? **Yes** GO to A2. **No** Locate the connected telephone and if not Customer telephone, disconnect from the system.
A2: TELEPHONE BLUETOOTH DEVICE SEARCH	
	1 Carry out Bluetooth device search using Customer handset.
	Is 'Land Rover' identified in Bluetooth device list? **Yes** Select device from list, then continue with diagnosis.GO to A3. **No** Carry out further Bluetooth device search, to a maximum of 4 times, waiting approximately 20 seconds between searches. If 'Land Rover' still not identified in Bluetooth device list, set ignition status to OFF, wait approximately 30 seconds and set ignition status to ON. Carry out further Bluetooth device search, to a maximum of 4 times, waiting approximately 20 seconds between searches. If 'Land Rover' still not identified in Bluetooth device list, contact your local in market support for further assistance.
A3: TELEPHONE HANDSET ERROR	
	1 Check for any error shown on the telephone handset when 'Land Rover' is selected from the Bluetooth device list.
	Was an error immediately shown on the telephone handset? **Yes** Wait approximately 10 seconds then re-attempt selection, to a maximum of 4 times, waiting approximately 10 seconds between each attempt. If error still being displayed, contact your local in market support for assistance. **No** Enter PIN '2121' then continue with diagnosis.GO to A4.
A4: PIN ENTRY STATUS	
	1 Check for successful PIN entry.

	Was PIN entry successful? **Yes** GO to A5. **No** Wait approximately 10 seconds then re-attempt PIN entry, to a maximum of 4 times, waiting approximately 10 seconds between each attempt. If PIN entry is still un-successful, contact your local in market support for assistance.
A5: 'NO PHONE FITTED' DISPLAY	
	1 Carry out checks to determine if 'No Phone Fitted' is still shown on vehicle display.
	Is 'No Phone Fitted' still displayed? **Yes** From the telephone handset, select the connect option for the 'Land Rover' device identified in the Bluetooth device list. If 'No Phone Fitted' is still displayed, suspect a telephone handset fault. Carry out Pinpoint test again using known good telephone handset. **No** The telephone is paired and connected to the system. No further action is required for this symptom.

PINPOINT TEST B : NOT AUTOMATICALLY CONNECTING

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: CUSTOMER TELEPHONE IN POSITION 1	
• NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the bluetooth and auto connect functions are activated and the telephone handset is placed within the vehicle cabin area.	
	1 Carry out checks to determine if the Customer telephone is in position 1 in the Bluetooth Module device list.
	Is the Customer telephone in position 1? **Yes** GO to B2. **No** Advise Customer that delays in connection will occur if telephone is not listed in position 1.
B2: BLUETOOTH CONNECTION	
	1 Carry out checks to determine if Bluetooth connection to the vehicle has been achieved.
	Has Bluetooth connection to the vehicle been achieved? **Yes** No further action is required for this symptom. **No** GO to B3.
B3: 'NO PHONE FITTED' DISPLAY	
	1 Carry out checks to determine if 'Land Rover' is shown in the Customer Bluetooth telephone device display.
	Is 'Land Rover' identified in the Customer Bluetooth device list? **Yes** Select the device to connect then follow pairing instructions. **No** Carry out the 'Unable to Pair' Pinpoint Test.

PINPOINT TEST C : POOR QUALITY AUDIO

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
C1: SIGNAL STRENGTH	
• NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the telephone is placed within the vehicle cabin area and is connected to the vehicle via bluetooth.	
	1 Check the signal strength displayed on the telephone handset.
	Are at least two signal strength bars shown on the telephone handset display? **Yes** GO to C2. **No** Suspect GSM Network issue. This can explain intermittent audio and dropped calls, and the inability to initiate calls.
C2: POOR AUDIO FROM THIRD PARTY ONLY	
	1 Establish from Customer feedback/symptom if there is poor audio from the Third Party only.
	Is the poor audio from the Third Party only? **Yes** Suspect GSM Network issue. This can explain intermittent audio and dropped calls, and the inability to initiate calls.

	No GO to C3.
C3: POOR AUDIO TO THIRD PARTY ONLY	
	1 Establish from Customer feedback/symptom if there is poor audio to the Third Party only.
	Is the poor audio to the Third Party only? **Yes** Check and install a new microphone as necessary. **No** GO to C4.
C4: POOR AUDIO WITH VEHICLE STATIONARY	
	1 Establish from Customer feedback/symptom if there is poor audio when the vehicle is stationary only.
	Is the poor audio when the vehicle is stationary only? **Yes** Check and install a new microphone as necessary. **No** GO to C5.
C5: THIRD PARTY MOVING VEHICLE	
	1 Establish from Customer feedback/symptom if the Third Party is in a moving vehicle.
	Is the Third Party in a moving vehicle? **Yes** There are limitations to the way the system can improve audio, and in this situation it is not possible to determine the source of the audio degradation. **No** GO to C6.
C6: CUSTOMER HEARING ECHO	
	1 Establish from Customer feedback/symptom if the Customer is hearing an echo.
	Is the Customer hearing an echo? **Yes** Echo from the Third Party is not vehicle failure, it is the Third Party set-up. No further action is required for this symptom. **No** Contact your local in market support for assistance.

PINPOINT TEST D : NO AUDIO TO THIRD PARTY	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
D1: MICROPHONE DIAGNOSTIC TROUBLE CODES (DTCS)	
• NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the telephone is placed within the vehicle cabin area and is connected to the vehicle via bluetooth.	
	1 Using the Manufacturer approved diagnostic system, check for any logged microphone DTCs in Audio Front Control module.
	Is DTC B1D79-01 logged? **Yes** Carry out diagnosis of electrical failure as advised in Action column of DTC Index. **No** Contact your local in market support for assistance.

PINPOINT TEST E : NO AUDIO FROM THIRD PARTY	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
E1: 'IN CALL' DISPLAY	
• NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the telephone is placed within the vehicle cabin area and is connected to the vehicle via bluetooth.	
	1 Carry out checks to determine if 'In Call' is shown on the vehicle display.
	Is vehicle display showing 'In Call'? **Yes** Contact your local in market support for assistance. **No** Call has ended. No further action is required for this symptom.

PINPOINT TEST F : NO AUDIO	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
F1: AUDIO FROM THIRD PARTY	

• NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the telephone is placed within the vehicle cabin area and is connected to the vehicle via bluetooth.

1 Establish from Customer feedback/symptom if there is Audio from the Third Party.

Is there Audio from the Third Party?

Yes

GO to F2.

No

Refer to the 'No Audio From Third Party' Pinpoint test.GO to E.

F2: AUDIO TO THIRD PARTY

1 Establish from Customer feedback/symptom if there is Audio to the Third Party.

Is there Audio to the Third Party?

Yes

GO to F3.

No

Refer to the 'No Audio To Third Party' Pinpoint test.GO to D.

F3: CD OR RADIO AUDIO

1 Establish from Customer feedback/symptom if there is Audio from the CD or Radio.

Is there Audio from the CD or Radio?

Yes

GO to F4.

No

Suspect MOST ring fault, refer to electrical circuit diagrams and check/rectify MOST ring as necessary.

F4: TELEPHONE HANDSET AUDIO

1 Establish from Customer feedback/symptom if there is Audio from the telephone handset.

Is there Audio from the telephone handset?

Yes

Ensure vehicle is parked. Disconnect and reconnect handset. If issue not resolved, contact your local in market support for assistance.

No

Contact you local in market support for assistance.

LAND
ROVER

Health and safety

Always follow health and safety guidelines, specifically those detailed in the Workshop Manual.

Using this publication

The information provided in this publication is for use only by competent, qualified auto-electricians. Good product knowledge is assumed, as well as the ability to access and use recommended test equipment and other reference material provided.

Test equipment and other reference material

The information in this publication should be used in conjunction with the recommended test equipment; refer to Workshop Manual. Other reference material includes: Technical Service Bulletins (TSB) and the Workshop Manual.

The Electrical Reference Library (ERL) may also prove useful since it provides detailed connector information.

Battery disconnection and reconnection

It is imperative that any information relating to battery disconnection and reconnection is followed; refer to the appropriate sections in the Workshop Manual.

Fault Diagnosis

Always use the recommended test equipment for correct and reliable fault diagnosis, refer to the Workshop Manual.

Harness Repair

Repairs should only be undertaken for connectors where a Service Repair Kit is available; refer to the appropriate Electrical Reference Library (ERL).
Note: Fibre Optic circuits cannot be repaired; refer to the Workshop Manual.

Abbreviations

Abbreviation	Description
ABS	Anti-lock braking system
AFS	Adaptive front lighting system
AUTO	Automatic transmission
CAN	Controller area network
DSC	Dynamic stability control
DV6	Diesel engine - V6
DV8	Diesel engine - V8
EGR	Exhaust gas recirculation
EU3	DV6 - Without inlet port deactivation
EU4	DV6 - With inlet port deactivation
FET	Field effect transistor
GPS	Global positioning system
PV6	Petrol engine - V6
PV8	Petrol engine - V8
PV8NA	Naturally aspirated engine - V8
PV8SC	Super charged engine - V8
LH	Left-hand
MAF/IAT	Mass air flow / intake air temperature
NAS	North American specification
PDC	Park distance control
RH	Right-hand
TPMS	Tire pressure monitoring system
TSD	Touch screen display

Section numbering

The sections in this publication are ordered to match the Global Outline numbering system as found in the current Workshop Manual. The Power and Ground distribution circuits can be found under section 414-01, BATTERY, MOUNTING AND CABLES.

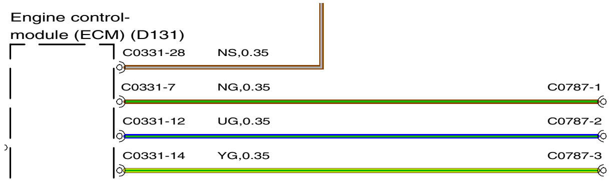
Note: Where circuit diagrams show more than one sub-system, the circuit will be located in the section that carries the first-named sub-system, for example: Starting and Charging will be located under section 303-06 Starting System, since 'Starting' is the first-named sub-system.

Circuit sheet numbering

The figures in brackets to the left of the page number indicate a circuit sheet number and the total number of sheets per circuit, for example (01 / 05) represents sheet 1 of 5.

Understanding the circuit diagrams

Components



Engine control-
module (ECM) (D131)
C0331-28
NS,0.35
C0331-7
NG,0.35
C0787-1
C0331-12
UG,0.35
C0787-2
C0331-14
YG,0.35
C0787-3

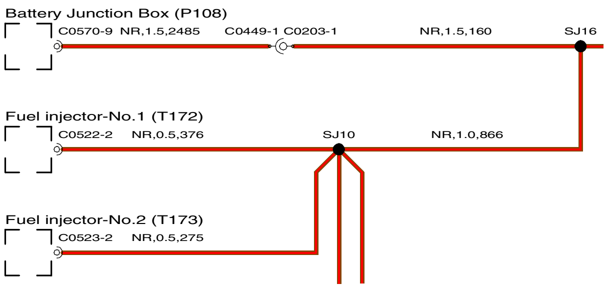
After each component description, a translation code is displayed in brackets, for example: Starter relay (R102), Engine control-module (ECM)(D131). The codes can be ignored.

Note: A dotted outline indicates that the component identified is not shown in its entirety.

Connectors

Connectors and header joints are identified by their corresponding connector number with a numbered suffix to indicate the pin-out detail of the wire, i.e. C0292-1 identifies connector 292, pin number 1. Wire insulation colours are listed in a table at the end of this section. Where wires have a predominant colour with a secondary colour tracer, the main colour is identified first, i.e. LGS - light green with a slate tracer.

Splices



Battery Junction Box (P108)
C0570-9
NR,1.5,2485
C0449-1
C0203-1
NR,1.5,160
SJ16
Fuel injector-No.1 (T172)
C0522-2
NR,0.5,376
SJ10
NR,1.0,866
Fuel injector-No.2 (T173)
C0523-2
NR,0.5,275

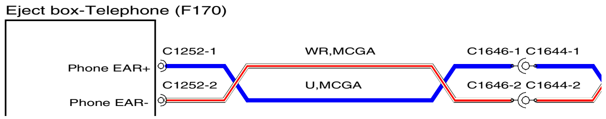
The splices (and where appropriate, the header) circuit pages show the full interconnectivity of components and systems.

Note: The splice information shown on individual system circuits is not complete. Always refer to the splices circuit pages for complete information for each splice.

Wire length (Splices, Power and Ground Distribution only)

The wire length (in millimetres) is displayed after the colour and cross sectional area; for example, SR,0.35,480. In this example, the figure, 480 indicates the approximate position of the harness splice is 480mm from connector C2335.

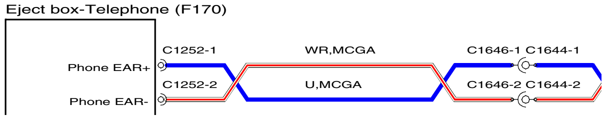
Wire Types



Eject box-Telephone (F170)
Phone EAR+
Phone EAR-
C1252-1
C1252-2
WR,MCGA
U,MCGA
C1646-1 C1644-1
C1646-2 C1644-2

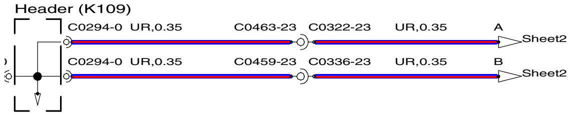
Multicore wires are identified by the prefix M suffixed by three or four other letters, for example MCGA, MAPN. The suffix precisely defines the parameters that comprise the specification of the wire type. The specification is defined during the design process of an electrical system, therefore it is imperative that the correct specification is maintained to ensure the correct operating characteristics and continued functionality for a given system.

Line Types



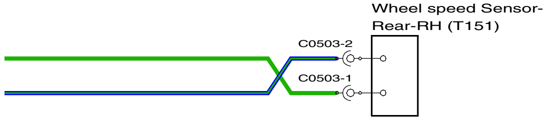
Eject box-Telephone (F170)
Phone EAR+
Phone EAR-
C1252-1
C1252-2
WR,MCGA
U,MCGA
C1646-1 C1644-1
C1646-2 C1644-2

Crossed wires as illustrated above show an example of how a twisted pair of wires may be represented on the circuits.

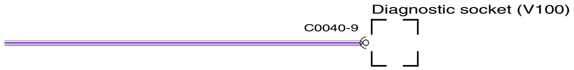


Header (K109)
C0294-0 UR,0.35
C0463-23 C0322-23
UR,0.35
A
Sheet2
C0294-0 UR,0.35
C0459-23 C0336-23
UR,0.35
B
Sheet2

The arrows illustrated above show an example of the page break symbols, identifying that the circuit continues at the corresponding letter on the sheet number indicated.



Wheel speed Sensor-
Rear-RH (T151)
C0503-2
C0503-1



Diagnostic socket (V100)
C0040-9

The cup and ball symbol represents the male and female halves of connector. Most connectors plug directly into a component but some are wired directly to the component using a ‘flylead’ as with C503 above.

Ground points

Ground points are identified with an eyelet symbol and a connector number, except where components are grounded through its fixings, when only the eyelet is shown.

CONTENTS

INTRODUCTION

Health and safety 5
Using this publication 5
Abbreviations 5
Section numbering 6
Circuit sheet numbering 6
Understanding the circuit diagrams 6

204-04 WHEELS AND TIRES

Tire pressure monitoring system 9

204-05 VEHICLE DYNAMIC SUSPENSION

Air suspension 10

204-06 RIDE AND HANDLING OPTIMIZATION

Terrain Response 12
Dynamic Response 14

205-02 REAR DRIVE AXLE AND DIFFERENTIAL

.... 15

206-05 PARKING BRAKE AND ACTUATION

.... 17

206-09 ANTI-LOCK CONTROL

Steering angle sensor 19
.... 20

211-04 STEERING COLUMN

Clock spring 22

303-03 ENGINE COOLING

Cooling Fans - Diesel 23
Coolant pump - PV8SC 24

303-06 STARTING SYSTEM

Ignition switch 25

303-14 ELECTRONIC ENGINE CONTROLS

DV6 - Without inlet port deactivation 26
DV8 31
V8NA 37
V8SC 44
DV6 - With inlet port deactivation 51

307-01 AUTOMATIC TRANSMISSION

Petrol 56
Diesel 59

308-07 FOUR WHEEL DRIVE SYSTEMS

Transfer box - Petrol 62
Transfer box - Diesel 64

310-01 FUEL TANK AND FUEL LINES

.... 66

310-03 SPEED CONTROL

.... 68

412-01 CLIMATE CONTROL

TSD 70

412-02 AUXILIARY CLIMATE CONTROL

Fuel fired booster heater - DV8 74
Windshield heater 75
Rear window heater 76
Cool box 77

413-00 INSTRUMENT CLUSTER AND PANEL ILLUMINATION

.... 78

413-01 INSTRUMENT CLUSTER

.... 83

413-06 HORN

.... 86

413-13 PARKING AID

.... 87

414-01 BATTERY, MOUNTING AND CABLES

Battery junction box 90
Central junction box 97
Ground distribution 106
Splices 116
Transit relay 138

414-02 GENERATOR AND REGULATOR

PV8 139
DV6 - Without inlet port deactivation 140
DV8 141
DV6 - With inlet port deactivation 142

415-00 INFORMATION AND ENTERTAINMENT SYSTEM

High line - Harman Kardon 143
Low line 156

417-01 EXTERIOR LIGHTING

Headlamps - adaptive front lighting system 164
Stop and reverse lamps 167
Headlamps - cornering 168
Fog lamps 169
Headlamps - high intensity discharge 170
Headlamps 173
Turn signal indicators and hazard flashers 176
Lighting control switch 178
Trailer socket 179

417-02 INTERIOR LIGHTING

.... 181

418-00 MODULE COMMUNICATIONS NETWORK

CAN bus - high speed 184
Diagnostic socket 188
CAN bus - medium speed 189
MOST 191

419-01 ANTI-THEFT SYSTEM

Active 203
Passive 206

501-09 REAR VIEW MIRRORS

Electrochromic 207
Heated 208
Non memory 209
Memory 210
Fold back 212

501-10 SEATING

Heated - rear 213
Memory 215
Heated - front 217
Non memory 218
Lumbar support - memory 220
Lumbar support - non memory 221

501-11 GLASS, FRAMES AND MECHANISMS

Window lift 222

501-12 INSTRUMENT PANEL AND CONSOLE

Cigar lighter 224
Accessory socket 225

501-14 HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS

Central locking system 226
Tailgate power striker 231

501-16 WIPERS AND WASHERS

Front 232
Power wash 233
Washer jets - heated 234
Rear 235

501-17 ROOF OPENING PANEL

Health and safety

Always follow health and safety guidelines, specifically those detailed in the Workshop Manual.

Using this publication

The information provided in this publication is for use only by competent, qualified auto-electricians. Good product knowledge is assumed, as well as the ability to access and use recommended test equipment and other reference material provided.

Test equipment and other reference material

The information in this publication should be used in conjunction with the recommended test equipment; refer to Workshop Manual. Other reference material includes: Technical Service Bulletins (TSB) and the Workshop Manual.

The Electrical Reference Library (ERL) may also prove useful since it provides detailed connector information.

Battery disconnection and reconnection

It is imperative that any information relating to battery disconnection and reconnection is followed; refer to the appropriate sections in the Workshop Manual.

Fault Diagnosis

Always use the recommended test equipment for correct and reliable fault diagnosis, refer to the Workshop Manual.

Harness Repair

Repairs should only be undertaken for connectors where a Service Repair Kit is available; refer to the appropriate Electrical Reference Library (ERL).
Note: Fibre Optic circuits cannot be repaired; refer to the Workshop Manual.

Abbreviations

Abbreviation	Description
ABS	Anti-lock braking system
AFS	Adaptive front lighting system
AUTO	Automatic transmission
CAN	Controller area network
DSC	Dynamic stability control
DV6	Diesel engine - V6
DV8	Diesel engine - V8
EGR	Exhaust gas recirculation
EU3	DV6 - Without inlet port deactivation
EU4	DV6 - With inlet port deactivation
FET	Field effect transistor
GPS	Global positioning system
PV6	Petrol engine - V6
PV8	Petrol engine - V8
PV8NA	Naturally aspirated engine - V8
PV8SC	Super charged engine - V8
LH	Left-hand
MAF/IAT	Mass air flow / intake air temperature
NAS	North American specification
PDC	Park distance control
RH	Right-hand
TPMS	Tire pressure monitoring system
TSD	Touch screen display

Section numbering

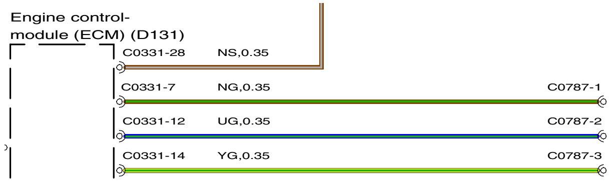
The sections in this publication are ordered to match the Global Outline numbering system as found in the current Workshop Manual. The Power and Ground distribution circuits can be found under section 414-01, BATTERY, MOUNTING AND CABLES.
Note: Where circuit diagrams show more than one sub-system, the circuit will be located in the section that carries the first-named sub-system, for example: Starting and Charging will be located under section 303-06 Starting System, since 'Starting' is the first-named sub-system.

Circuit sheet numbering

The figures in brackets to the left of the page number indicate a circuit sheet number and the total number of sheets per circuit, for example (01 / 05) represents sheet 1 of 5.

Understanding the circuit diagrams

Components



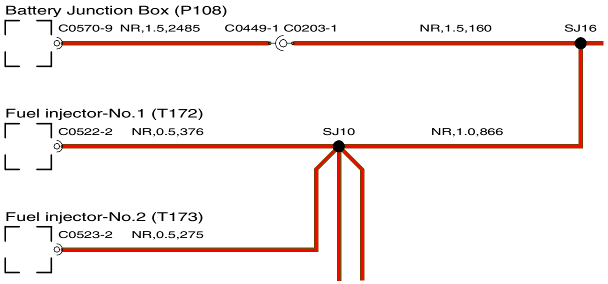
Engine control-
module (ECM) (D131)
C0331-28
NS,0.35
C0331-7
NG,0.35
C0787-1
C0331-12
UG,0.35
C0787-2
C0331-14
YG,0.35
C0787-3

After each component description, a translation code is displayed in brackets, for example: Starter relay (R102), Engine control-module (ECM)(D131). The codes can be ignored.
Note: A dotted outline indicates that the component identified is not shown in its entirety.

Connectors

Connectors and header joints are identified by their corresponding connector number with a numbered suffix to indicate the pin-out detail of the wire, i.e. C0292-1 identifies connector 292, pin number 1. Wire insulation colours are listed in a table at the end of this section. Where wires have a predominant colour with a secondary colour tracer, the main colour is identified first, i.e. LGS - light green with a slate tracer.

Splices



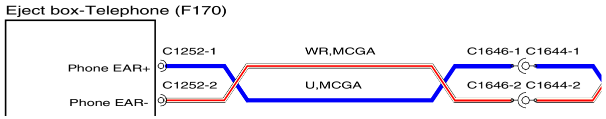
Battery Junction Box (P108)
C0570-9
NR,1.5,2485
C0449-1
C0203-1
NR,1.5,160
SJ16
Fuel injector-No.1 (T172)
C0522-2
NR,0.5,376
SJ10
NR,1.0,866
Fuel injector-No.2 (T173)
C0523-2
NR,0.5,275

The splices (and where appropriate, the header) circuit pages show the full interconnectivity of components and systems.
Note: The splice information shown on individual system circuits is not complete. Always refer to the splices circuit pages for complete information for each splice.

Wire length (Splices, Power and Ground Distribution only)

The wire length (in millimetres) is displayed after the colour and cross sectional area; for example, SR,0.35,480. In this example, the figure, 480 indicates the approximate position of the harness splice is 480mm from connector C2335.

Wire Types



Eject box-Telephone (F170)
C1252-1
WR,MCGA
C1646-1 C1644-1
Phone EAR+
C1252-2
U,MCGA
C1646-2 C1644-2
Phone EAR-

Multicore wires are identified by the prefix M suffixed by three or four other letters, for example MCGA, MAPN. The suffix precisely defines the parameters that comprise the specification of the wire type. The specification is defined during the design process of an electrical system, therefore it is imperative that the correct specification is maintained to ensure the correct operating characteristics and continued functionality for a given system.

Sheet2

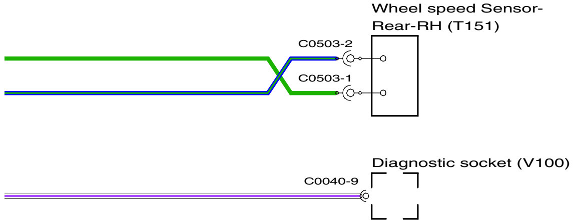
The arrows illustrated above show an example of the page break symbols, identifying that the circuit continues at the corresponding letter on the sheet number indicated.



Wheel speed Sensor-
Rear-RH (T151)
C0503-2
C0503-1
Diagnostic socket (V100)
C0040-9

The cup and ball symbol represents the male and female halves of connector. Most connectors plug directly into a component but some are wired directly to the component using a ‘flylead’ as with C503 above.

Ground points

Ground points are identified with an eyelet symbol and a connector number, except where components are grounded through its fixings, when only the eyelet is shown.

Health and safety

Always follow health and safety guidelines, specifically those detailed in the Workshop Manual.

Using this publication

The information provided in this publication is for use only by competent, qualified auto-electricians. Good product knowledge is assumed, as well as the ability to access and use recommended test equipment and other reference material provided.

Test equipment and other reference material

The information in this publication should be used in conjunction with the recommended test equipment; refer to Workshop Manual. Other reference material includes: Technical Service Bulletins (TSB) and the Workshop Manual.

The Electrical Reference Library (ERL) may also prove useful since it provides detailed connector information.

Battery disconnection and reconnection

It is imperative that any information relating to battery disconnection and reconnection is followed; refer to the appropriate sections in the Workshop Manual.

Fault Diagnosis

Always use the recommended test equipment for correct and reliable fault diagnosis, refer to the Workshop Manual.

Harness Repair

Repairs should only be undertaken for connectors where a Service Repair Kit is available; refer to the appropriate Electrical Reference Library (ERL).
Note: Fibre Optic circuits cannot be repaired; refer to the Workshop Manual.

Abbreviations

Abbreviation	Description
ABS	Anti-lock braking system
AFS	Adaptive front lighting system
AUTO	Automatic transmission
CAN	Controller area network
DSC	Dynamic stability control
DV6	Diesel engine - V6
DV8	Diesel engine - V8
EGR	Exhaust gas recirculation
EU3	DV6 - Without inlet port deactivation
EU4	DV6 - With inlet port deactivation
FET	Field effect transistor
GPS	Global positioning system
PV6	Petrol engine - V6
PV8	Petrol engine - V8
PV8NA	Naturally aspirated engine - V8
PV8SC	Super charged engine - V8
LH	Left-hand
MAF/IAT	Mass air flow / intake air temperature
NAS	North American specification
PDC	Park distance control
RH	Right-hand
TPMS	Tire pressure monitoring system
TSD	Touch screen display

Section numbering

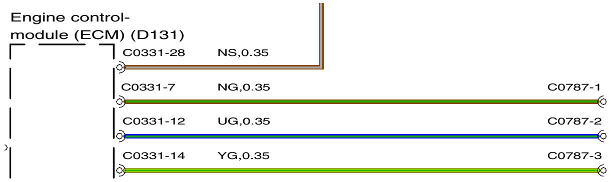
The sections in this publication are ordered to match the Global Outline numbering system as found in the current Workshop Manual. The Power and Ground distribution circuits can be found under section 414-01, BATTERY, MOUNTING AND CABLES.
Note: Where circuit diagrams show more than one sub-system, the circuit will be located in the section that carries the first-named sub-system, for example: Starting and Charging will be located under section 303-06 Starting System, since 'Starting' is the first-named sub-system.

Circuit sheet numbering

The figures in brackets to the left of the page number indicate a circuit sheet number and the total number of sheets per circuit, for example (01 / 05) represents sheet 1 of 5.

Understanding the circuit diagrams

Components



Engine control-
module (ECM) (D131)
C0331-28
NS,0.35
C0331-7
NG,0.35
C0787-1
C0331-12
UG,0.35
C0787-2
C0331-14
YG,0.35
C0787-3

After each component description, a translation code is displayed in brackets, for example: Starter relay (R102), Engine control-module (ECM)(D131). The codes can be ignored.
Note: A dotted outline indicates that the component identified is not shown in its entirety.

Connectors

Connectors and header joints are identified by their corresponding connector number with a numbered suffix to indicate the pin-out detail of the wire, i.e. C0292-1 identifies connector 292, pin number 1. Wire insulation colours are listed in a table at the end of this section. Where wires have a predominant colour with a secondary colour tracer, the main colour is identified first, i.e. LGS - light green with a slate tracer.

Splices

Battery Junction Box (P108)
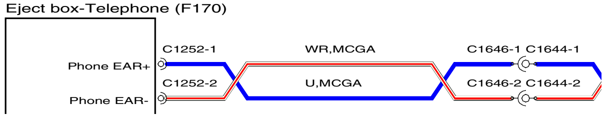
C0570-9
NR,1.5,2485
C0449-1 C0203-1
NR,1.5,160
SJ16
Fuel injector-No.1 (T172)
C0522-2
NR,0.5,376
SJ10
NR,1.0,866
Fuel injector-No.2 (T173)
C0523-2
NR,0.5,275

The splices (and where appropriate, the header) circuit pages show the full interconnectivity of components and systems.
Note: The splice information shown on individual system circuits is not complete. Always refer to the splices circuit pages for complete information for each splice.

Wire length (Splices, Power and Ground Distribution only)

The wire length (in millimetres) is displayed after the colour and cross sectional area; for example, SR,0.35,480. In this example, the figure, 480 indicates the approximate position of the harness splice is 480mm from connector C2335.

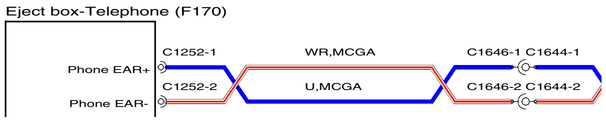
Wire Types



Eject box-Telephone (F170)
Phone EAR+
Phone EAR-
C1252-1
C1252-2
WR,MCGA
U,MCGA
C1646-1 C1644-1
C1646-2 C1644-2

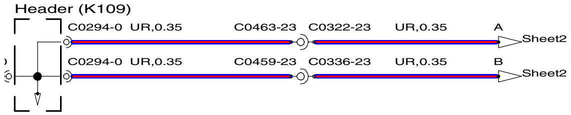
Multicore wires are identified by the prefix M suffixed by three or four other letters, for example MCGA, MAPN. The suffix precisely defines the parameters that comprise the specification of the wire type. The specification is defined during the design process of an electrical system, therefore it is imperative that the correct specification is maintained to ensure the correct operating characteristics and continued functionality for a given system.

Line Types



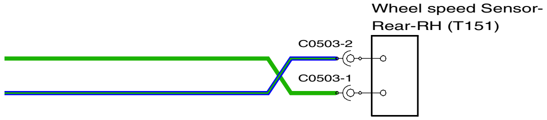
Eject box-Telephone (F170)
Phone EAR+
Phone EAR-
C1252-1
C1252-2
WR,MCGA
U,MCGA
C1646-1 C1644-1
C1646-2 C1644-2

Crossed wires as illustrated above show an example of how a twisted pair of wires may be represented on the circuits.

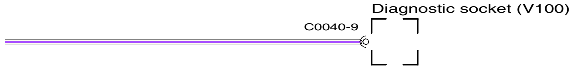


Header (K109)
C0294-0 UR,0.35
C0463-23 C0322-23
UR,0.35
A
Sheet2
C0294-0 UR,0.35
C0459-23 C0336-23
UR,0.35
B
Sheet2

The arrows illustrated above show an example of the page break symbols, identifying that the circuit continues at the corresponding letter on the sheet number indicated.



Wheel speed Sensor-
Rear-RH (T151)
C0503-2
C0503-1



Diagnostic socket (V100)
C0040-9

The cup and ball symbol represents the male and female halves of connector. Most connectors plug directly into a component but some are wired directly to the component using a ‘flylead’ as with C503 above.

Ground points

Ground points are identified with an eyelet symbol and a connector number, except where components are grounded through its fixings, when only the eyelet is shown.

Health and safety

Always follow health and safety guidelines, specifically those detailed in the Workshop Manual.

Using this publication

The information provided in this publication is for use only by competent, qualified auto-electricians. Good product knowledge is assumed, as well as the ability to access and use recommended test equipment and other reference material provided.

Test equipment and other reference material

The information in this publication should be used in conjunction with the recommended test equipment; refer to Workshop Manual. Other reference material includes: Technical Service Bulletins (TSB) and the Workshop Manual.

The Electrical Reference Library (ERL) may also prove useful since it provides detailed connector information.

Battery disconnection and reconnection

It is imperative that any information relating to battery disconnection and reconnection is followed; refer to the appropriate sections in the Workshop Manual.

Fault Diagnosis

Always use the recommended test equipment for correct and reliable fault diagnosis, refer to the Workshop Manual.

Harness Repair

Repairs should only be undertaken for connectors where a Service Repair Kit is available; refer to the appropriate Electrical Reference Library (ERL).
Note: Fibre Optic circuits cannot be repaired; refer to the Workshop Manual.

Abbreviations

Abbreviation	Description
ABS	Anti-lock braking system
AFS	Adaptive front lighting system
AUTO	Automatic transmission
CAN	Controller area network
DSC	Dynamic stability control
DV6	Diesel engine - V6
DV8	Diesel engine - V8
EGR	Exhaust gas recirculation
EU3	DV6 - Without inlet port deactivation
EU4	DV6 - With inlet port deactivation
FET	Field effect transistor
GPS	Global positioning system
PV6	Petrol engine - V6
PV8	Petrol engine - V8
PV8NA	Naturally aspirated engine - V8
PV8SC	Super charged engine - V8
LH	Left-hand
MAF/IAT	Mass air flow / intake air temperature
NAS	North American specification
PDC	Park distance control
RH	Right-hand
TPMS	Tire pressure monitoring system
TSD	Touch screen display

Section numbering

The sections in this publication are ordered to match the Global Outline numbering system as found in the current Workshop Manual. The Power and Ground distribution circuits can be found under section 414-01, BATTERY, MOUNTING AND CABLES.
Note: Where circuit diagrams show more than one sub-system, the circuit will be located in the section that carries the first-named sub-system, for example: Starting and Charging will be located under section 303-06 Starting System, since 'Starting' is the first-named sub-system.

Circuit sheet numbering

The figures in brackets to the left of the page number indicate a circuit sheet number and the total number of sheets per circuit, for example (01 / 05) represents sheet 1 of 5.

Understanding the circuit diagrams

Components

Engine control-module (ECM) (D131)
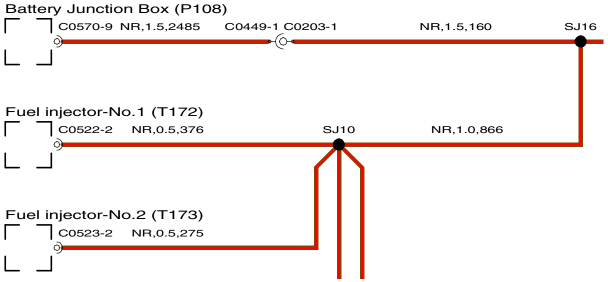
C0331-28
NS,0.35
C0331-7
NG,0.35
C0787-1
C0331-12
UG,0.35
C0787-2
C0331-14
YG,0.35
C0787-3

After each component description, a translation code is displayed in brackets, for example: Starter relay (R102), Engine control-module (ECM)(D131). The codes can be ignored.
Note: A dotted outline indicates that the component identified is not shown in its entirety.

Connectors

Connectors and header joints are identified by their corresponding connector number with a numbered suffix to indicate the pin-out detail of the wire, i.e. C0292-1 identifies connector 292, pin number 1. Wire insulation colours are listed in a table at the end of this section. Where wires have a predominant colour with a secondary colour tracer, the main colour is identified first, i.e. LGS - light green with a slate tracer.

Splices



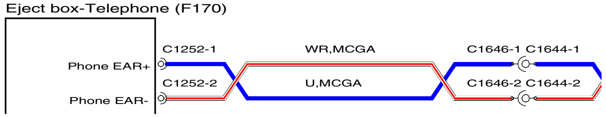
Battery Junction Box (P108)
C0570-9
NR,1.5,2485
C0449-1
C0203-1
NR,1.5,160
SJ16
Fuel injector-No.1 (T172)
C0522-2
NR,0.5,376
SJ10
NR,1.0,866
Fuel injector-No.2 (T173)
C0523-2
NR,0.5,275

The splices (and where appropriate, the header) circuit pages show the full interconnectivity of components and systems.
Note: The splice information shown on individual system circuits is not complete. Always refer to the splices circuit pages for complete information for each splice.

Wire length (Splices, Power and Ground Distribution only)

The wire length (in millimetres) is displayed after the colour and cross sectional area; for example, SR,0.35,480. In this example, the figure, 480 indicates the approximate position of the harness splice is 480mm from connector C2335.

Wire Types

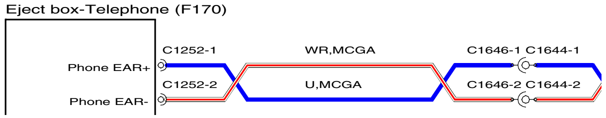


Eject box-Telephone (F170)
Phone EAR+
Phone EAR-
C1252-1
WR,MCGA
C1646-1 C1644-1
C1252-2
U,MCGA
C1646-2 C1644-2

Multicore wires are identified by the prefix M suffixed by three or four other letters, for example MCGA, MAPN. The suffix precisely defines the parameters that comprise the specification of the wire type. The specification is defined during the design process of an electrical system, therefore it is imperative that the correct specification is maintained to ensure the correct operating characteristics and continued functionality for a given system.

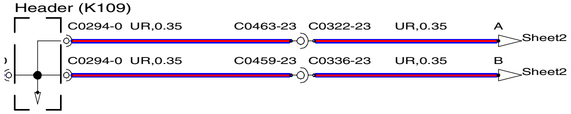
INTRODUCTION

Line Types



Eject box-Telephone (F170)
Phone EAR+
Phone EAR-
C1252-1
C1252-2
WR,MCGA
U,MCGA
C1646-1 C1644-1
C1646-2 C1644-2

Crossed wires as illustrated above show an example of how a twisted pair of wires may be represented on the circuits.



Header (K109)
C0294-0 UR,0.35
C0463-23 C0322-23
UR,0.35
A
Sheet2
C0294-0 UR,0.35
C0459-23 C0336-23
UR,0.35
B
Sheet2

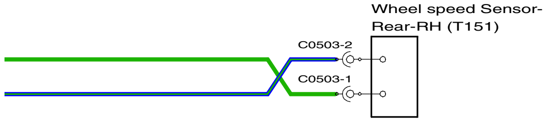
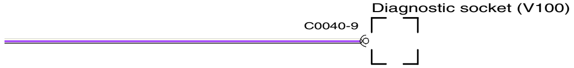
The arrows illustrated above show an example of the page break symbols, identifying that the circuit continues at the corresponding letter on the sheet number indicated.



Wheel speed Sensor-
Rear-RH (T151)
C0503-2
C0503-1



Diagnostic socket (V100)
C0040-9

The cup and ball symbol represents the male and female halves of connector. Most connectors plug directly into a component but some are wired directly to the component using a ‘flylead’ as with C503 above.

Ground points

Ground points are identified with an eyelet symbol and a connector number, except where components are grounded through its fixings, when only the eyelet is shown.
